Now, in regard to wads. Nearly all guns, by actual measurement, are from one to two gauges smaller than they are called. Many chokebore 10s will gauge but 12 at the muzzle. As a general rule, for No. 10 brass shells No. 8 wads are used; for a paper shell, a wad of the same number as the shell. There is also a general opinion that brass shells will give better results than paper shells; but all of my experiments have proven the contrary. Paper shells, loaded with wads same number as shell, and not crimped, will give better results than brass shells loaded with wads two sizes larger than shell. Firm, elastic felt wads are best. The advantage of two wads on the powder is so very little that I have never been able to discover it.

More of the good or bad results of shooting depend on the manner of loading than most shooters are willing to admit. The ordinary way of loading is to use for brass shells wads two or three sizes larger than the gun. The large wads are with some difficulty forced down on to the powder with a close-fitting loading plug, that has either a perfectly flat or a concave end. The inside of brass shells that have been used are very rough, a kind of sandpaper surface. The friction of the large wads is so great that the force of the discharge will bulge the center of the wads forward, and when the wads reach the smaller or true caliber of the gun at the end of the chamber, they will bulge still more in the center—the worst possible condition for good results. The shot will be projected in a circle, and the center of the target will have few, if any, shot in it. The crimping of paper shells has the same effect, but in a much less degree, inasmuch as the wads are smaller.

To remedy this defect in loading, use a loading plug with a convex or cone-shaped end, and for a No. 10 brass shell use a No. 9 or 10 wad on the powder. The wad should be firmly rammed on the powder and lightly on the shot. If two wads are used on powder they should be each rammed separately. The wads will be seated on the powder cup in the best possible shape for good results in shooting and will be less likely to start from the recoil or rough handling. I once made a very poor shooting muzzleloader a very good one by changing the shape of the butt end of the ramrod. The fault of the gun was that it distributed the shot in a ring. The center of the target for a foot in diameter would be almost entirely free from shot. The butt end of the ramrod was very much concaved, and at that time I used very large wads. I reversed the shape of the end of the rod, made it very much convex or cone-shaped. By using this rod the gun was made an excellent shooter, in fact it acquired such a reputation that I sold it for more than first cost, after using it for six years.

I have one more experimental way of loading, which I hope all glass-ball shooters, who think two wads are a necessity, will try. Load a few shells without any wad between the powder and shot. Use a flat-ended loading plug. Ram the naked powder quite hard; then put in the shot. On the shot put one good felt wad. Try this on glass balls, from any kind of a trap at the regular distance. Now don't say that charges loaded in this way will not break glass balls until you have tried them. In my experiments I used No. 9 shot.

Over-charges of powder are a detriment to the good shooting of any gun. Shot discharged from the muzzle of a gun is very similar to water discharged from a hose nozzle. A hose nozzle to throw a solid stream to any great distance must be chokebored, very similar to a chokebored gun. There is a limit to the distance that water can be projected by pressure through a nozzle, and an increased pressure at that limit will reduce the effective distance. There is certainly a limit to the effective distance of the best shotguns; and over-charges of powder will reduce the effective distance from the same cause that an over-pressure will reduce the distance to which water can be thrown.

Heavy or over-charges cause heavy recoil, which is not only unpleasant to the shooter, but detrimental to good shooting. The force of the recoil backward is at the expense of the force of the discharge forward. This fact is very easily demonstrated. Take a gun that weighs 8 to 8½ pounds; have the shells loaded with 5 drams of powder and 1¼ ounces shot. Let some small man, who weighs about 140 pounds and who has more pluck than muscle, fire a few of the shells at a target 40 yards. Then have a large, muscular man, of 210 pounds weight, shoot the same gun with similar charge. The results will be found very different. The heavy, muscular man by his weight and muscle will hold the gun square to the work, and put all the force of the discharge on the projected shot. The small man, if quite active, will keep on his feet, but when he examines his target will find it just as much poorer as the gun kicked him harder than it did the heavy man. There can be a certain amount of recoil that is not unpleasant, but rather a satisfaction; charges just up to that point will be found very effective. Charges would vary according to the weight of the gun, as well as the weight and muscle of the shooter.

I hope good may result by a full discussion of this subject. CALIFORNIA.

Editor Forest and Stream:

One is not a little surprised at the shooting of some guns, and yet when all things are taken into consideration there is nothing wonderful about the targets presented for our inspection; for all, or nearly all, omit to state whether they are made with "standard" or "trap shot." Then they say 1¼ ounces, leaving the reader to guess how many shot that means. A Bridgeport measure gave 556 pellets by actual count, while a Jas. Dixon & Sons' measure showed 566 pellets of No. 8 standard shot, Tatham's make; while by actual count, according to their table, there ought to be only 500 pellets. Then again, the distances that are given must be guessed at and not measured. English gunmakers all adopt a uniform distance and a uniform target, while our American makers do not appear to have either. Some shoot at 45 yards, 24-inch circle, and some at 40 yards, 30-inch circle. Not long since I was in a testing gallery where a man was shooting guns, and I asked him the distance. "Well, we call it 37 yards, but it is just 35 yards, and we use a 24-inch circle." At another time while in a testing gallery I noticed shot marks all along the side where the pellets had struck on their way toward the target; and any one can guess where the pellets had landed or boarded; viz., in the target, and when I was shown a target with 466 pellets I did not wonder so much as before I saw how and where these patterns were made. Only wondered they did not get more.

Greener advertises that every one of his guns are targeted with 1¼ ounces No. 6 English shot that are counted, and that the distance is 40 yards. Not long since I was shown a "shot counter," devised by M. E. Curd, of Cazenovia, N. Y., that will actually count the exact number of pellets in a charge, and do it very nearly as quickly as they can be measured. When asked why this was not used, the answer was: "This is too accurate for the gunmakers, they want to dip up a measureful, well knowing that it gives them a decided advantage." A few days ago I saw a letter from a man who wanted a gun sent him that would put in a 30-inch circle, at 40 yards, 477 out of an actual 499, all but 22 of the entire charge. I fear this man had been reading some of these wonderful targets which are only made in a paper.

Why can't we have a uniform distance and a uniform target, and as 40 yards and a 30-inch circle is used by all English and a good many American makers, let us adopt that. Measure the distance and count the shot, and as No. 8 is the size generally used in America, adopt that, then one can tell exactly what his gun will do and can make a comparison.

Another thing, a man writes to you and wants to know the proper charge to use and what the result ought to be, and you write that it takes a good deal of experimenting to know what a gun will do. Now, right here, I claim that this is the gunmaker's business to determine, and that he has no business (be he who he may) to allow a gun to go out of his shop until he knows exactly what the gun will do, and the exact charge to use in it; and if the distance, shot and target were uniform he could bore the gun so it would do what it should, and compare favorably with any other gun. Regularity as well as closeness is what is wanted, and if a thirty-inch circle is adopted it gives a larger space and will compel the makers to bore their guns for regularity, as well as to secure a close pattern, and this is what every sportsman wants. A gun with a killing circle of thirty inches at forty yards is better for all kinds of shooting than one that only has a killing circle of twenty inches at same distance.

Tell your correspondent "Oct." that if his gun will average 440 out of a counted charge of 500, I will give him five times as much as he paid for his gun.

These long shots prove nothing—only show what a gun may do once in a while. I once owned a 10-bore, 8-pound 12-ounce gun, 24-inch barrels (breechloader) with which I killed two woodcock, one at 60 and the other at 61 yards, with 3½ drams powder and 1⅛ No. 10 shot, by measure. I also killed a grouse with 2¾ drams powder and 1⅛ No. 8 standard shot at 65 yards. These distances were all measured. How many times I failed, would not care to state.

Muzzleloaders, they are, as you state, things of the past. A man here owns one that will kill a dove at 20 rods every time, and yet I can never get him to shoot at a target with me; and not long ago he offered to sell this gun. I cannot imagine his reason for wishing to dispose of so valuable a gun, for if ever your humble servant gets one that will shoot as this one is said to do, it will take quite a goodly sum to purchase it. HAMMERLESS.

Editor Forest and Stream:

I have a 12 gauge, of 8 pounds weight, that I use for all kinds of shooting except geese. The barrels are choked and are 30 inches in length. I load with 4 drams powder and 1 ounce shot. I never vary from this quantity. I have experimented a good deal and find this to give the best results, especially on ducks, which are the principal game of this region. I am pretty sure of ducks at 30 to 35 yards, and I often kill them at 40 yards. For geese it is too light, but for other kinds of game it suits me better than a 10-gauge, as it is lighter, and as I am not blessed with an extra amount of muscle I find the lighter gun preferable after a hard day's tramp. I use metallic shells. I think them better, but not so handy as paper, which you can throw away after using. I carried this arm with me to the Pacific coast last winter and could always rely on it. I hope this question of shotguns will be as well ventilated as the articles on "The Choice of Hunting Rifles," now appearing in your excellent paper. W. H. R.

IOWA.

Editor Forest and Stream:

I believe the simple but uncompromising principle called "inertia" is responsible for all the difference in straight bores. The fault is not in the gun, but the shell and primer. All unprejudiced men will agree that could the breechloader be made to conform to the most approved muzzleloader as respects practically uniform gauge throughout, a conical base for the powder, and the slow ignition of the charge, beginning at the extreme rear, there should be no difference provided the breechloader were strongly constructed and chambered to fit the shell snugly.

I think if the manufacturers would make some of their brass shells with conical base, and put the least possible amount of fulminate in the center of primers, the improvement in shooting would more than counterbalance the increase in weight of shells. I put conical bases in my brass shells several years since, and the improvement in shooting and decrease in recoil are very evident. I can use 5-drams electric powder with 1¼ ounces shot in my 9-pound gun continually without discomfort.

The flame of the primer is driven through the charge, igniting it instantaneously. Hence the increased recoil (to the serious detriment of the "vis inertia" of the gun) and the necessity for more and coarser powder and wider breeches. There is enough energy in a large Berdan primer to shoot a rifle.

In muzzleloaders only a small portion of flame can be forced into the tube, the charge is ignited at extreme rear of the cone-shaped chamber and the shot started gradually, and urged on with constantly augmented force to the muzzle. The Lyman-Haskell cannon on the multi-charge plan illustrates this.

I have observed (in targeting chokebore guns for customers) that the excessive choke, by contraction in muzzle, adopted by many leading makers, unfits the gun for large shot by reason of jamming them so that they fly "wild;" also that it increases the recoil, impairs the penetration, and gathers powder, dirt and lead in the tapered portion. REFORM.

MISSOURI.

Editor Forest and Stream:

For a man who wants a general service gun, for field, cover and trap shooting, a breechloading gun of 8 pounds to 9 pounds weight, 30-inch barrels and 10-gauge, is the proper tool. It will answer for snipe, grouse, rabbits, foxes, ducks and deer if loaded with buckshot. However, a No. 12 gauge is serviceable enough, the odds against it being merely that it will not stand so heavy a charge as a 10-gauge; and of course will not bag the game shot at as often or as easily as the other for ducks and fox shooting. I use a 10-bore, 32-inch barrel, 9½ pounds.

Correct loading can only be acquired by careful observation and practice. Some persons will say, and quite truly, that all guns of the same bore do not call for the same ammount of ammunition. There are exceptions to the general rule; load them to suit their peculiarities. Very light guns with large bores may not shoot pleasantly, because of too much recoil. Load them with a coarser-grained powder and you may find it to your advantage; if not, you will have to reduce your charge, but at the expense of loss in penetration and wounded game. Very diverse results with good guns may be brought about by having the powder charge disproportionate to the shot, or by using very coarse and very fine powder; also, very coarse and very fine shot, by employing more or less wads, varying in diameter and thickness, and setting them home with different pressure or by ramming, or by mixing shot of different sizes, which is the worst of all if you wish for good pattern and penetration. If all these items control the shooting, does it not follow that to load a gun accurately for all purposes requires many experiments and good judgment and great skill.

I see by your issue of Jan. 24 that "Backwoods" considers chokeboring an abomination. I cannot agree with him on that point. There are but few choice guns made in this country or abroad which may not be called chokebores, for the calibers of the barrels are smaller at the muzzle than at the breech. If any person doubts this statement let him

apply the calipers to the Parker, Bonehill, Remington, Scott, Greener and other guns. I am inclined to think that many sportsmen, who have guns of recent make and good shooters, and who call their guns straight-bores, would find them to be on close inspection chokebores; and, in my opinion, the chokebore properly loaded for long-range is far superior to the straight-bore muzzle or breechloader. This is not only an opinion, but experience from severe tests. Keep the ball a-rolling, we are never too old to learn. L. H. H.

Maine.

Editor Forest and Stream:

I am the owner of two fine breechloaders, and believe I know something about them. One of my guns is a 12-30-7¼ English make. It answered every purpose while I was a resident of the South, but after coming to this country I found it too light for game here, which has to be struck a little harder, and the light weight of the gun would not admit of heavy charges. I then ordered a gun of an American firm as follows: Length, 30; gauge, 12; weight, 9 pounds; full choke and chambered for three-inch shell. I was advised by many, and especially by as high an authority as the Forest and Stream, to get a 10-gauge if I wanted to shoot heavy charges, but right there my inborn stubbornness made me stick to my original idea. In due time the gun was received. It was a thing of beauty. For swans, geese, snow geese and ducks, I use 5 ounces Laflin & Rand, No. 6 and 1¼ ounces shot, and the game must be over sixty-five yards or I will bring it to bag three times out of five. For ruffed sharptail, blue grouse and teal, I use 3 ounces powder and 1 ounce shot, and can kill far enough to satisfy any one. It shoots as well with 2⅝ as with 3-inch shell, but I have to use 3-inch shell for heavy charges. Recoil can scarcely be noticed, especially in wing-shooting. I have never targeted my gun, neither do I intend to. I know what it will do on game, and do not fancy firing at a board. I made a shot at a swan which fell dead without a flutter at sixty-five paces, and as it must have been 100 feet high when struck, the distance can be easily calculated. I made this shot with 5 drams powder and 1¼ ounces No. 1 shot. One shot went through the head and four through the body.

I once had the pleasure of shooting a Purdy gun which cost its owner over $600, and as far as shooting qualities are concerned I would not exchange with him. If "Buckeye" will address me as below I will tell him where to spend his money, so that he will never regret it.

Bitter Root Bill.

Missoula, M. T., Feb. 16, 1884.

Editor Forest and Stream:

In regard to the performance of shotguns, perhaps my experience during past two years will explain why some breechloaders do not come up to the expectations of their owners. About two years ago I purchased a 12-8¼-30, modified and full choke respectively. This gun worked admirably for pigeons at 30 yards rise, but for field work was very unsatisfactory. It took a full season's experience in the field with various combinations of shot and powder to convince me that for cover shooting close-choke would not do. Since then I have been using a 12-7¾-30, open and modified choke respectively, with much more satisfactory results.

W. H. C.

Philadelphia.

Editor Forest and Stream:

Not being a gunsmith, but having sufficient knowledge of the business to enable me to do my own repairing, I desire to add my testimony with regard to pattern at various distances. My gun is a 30-inch, 12-gauge breechloader. With 1¼ ounces of No. 3 shot, at a distance of 33 yards, 185 pellets were put into a 12-inch circle; with the same charge, at a distance of 40 yards, I put 280 pellets into a 20-inch circle. The distance was measured and shot weighed in each instance. Can this be excelled, and if so, in what manner?

D. H. S.

Rushford, N. Y.

Editor Forest and Stream:

Have any of your readers experimented to determine the values of different lengths for gun barrels? What practical (not theoretical) advantage has a 32-inch barrel over a 28-inch barrel? And what are the limits of length and brevity? I hope that this note, which I write because I am in need of the information, will meet the eye of some one who can help me. Senex Septimus.

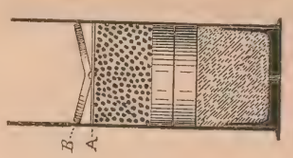
Editor Forest and Stream:

My friend Dr. R. has, for the past twenty-five years, used a No. 10 bore, double-barreled muzzleloader, which has been regarded by judges as a No. 1 shooter. When breechloaders came into use he and I made a number of tests between his old gun and various makes of the new pattern, and in every case the comparison was in favor of the muzzleloader. The breechloader, however, usually did closer shooting but lacked force. This was particularly noticeable when a less than No. 10 gauge was used.

Great improvement has been made in the shooting quality of the breechloader within the past few years, and we have made but one recent test and that was decidedly in favor of the breechloader. My friend was induced to exchange his old gun for a fine-looking breechloader of the same bore, but after giving it a trial he longed for his old stand-by and went back and purchased it. He then tested the two guns duck shooting on the Potomac, and finally admitted that his new gun would shoot both stronger and closer. He objected to it, however, because of its kicking qualities, sold it to me, and is now looking for a good breechloader that "won't kick." My gun is No. 10 bore, 32-inch barrel, weighs 9½ pounds. Since I have been using it I have compared it with eight or ten muzzleloader guns at a target 40 yards distant, and I succeeded in putting twice as many shot within a described circle as any one of the muzzleloader pieces. For general shooting it is hard to beat, and I would advise "Buckeye" to procure a No. 10 gun, for I am quite sure it will give him greater satisfaction than No. 12. It has always seemed to me that the criticisms and condemnation of the breechloader were in a measure prompted by a degree of prejudice. Our old sportsmen have become attached to their tried and faithful fowling pieces, and no doubt this attachment does at times influence their opinions.

Keystone.

Washington D. C.



Massachusetts.—Danvers.—Quail and partridge wintered very good here, although it has been very cold for them. Foxes and rabbits have been very scarce around here this season.—J. F. D.

MUCILAGE-EDGED WADS.

Editor Forest and Stream:

My attention has just been called to an article on mucilage-edged wads, which appeared in your last issue. The only patented adhesive wad known to me is one patented by myself, which I have subjected to severe tests for two seasons, and now, as improved, I believe it to be cheaper and far superior to any shot-retaining wad on the market; and it will retain the charge quite as well in a brass as in a paper shell.

I herewith inclose a sample and a sketch showing its application: First, a thin disc or wad, A, is seated over the

shot. The wad B, scored one-half its depth to allow for bending up, is now dropped into position, the scored surface downward, after first wetting it with the tongue or a sponge. You will observe now that if seated with an ordinary rammer the gum will adhere to the walls of the shell at the points desired, and the two halves act as a brace, holding the charge securely in place. The two cut out spaces act as very important factors, as without them the wad would not drop freely into the shell, consequently the gum would rub off, when it would be of no use; hence we use a thin disc first on which to seat, and this prevents the shot from falling through the spaces. The fault with the process named by your Baltimore correspondent is, it has too many "frills," more, in fact, than crimping, while this of mine has none and cannot be excelled for cheapness, simplicity and general excellence. Falcon.

CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

Now that the ammunition question is being rapidly settled, will not some of your correspondents give us their ideas as to the best shape for the butt-plate of a hunting rifle. My own preference is the one used on the Springfield army rifle.

Greenhorn.

New York.

Editor Forest and Stream:

I noticed in your issue of Feb. 21 an article written by "G. F. W." on a subject which I have been studying some time; that is, the manner of igniting gunpowder so as to burn the whole of it, thereby gaining the full force of the charge.

I have a few shells of different sizes that I altered by inserting a small tube inside so as to conduct the fire from primer to the forward end of powder, which I find answers the purpose exactly. I sent a diagram of it to the Winchester Arms Company, and they said it was an old invention and discarded long ago. I think if "G. F. W." will try this he will be satisfied; in fact, I don't see why the shell makers have not tried it before, as it seems to be the only proper way of igniting the charge. J. L. DeH.

Massachusetts.

TENNESSEE NOTES.

THE shooting season of 1883–4 has proved almost a failure here for lovers of what is termed by some "legitimate sport." The rains of November and December, and the heavy snows and floods of January, have kept the birds in the woods and thickets, where wing-shooting ceases to be a pleasure. During the snows large numbers of quail and hares were bagged by pot-hunters, and larger numbers of the former were trapped. Very few ducks have visited us this winter; in fact, this has been the case for two or three seasons. Geese have been plentiful, but few have been shot. No one here ever shoots over decoys or makes any systematic pursuit of geese, such as are killed being from flocks that are accidentally approached by, or come near to, some party of duck hunters. At present the river is out of its banks, and all the bottom fields and woodlands are overflowed. This is the pot-hunter's golden opportunity, as hundreds of hares and quail can be found upon the mounds and stumps in the back water, where they fall easy victims to the pot-metal shotgun or antiquated musket. The game law is not in force in this county, public sentiment here being almost unanimous in its opposition to legislative protection for game.

A few foxes and otters, several beavers, and multitudes of raccoons have been trapped here this winter. There are parties here who make good wages trapping, as minks and 'coons are very abundant. There were a few snipe here this fall, and three were killed within the town limits on the 5th of January.

This is later (or earlier) for snipe in this latitude than I can recollect observing before. I think if the waters subside before the middle of March we may have good snipe shooting on the muddy flats left by the receding waters.

Will.

Savannah, Tenn., Feb. 11.

THE SQUIBOB BEAR MACHINE.

Editor Forest and Stream:

I cannot tell you how glad I am to hear of my old friend, J. B. Squibob, through your correspondent, "Moss Back." So he is about to bring out his bear-trapping device with which he was experimenting when I last saw him, long and long ago.

I wonder if he would forgive my telling the result of one experiment. If you think he would not, pray keep it to yourself, and publish it not in Gotham nor tell it in the streets of Chicago.

J. B. S. had stuck up his ground and greased his tree, and had just set his bait when he "lost his holt" and came sliding down "on the run," as we Horse Marines say, and that part of him which was best acquainted with a chair stuck fast in the lime of his own setting. It could not be said of him that he was "hoist with his own petard," but rather, had sat down upon it, and it would not hoist him, nor could he hoist himself. This, however, was but little compared with what followed. A bear scented the bait and came rushing to and up the tree for it. Half way up his claws slipping, he came down plump on top of my friend J. B. S. with the ponderosity of one of Richard Grant White's jokes, and the days of poor Squibob would have been then and there ended had I not been at hand to finish the bear with my hunting knife, and with it cut my friend loose, who escaped with no greater loss than some wind squeezed out of him and the seat of his leathern breeks.

I am truly glad to know that he still lives and is as fertile of inventions as ever, whereof I was always barren. If any of these words come to his sight I hope to hear again from my old friend. Yours in the cause of truth,

Major Joseph Verity, U. S. H. M.

Adironda, Feb. 30.

An Old Hunter.—Riverhead, N. Y. Feb. 26.—The Long Island Hunters' Association gave a dinner in Terrace Hall this afternoon. More than 200 hunters of all ages were present from all parts of the island. Dozens of hunting dogs lay about under the tables, and guns leaned in every corner. The old hunters told marvelous stories of the number of deer and foxes they had shot, and the younger ones wished that rugged experience had enabled them to tell such stories with equal grace and confidence. The Association was organized fifty years ago for the purpose of protecting the Long Island deer, which were already fast disappearing. Twelve men got together, made a clearing in the midst of a thick wood, and planted it with green truck of all kinds. This was done to attract the deer. It was also agreed never to shoot them in that vicinity. The deer at first accumulated rapidly in that section of the island, and their disappearance was delayed. This hunter's garden has been planted regularly each spring ever since, and at harvest time what the deer have not eaten is cut down and ploughed under. The planting and harvesting of the crops is made an occasion of festivities among the hunters, who accompany their agricultural pursuits with picnics and hunting parties twice a year. At the last meeting, in October, it was resolved by the Association to present an appropriate silver medal to Mr. Wells Tuttle, the president and founder of the Association. Mr. Tuttle is now nearly 90 years old, and is the only survivor of the twelve deer apostles, as they were called. The object of yesterday's meeting and banquet was the formal presentation of the medal. Mr. Tuttle, in spite of his years, told more remarkable fox stories than any one else, and indulged heartily in clam chowder and other good things provided. He sat in a large rocking chair on a raised platform, the background of which was decorated with old flint-lock rifles and stuffed specimens of Long Island birds and beasts. His eyes sparkled with pleasure, and he applauded many of the speakers. The presentation speech was made by Judge Thomas Young. The Judge was applauded with especial emphasis because it was known that he was uttering the sentiments of the aged president. "All that remains of the good old time," said he, "is the dog. Nothing can spoil him. When I see a lot of dainty boys dressed up in white breeches and red coats, mounted on small horses and chasing an anise-seed bag across country, I can find no word in the English language small enough to express what I think of them. How I pity the able dogs that they press into their service. What a pity such superior animals should have to keep such company." Old Mr. Tuttle remarked that he could shoot better with his gun than he could with his mouth, and asked one of the young hunters to respond to the address for him. Mr. R. M. Bayles, of Eastport, did so. The other speakers were Surrogate James H. Tuthill and Mr. George F. Stackpole.—*Sun.*

Long Island Duck Netting.—Good Ground, March 1.—*Editor Forest and Stream:* In your last issue in reply to my notice that ducks were being caught in nets, you advised me to notify the game protector. Now, this thing has been going on for years, and I have been informed by reliable parties, who reside in the vicinity where the netting is done, that the same parties last fall caught in Shinnecock Bay over 7,000 ducks. As I said before, the bay is now full of ducks, and, of course, the netters being so successful last fall, this has brought more netters into the business, and they are now catching from 1,000 to 1,500 ducks at a run. If the business goes on the birds will soon be all caught up and driven away. Not only are they caught in nets, but they are shot nights on their feeding ground. I have notified Mr. Whittaker at two different times, and he has paid no attention to it; and the netting and night shooting go on. I have tried to stop it on my own marshes, and succeeded. We ought to have a game protector who understands the bay, and who is not afraid to go ahead and have the first man arrested who is caught. I could name a man who would take care of the game in the bay if he could be appointed game protector. If this thing is allowed to go on every man living around the bay will in a short time be netting ducks. I think it would be a good thing to have a law passed prohibiting the setting of gill nets on the feeding grounds of ducks. There is no fish to catch at the time ducks are here. I am nearly done with trying to protect the game alone without the help of any one, not even the game protector, who is appointed expressly to take care of the game.—William N. Lane.

Michigan Deer Skins.—Boston, Feb. 26, 1884.—*Editor Forest and Stream:* I have lately returned from a business trip West, and on my way stopped during the early part of the present month at Detroit, Mich. While in the warehouse of a merchant there I commented on quite a large-sized pile of deer skins, and was informed by the owner that there "are over 3,000 in that pile," and "we have already shipped 5,000, and shall handle fully 10,000 this season, every one of which was taken from deer killed in Michigan." I suppose this will be no news to you, but to me it was simply astounding. This merchant is not the only one who deals in deer skins in Michigan and ships them out of the State, but is probably the largest.—A. P.

Bounty on Foxes.—Waterville, N. Y., Feb. 18.—At a meeting of our local sportsmen's club held last Friday evening, a resolution was introduced offering a bounty of one dollar for each old fox killed by residents of our two adjoining towns. After some debate, as the idea was a new one to many of our members, the motion was carried. The plan seems to be a good one, as a few old foxes will create more havoc among our upland game than all the guns of our sportsmen and market hunters combined. Were this plan acted upon by all the clubs throughout the States, I believe we should find a noticeable increase in the number of our game birds.—N.

DEER IN VERMONT.—It will be remembered by our readers that some years ago a party of the citizens of this and adjoining towns subscribed a sum of money for the purpose of placing a number of deer in the mountains with the view of trying to re-stock the woodlands of the State with these valuable and beautiful game animals. The deer at that time were protected by a law which expired by limitation in 1880. The Legislature of that year, however, re-enacted the law and extended its provisions, the expiration of the new law being Nov. 1, 1886. The deer so placed have, it is believed, increased in such a manner as to afford good ground for belief that the experiment will be successful. Rumors have been heard from time to time that deer had been unlawfully killed, but no direct evidence has been produced until yesterday, when a young lad living near Bald Mountain gave Mr. J. C. Dunn, one of the gentleman who was most active in the enterprise, information which led to the discovery of a dead deer, which had evidently been shot by some miscreant who luckily, however, failed to reap the fruit of his infamous act. At the time the deer were turned out a reward of $50 was offered for information leading to the conviction of any person who should kill, take or pursue them, and this offer is still good and the money will be paid to any one who will furnish information upon which the person who killed this deer can be convited. Information may be given to Mr. J. C. Dunn, M. G. Everts, F. Chaffee, A. F. Davis, Geo. H. Cheney, H. W. Cheney, Dr. C. W. Brigham, Hon. D. W. Taylor, S. E. Burnham or Wm. Y. W. Ripley. The offer of the reward is yet in force, not only as far as it concerns this particular animal, but also others who may be killed hereafter—in fact it is a standing offer. That all may know just what the law is we publish the full text below: "A person who prior to the first day of November, 1886, pursues, takes or kills, within this State, a wild deer, or has in his possession a wild deer or any part thereof so taken or killed, shall be fined $50, and the possession of the meat or hide, or any part of a wild deer, shall be presumptive evidence that the person having it in his possession is guilty of a violation of this section. It shall be lawful to kill a dog found pursuing wild deer prior to November, 1886, if such dog is killed while in the actual pursuit of deer—*Rutland (Vt.) Herald, Feb.* 29.

MORE CAT.—As cat stories seem to be in order just now, "that reminds me" of another cat that was not killed. Some years since a handsome maltese cat, having been sentenced to death for catching young chickens, I was requested to officiate as her executioner. The instrument of death selected was a new repeating rifle, to whose sights I had not become accustomed, and which had never yet drawn gore. "To make assurance doubly sure," I tied a rope around pussy's neck, and fastened her to the garden fence; I drew a careful (?) bead on her head (distance five yards) and the way pussy backed away and stretched the rope, she anticipated her fearful doom. Bang!—I saw a blue streak disappearing "over the garden wall," and found that like Alexander of old I had "cut the Gordian knot," not with my trusty sword, but with 40 grains of powder and 200 grains of lead. In a word, the rope was shot, the cat was free. To cap the climax, my neighbor, "Old Muzzle Loader," had witnessed the scene and remarked, "Didn't I tell you the trajectory of your new-fangled repeater is too high?"—BOBOLINK.

RUFFED GROUSE CAPTURED ALIVE.—Orwell, Vt., March 2.—Last week, while two men were chopping, they captured a partridge in the wood pile. Tying a string to its legs, they hitched it to the fence, where it died during the afternoon, having pounded itself to death. Fox hunting has been good this winter, the greatest number killed by one hunter being sixteen.—W. L. P.

CONNECTICUT.—The Senate Committee on Agriculture have reported adversely on all proposed game law changes.

Sea and River Fishing.

DOWELS AND FERRULES.

FOR his blow at that ancient superstition, the dowel pin, Mr. Wells deserves all praise. If the subject had been thoroughly discussed, they would have disappeared before this. Twenty years back, Thaddeus Norris—than whom a better American angler and rod-maker never lived—condemned them unhesitatingly, and stated that he never used them. But there are some points against both them and the present style of ferrules, that neither he nor Mr. Wells in his article have touched upon. They are the cause of the present article.

First—As Mr. Wells has shown, the greatest points of strain (*i.e.*, transverse strain) are at the juncture of the wood with the lower end of the female and upper end of the male ferrules. For, as the rod begins bending at the tip, the transverse strain is thrown further and further down the rod, the strain becoming more longitudinal upon the bent part. But as the strain progresses down the rod, it strikes the ferrules; but the ferrules cannot bend, therefore at their junction they act as a lever against the wood, and the longer they are the greater the strain. Every one can see this, and it is therefore plain that those parts of the rod should be especially strong. But you will ask, what bearing has this upon the dowel pin and tenon? Why, simply this: It is evident, to reduce the strain as much as possible, we must shorten the ferrule, and if we shorten the ferrule and retain the hole for the dowel, we bore away the wood at the very place where we need the most. And there is still another grave objection. Wood is porous, and by virtue of capillary attraction will suck up moisture. This moisture rots and weakens the fibers of cellulose tissue, of which the wood is composed; therefore we varnish our rods to keep it out. Now, woods of all sorts exert their capillary force strongest in the line of the grain. That is, wood will drink up moisture faster when a cross section of the grain is wet than in any other way. The reason of this is plain, when we see that the interstices of the fibres are really minute capillary tubes, which draw the water up. Now, the dowel hole in almost all rods has no covering to prevent this; it is impossible to keep its side well varnished, and the dowel pin would soon wear it off if we could. So, whenever we get moisture into the hole, and it is almost impossible to avoid this, it acts as a little cup, to retain and draw moisture into the pores of the wood, weakening and rotting it at the point where we want it strongest. To rods which have a waterproof cup for the dowel pin this objection does not apply, but the former one does. So far as we know, however, there are no wooden rods in the market which have this cup, and only one make of split bamboo, and this latter objection is doubly strong against the latter, because bamboo is not only more porous than other woods on its cross section, but there is also the glue to be spoiled by the capillary attraction.

Second—It strengthens the joint, is claimed for it. It does no such thing. The leverage in the ferrule itself is brass against brass, and as Mr. Wells has shown, even thin brass is amply strong. How many ferrules split or collapse in comparison with the number of rods that break the wood at the junction with the ferrule?

Third—It is claimed that it holds the joints together. This assertion is also false. Look at your own rod, and see which shows the most signs of friction, the wooden dowel or the

brass ferrule. It is evidently the friction of the lip of the female ferrule upon the tapered male ferrule that holds the joints together. If it were the friction of the tight-fitting dowel, when the brass became worn we should have to trim the whole thing down, whereas this, practically, never happens. The dowel hole is always made too large for any friction, to prevent the joints sticking from moisture.

As the summing up of this article, I would like, with all due humility, to submit the following design, which will cover the above objections:

The above figure represents the joint cut away to show a longitudinal section. It will be observed that at A and B the wood is full size, thus getting the greatest amount of fiber, to resist transverse strain. Some ferrules are already made this way, and they are the best in the market. I shows a round wad of brass, cut to exactly fit the bore of the ferrule. It is pushed down ahead of the wood, to which it is fastened by shellac, till it comes to the shoulder. It prevents all moisture getting at the cross section of the wood and weakening it. The dotted lines show where rods usually break on this account. It will also be observed that the male ferrule is also capped with brass, as shown at D, for a similar reason. This cap could more conveniently be made a solid part of the male ferrule, and I have so represented it.

To prevent unjointing and the nuisance of throwing away a joint or two, I have shown at C a little brass cleat, fastened to the rod by silk lashings. A similar one is put on at the lower end of the female ferrule, pointing in the opposite direction, and a few turns of silk, taken around these, prevent all accidents. This is an old device and a good one.

The proportion of parts in the figure is exaggerated to show them more clearly. These ferrules could be made very short to lessen the leverage.

I should be glad of any criticisms from other anglers. Everything to forward the angler's art, should be the angler's motto, and in this spirit I have writen. PERCYVAL.

A MASCALONGE.

MANY years ago when a boy my father and myself were devoted disciples of the rod and line. Few, if any, could equal the old gentleman either in handling a fish, or in the number in his basket at the end of a day's fishing in the St. Lawrence, that most beautiful river. Where we fished, bass, pickerel, pike, and now and then a mascalonge were to be caught; but the story I wish to tell is of a mascalonge which my father and myself attempted to capture, and we tried it so often that we called him the "one-eyed perch."

On a bright day in June the pater suggested to the writer that a few hours spent on the river would be pleasant, and that he get the boat and fixings ready. Away scampers the boy for the river bank; the boat is washed, the paddle and oars are soon in place, we step in, and away for the second island, round the head of it we go, and down the south side with a six-mile current helping us on, the big copper spoon towing behind us sixty yards away. Down around the island we go, pulling slowly but moving swiftly, when, as if struck by a streak of lightning, the flat-bottomed scow rises on a wave and we are in the middle of a riffle, well known to lovers of bass fishing.

"Pull," cries father, "and we will make the foot of the island;" and pull it was for some ten minutes with current setting us down the river, and the long line and spoon dragging behind. At last we catch the eddy, and then the veteran in the stern says: "We will pull along that bank of rushes and I think we will find a fish near the end of the island." So we move on slowly for a hundred yards or more, when "Make her move" comes from the stern, and the boat moves along briskly, the oars just touching the rushes, when as we near the point I hear the magic words, dear to every angler's heart, "I've got him!" Then the boat stood still. "Pull, pull, boy!" cries the old man, and I labor at the oars for all I am worth, until nearly black in the face, when I see a shining object rise from the water some five feet or more distant, and with a splash it disappears, to rise again and again. Still it is "Pull, boy, pull!" and away we go from the rushes and twist and turn in the eddy of the island till we think the fish is tired out, and father begins to haul in, when whiz goes the line through his fingers, which are cut to the bone. "Stop," he cried, and I rest my weary arms for a second or two, when I notice a look of pain, disgust and anger on the old man's face as he says, "Bless him, he's gone!" and sinks into his seat. Presently he hauls in the line and behold the hook, a good large one, is straightened out. That is enough fishing for one day, so we pull home, sadder if not wiser.

The soldering irons are got out, and ere night closes in, we have a new and stronger hook fastened to the spoon, and are ready for the "one-eyed perch." Some days elapsed before we could get away again, but at last we are off, and go down on the north side of the island; we round the point of rushes, and come with a long, steady stroke past the hole where we hooked him before, but without getting a rise; so on to the southern end of the island and back again. "Steady, boy, he ought to be here!" and here he is, as I feel the boat cease moving in spite of my efforts to keep her going. "Pull from the rushes!" and pull it is; slowly the boat moves, now the fish makes a rush toward us and the boat flies as fast as young muscles can make her, till we strike the two currents meeting at the northeast end of the island. Then right about we go with the fish, now in the water, now out, pulling like a devil possessed, now to the right, now to the left of the boat, and sometimes under it, but the line kept taut. At last, tired with his efforts, he is brought alongside. "Get the gaff," but alas! the gaff was left behind, "Shoot him!" and I spring for the old muzzleloader in the bow, when with a last desperate effort he plunges below the boat and is gone! Then the old man sat down and wept (swore) in French.

We tried to catch this monster of the deep until we had hooked him seven times, the last of which was but a repetition of the two first attempts with only this difference; this time he took away with him thirty yards of line, and the following morning he was caught some five miles lower down the river on a night line, with which he had entangled himself. He was sold by the fishermen who caught him to the "Lord of the Manor" and weighed thirty pounds. We recovered the spoon and line, and had lots of sport with the spoon afterward. CANUCK.

VICTORIA, B. C., Feb. 2, 1884.

HINTS AND WRINKLES.

Editor Forest and Stream:

I have just read with pleasure the article on dowel pins, by Mr. Wells, in your issue of the 21st.

Three years ago a friend took up rod-making as a winter pastime and turned out three or four rods that were, and are yet, equal to anything short of a split bamboo. The dowels bothered him, and thinking the matter over, neither he nor the friends whom he called into council could find any *raison d'etre* for them. So the rods were finished without dowels, and we cannot see that anything has been lost in any way.

Many thanks to Mr. Wells for the suggestion regarding rod handles. I for one will try it, and I have so much faith in it that I shall use it on my best rod. We anglers want more such points. Almost every one of us might do something. We are, all of us, or a great many, at least, indebted to the FOREST AND STREAM for hints and wrinkles of which we have made use, and yet I suppose not one in ten have ever acknowledged them or tried to give other points in return.

Here is a little one that helped four of us on Spider Lake some years ago. We found a splendid place for bass one day and caught some beauties, but we had no landing net, so that the biggest one generally got away, until some one thought of making a gaff with a lake trout hook. Simplest thing in the world! We just took a three-inch Limerick hook and lashed it to the end of a three-foot switch and lost no more bass for want of a landing net. Such a hook can be carried in the fly-book, and when you unexpectedly fall in with big fish (no joke) why there you are!

And this leads to a question I have wanted to ask for a long time. We have all read time and again of a bass when hooked leaping from the water and falling on the leader so as to break it. How does he do it? If both ends of the line were fast I could understand it, but they are practically loose. For experiment: Fasten the hook to the floor and let the rod be held so that the line will be at about the same angle and tension as when a bass is about to leap. Now drop a ten-pound weight on the leader two or three feet from the hook. The finest gut will stand the test. I know how they shake the hook from their mouths when they get a slack line and that the gut does sometimes break when they leap, but do they break it by falling on it, or by striking it with their tail? I don't think so. J. G. W.

CANADA.

FISHING AND FISHERMEN.

HAVING been inspired on several of these warm and spring-like February days, my mind has been stirred from its alpha to its omega along the line of the past as touching the streams I have waded, with rod in hand, and the boats I have sat in on the rough or smooth rivers and lakes, as the case might have been, waiting with my attractive lure for a bite.

None but a born fisherman can enter into the sport. None but a follower of Izaak Walton can climb and wade from early morn till dewy eve over hills, through vales, and call it sport.

He only can sit by the fireside while the last snow of winter is falling and extract the profoundest comfort out of the by-gones, as the fly-book is turned leaf by leaf and each crumpled, feathered hook is eagerly examined and the history of them read, telling how a three-pound trout played havoc with the cowdung, the red ibis, or the king or queen of the water; how some great black bass, or tremendous salmon spoiled this or that fly in such a year, and wondering, as the light blue smoke of the companionable pipe rises in dainty cloudlets above our heads, if the like will ever occur again. Hope, in a whispered prayer, bubbles over the lips from the depths of the heart, and trusts that the all-wise Providence that created the beauties of the streams and the deep, who also established in our souls the desire to enjoy—as only we fishermen can—the greatest of pleasure, of a spring and summer time, with rod and creel, may not blast our hope, or leave our cravings for the beautiful unsatisfied.

In the week that has just past, my mind has retraversed all the brooks, rivers and lakes, where joy came to my heart over the line and rod, as it only can be telegraphed to the sportsman who had it born and bred in his bones. One unpleasant reflection I called to mind wherein I got a severe flogging from my father for leaving my work to go fishing. He told us if it rained we might go. It sprinkled a little from a cloud not larger than a man's hand, and away my brother and I ran for the charming Susquehanna. We were checkmated on the banks of a brook by a switch that somewhat resembled a modern trout rod, wielded by him who was not born as we were, with more love for angling than manual labor. That whipping no doubt decided my future. I soon began the study of physic, and ere long I bade adieu to brush and stones, and the hardships of the old farm, and took up my abode near the beautiful Cayuga Lake, in the city that boasts of the college upon a hill, founded by the late lamented Cornell. After my departure, all my brothers but one followed, and to-day four of us are fishers for patients in the winter and muddy spring, but the desire which our father tried to check when we were young has, to all appearances, intensified, and must yearly be gratified.

There is no more beautiful village than Ithaca, not a more beautiful body of water than Lake Cayuga. The several streams that empty into it and the grand falls, of Fall Creek and Taughannock, the cascades and rocky shores of Six Mile Creek add to the beauty and grandeur of this vicinity. The fish and game clubs here are alive to the stocking of streams and the protection of fish and game. We expect 60,000 California mountain trout this summer for our streams in Tompkins county. Last season we took several California trout on bait and fly in Fall Creek and the Inlet Creek. Dr. Sharp caught a California salmon under the falls that weighed two pounds. This beautiful specimen showed much pluck and endurance in the fight against the line and rod. The mountain trout were put in the stream one year ago last summer, and when taken by C. B. Brown measured seven inches in length, and acted quite as gamy as brook trout of the same weight.

Our lake abounds in small and big-mouthed black bass, wall-eyed pike, perch, pickerel, swamp pickerel, bullheads, rock bass, salmon trout, California salmon, eels, suckers and herring. Black bass have been caught at the head of the lake weighing six pounds and a quarter by E. C. Van Kirk and a Mr. Grayer with minnows. Dr. Fowler caught one bass on a fly, that weighed four and three-quarter pounds. The writer has frequently taken on a fly and with bait twenty to thirty pounds in a forenoon or a part of the afternoon.

Several years ago I caught five salmon trout before 10 o'clock A. M. I with my oarsman got on the water about 6 A. M., and before we had gone one hundred rods below McKinney's I hooked a beauty; going once over the water from this point to Bloom's bar, and through Burdick's Bay, the five beauties were secured. They all took a Canandaigua spoon, leaf shape. A friend came from Bradford, Pa., and went out with me. I rowed the boat for him to fish, which I have no love for, and after an hour of faithful trolling he gave up in despair and handed the line to me. We had not proceeded far in Burdick's Bay before I struck something so solid that I called to my friend to stop the boat, as I had fear of losing my line, thinking I had caught a slab. As soon as the boat slacked I felt the object tugging at my hook. I remarked that whatever had hold must be alive, as the movements were really like a monster fish. I cautiously took up the line, keeping it taut, and after some anxiety and trepidation, saw fifty feet away in the clear water a sight that sent a thrill through every nerve. "A ten-pound trout," I cried, "Oh, he's a bouncer, Mr. Welles; hold the boat steady now; keep an eye on the fish when he comes near the boat and turn the stern away sufficiently to allow me to lift him in without touching the gunwale." He did so in a masterly style, and to our great joy we secured a salmon trout that weighed eight and one-fourth pounds. After our knees had got over trembling, and our palpitating hearts steadied down a little, we went over the same water and took another that weighed five and three-fourths pounds. We went home the happiest of men; envied by all.

The late Dr. Bristol, of Syracuse, went with me on another occasion and we captured five salmon trout and one wall-eyed pike. Their weight we did not take, but such a fine basket of fish is seldom taken from any inland waters. The beautiful cottages that dot the shores of Cayuga in the summer time are most charming to view from the decks of the passing steamers, steam and sailing yachts. If any one who reads this article wishes to spend a few of the hottest months in the year profitably and pleasantly, come.

Onondaga Lake is a clear, deep body of water, near the city of Syracuse; is well stocked with small and big-mouthed black bass, glass-eyed pike, wall-eyed pike, pickerel, perch, bullheads, catfish, eels, and the finest whitefish in the State. The writer has caught many a fine creel of the fish of this lake with fly, bait and spoon.

The most killing flies for Onondaga Lake are the R. W., John Mann (resembling the bee), Ferguson, Lottie, black, Montreal and a black body with white tip wings and tail—the name I have forgotten.* I have had good success now and then with a red wing and green bodied fly, gold tinsel—never knew the name.† The last pleasant time casting the fly on this lake was in company with Reuben Wood, of Syracuse, who died a few days since. Mr. Wood was one of the most accomplished fly-casters I ever saw handle a rod. He was, as the wide world knows, an expert. He needs no eulogy from me, for his name stands among the highest as a successful fisherman, and what is still grander than all, as a man; he excelled in gentleness, generosity and integrity. All who ever met him on the banks of a trout stream, or wherever a fish could be lured to a fly, must have been impressed with his true manhood and genial disposition.

Lake Oneida is one of the most natural waters for fishculture in any State. The water is not so clear as that in Onondaga, Cayuga, or Senaca lakes. Thousands of acres of bottom, covered with weeds, exist at both ends of the lake, and along either shore the water is but a few feet in depth in many places, and the grasses, or water weeds, are often above the surface. There are several small bays in which the fishermen have grand good luck in capturing big-mouthed bass, pike (glass-eyed), and pickerel. I caught 75 pounds of bass, pike and pickerel, including a 12-pound catfish, in little more than half a day last summer, with trolling spoon. Charles Preston, of Syracuse, and the writer, caught 63 pounds of big-mouthed bass, pike and pickerel, over 30 pounds of bass, there last summer, in a few hours. The bass would average over two pounds and one-half each. The best time to go to Oneida Lake for trolling is in the month of June and the early part of July. About the 15th of July the eel lifes cover the water and the fishing is not good until past the middle of August. Small-mouthed bass can be taken with a fly in June at the eastern end of the lake, and at West Porte.

On the Susquehanna River, last summer in the early part of July, a party of gentlemen from Elmira and one from Ithaca and myself took passage in flat-bottom boats, leaving Elmira at the early hour of 3 A. M. With lamps and lanterns in our several crafts we passed down the crooked Chemung, looking much like a fleet of Indian canoes bound for some distant point to make an attack upon some hated foe. The breezes that caused our lamps to sputter filled our sleepy eyes with pungent smoke, and when daylight appeared we all might have been taken for boys who had just returned from a fishing tour instead of a happy lot who were just leaving home for a grand time and a glorious summer vacation. The water was muddy, the river swollen and the current rapid, so we traveled at a great speed.

As the sun rose bright and lovely over the eastern hilltops, a view grand in the extreme presented itself to us in one continuous panorama as we floated on. Like a kaleidoscope the changing scenes came and went hour after hour, till we landed at Tioga Point, below Athens, where we met a party made up of gentlemen from Waverly and the neighboring towns, with a large flatboat. We all pulled out together and floated and fished till we arrived at Towanda, Pa., about 4 P. M.

The islands in the Susquehanna, between Tioga Point and Towanda, presented a beautiful aspect, almost tropical in appearance. The wide spreading branches, covered with vines and flowers, lent a perfect charm. "Oh, how beautiful!" was upon every one's lips. Those who had been shut up in the dust and peculiar smell of the cities were transported with ecstacy. Who has not been charmed as we were, on many an occasion, with nature's beauty—the smell of new-mown hay; the eyes feasting upon the harvest, all nearly ripe for the reapers; the vine-clad rocks and blossoming islands; the songs of wild birds—all gloriously lighted with vertical sunbeams and a cloudless sky? The charm was as complete as complete could be.

Arriving at the hotel in Towanda, we startled the denizens with the fine display of bass and wall-eyed pike on our string. I took one of the latter of seven and one-half pounds with a perfect revolving spoon. One eight and one-half pounds was killed by a man accidentally while crossing the river. He put down his pike pole and thrust it clean through the fish while pushing the boat. Pike, or yellow bass as they are termed in Bradford county, are very numerous in the Susquehanna.

The following day we sailed for Wyalusing, where we ended our journey and stayed for a few days enjoying ourselves to the fullest extent. The hotel there has the best of accommodations, and boats and fishing tackle in abundance. For three miles above and below this place one can catch all the black bass he desires. From thirty to fifty a day is an average catch, with flies in June, and bait in July, August and September.

There are numerous small trout streams near Wyalusing, and one can enjoy this kind of sport if he chooses to do so after a surfeit of bass fishing.

The helgramite, clipper or dobson, a name given to a little black, many-legged worm that is found in the river under stones, is one of the killing baits used there. The best and surest, however, is the little minnow bullhead, also found under the stones in the bed of the stream. Boys keep these baits constantly on hand near the hotel. One visit to this locality will be sure to make a convert of you.

I have done. If your readers take as much pleasure and profit reading this tale as I have in writing it, and dwelling upon the by-gones, some little good will have come to us through the element of our natures, begetting a love for the pastime upon the stream, and beside the rippling brook.

M. M. Brown, M.D.

Ithaca, N. Y., Feb. 26.

TROUTING ON THE BIGOSH.

A DIGRESSION.

OWING to the temporary absence of the writer of these articles, and the fact that he had not revised more of his manuscript, we publish a few extracts from letters received, which show a variety of opinions on the different subjects treated of in the papers.

A writer from Ohio says: "It is neither right nor fair to write of such good fishing grounds and not give their location. After getting interested in the narrative, I wanted to find out where the 'Bigosh' was situated, but, on looking back to the first chapter, I find that this point is carefully concealed. I protest that this is not fair." [We advise our friend to wait, perhaps the secret may be told at some future time].

Another Ohio man writes: "I know where the 'Bigosh' is, and have fished it long before Mr. Mather ever saw it. It is a good-sized stream and mill pond, about twenty-five miles north of Port Colborne, on the north shore of Lake Ontario. I met Mr. M. near there in 1870, as he was returning from a fishing trip. He has exaggerated the size of the trout found there, for I never took one above a pound weight." [Wrong, guess again].

Mr. N. R. Pierce is of the opinion that the river "is either Thunder Bay River or one of the streams flowing into Cheboygan Lake in Michigan. The size of the trout is overstated, but all indications point to this. 'Uncle Ben' is a nom de plume to hide a well-known settler, who is now a guide, whose favorite expletive has been used to conceal the identity of the locality." [Also wrong, the fishing there is not as good as is represented on the "Bigosh," the narrative of adventures upon which has been called by the writer of them a "truttaceous history"].

Mr. R. B. Marston, of the London *Fishing Gazette*, says: "I have been much interested and amused at the 'Trouting on the Bigosh' and the adventures and mishaps of 'Uncle Ben.' The catching of that 'anker' was, indeed, a surprise."

Mr. A. N. Cheney remarks: "I hope the story will be continued; it is a most excellent plan for combining instruction and amusement, and many will profit by it who would find plain directions very dry. The 'Bigosh' papers deserve to be gathered into a book when finished, and I hope they will be so published."

Dr. J. A. Henshall in a private letter to the writer of the articles in question says: "I wish to thank you personally for your 'Bigosh papers,' which have pleased me very much. They are *multum in parvo*, and will impart much valuable information in a very pleasant way, to anglers generally and to the novice particularly."

"A Subscriber" writes: "If a man is going to write about good fishing why does he not tell where the place is? I want to go to a good place next summer, and I want to find one that is not overrun with tourists and anglers. It is very exasperating to read of such places and not know where they are. I would prefer not to read of them, for I don't care a cent about the good times they had nor how they fished, how a fly should be cast or a stream waded. What I want is to know where to go and if the 'Bigosh papers' does not tell then I will soon lose interest in them. If the writer of them declines to inform us where these happy fishing grounds lie, then it is the duty of Forest and Stream to do so." ["Subscriber" will have to wait the pleasure of the author of the papers. Forest and Stream has not asked his secret and does not possess it. We have heard him say that some day in the near future he would give this information to the public, but how long or short a time may elapse before he does it we cannot say.]

"Von W." writes: "I have a point of difference to make with my old friend Mather, who I do not think does Frank Forester fair justice in regard to his distinction between the pike and muscalonge. I have not "Fish and Fishing" by me now, for I lent it some half dozen years since, and it has never come back again, but I remember very clearly the difference between the two heads in the book. The pike toothed to the extreme point of the jaw, and the muscalonge with his great tusk about half way to the front, and a long bony projection forming the extremity of the jaw, together with the entirely reversed markings of the two fish, the muscalonge having dark reticulations on an olive ground; the pike light oblong blotches, and think that Frank Forester noted and understood these differences, although he was all at sea on the varieties of the genus *Salmo*, and that is not much to be wondered at, as the researches of thirty years, since Herbert's day, have not defined them clearly as yet. Although *Salmo namaycush, amethystus, confinis, tonia*, etc., etc., are generally now relegated to one species, while Prof. Jordan is gradually crystallizing the various species of the Rocky Mountain region and Pacific Slope."

A DOMESTIC TROUT POND.

I AM often asked by acquaintances, who are fond of trout and trout fishing, whether, under given circumstances, an artificially made pond will pay in either a sporting or pecuniary sense; and how such can best be constructed with a due regard to economy and success? Not being an ichthyologist, nor at all skilled in pisciculture, I always answer such questions by simply relating my own experience in this matter; leaving the inquirer to make the application to his particular case as best he may. The subject is one of such great and general interest, and of so much real economic importance, that I am sure many hundreds of your readers will be glad to hear a short and plain account of my experiment, and its results. I will enter into details no further than is necessary to make myself understood, and to enable the reader to judge how far my mode of procedure may be applicable to his own locality and circumstances.

On a certain part of a large farm, which I once owned and occupied, there was, and is, a beautiful and never failing spring, which, issuing from the base of a high range of hills, discharges its waters after a course of a few hundred yards, through a gravelly clay soil, into an adjacent trout brook, of which it is one of the numerous feeders. At the time I write of, there was never any perceptible difference between the winter and summer flow of this spring. Its trickling stream always furnished, I should think, about two hundred gallons per hour of the purest and most delicious water; which was of almost icy coldness on first emerging from its mysterious birthplace—the dark recesses of the hills. The ground which lay between the spring and the creek presented a gentle slope, being about five feet lower at the bank's edge of the latter than it was at the spring's outlet, the distance between the two being less than a quarter of a mile. The bank which overlooked the brook, was here about thirty feet high, but had been cut into a deep and jagged gully or ravine, by the overflow from the spring, which at first probably had marked out a course, but at length, aided through successive ages by the drainage from the contiguous uplands, had widened and deepened the ravine until the bottom at its mouth was on a level with the bed of the creek; while close to the spring it was not much larger than a ploughed furrow.

Of course, as through process of time and constant erosion of the running water this ravine had gradually become deeper, clay and gravel from its sides would fall into the abyss; the soluble parts being washed away, while the boulders and small stones remained in its bed. Thus, by the time it had reached hard pan it was some sixty feet wide at the surface of its lower part and thirty feet deep, and thence tapered off to almost nothing at its highest part near the spring.

One day a friend from England, who was an enthusiastic angler, had been fishing with me in the creek. The trout were becoming rather scarce, and those still remaining were of small size. Consequently our luck had not been very great, but we had taken a few tolerably good fish at the mouth of the ravine, which was their favorite resort, owing to the discharge of cold water from the spring. Upon seeing this great gully my friend said: "Why in the world do you not make a trout pond here? The work is already done to your hand. All you have to do more is to build a dam." Some further conversation followed, during which my visitor gave me some facts and figures as to the productiveness and consequent value of a properly managed pond of this kind. The upshot was that I determined to try the experiment. It was now the beginning of June, our spring seeding was all done, and we could devote a few days to this work without damage to other interests. I will briefly state exactly what we did, how we did it, its estimated cost, and the result in the way of returns for time and labor expended. It must be borne in mind that the gulch which was to become the channel of our proposed pond was already excavated in the form of the letter V, being quite wide at the surface of the ground, and almost sharp at the bottom, its width and depth, of course, increasing from the upper to the lower end.

We commenced our dam by procuring fifteen strong cedar posts varying in length from six to thirty-four feet. These were charred at one end and firmly set in a row across the mouth of the ravine, at distances of four feet apart and to about the same depth in the ground. As each post was planted, it was thoroughly puddled around with stiff clay, and the three center ones were strengthened by long transverse braces notched into their tops and also into a hard bed of concrete on the lower side of the dam, where they were further secured by large boulders. Then we split a number of cedar logs into rough four-inch slabs, and spiked them to the up-stream face of the posts, the ends of the slabs being let into the clay banks on either side, and well puddled. Now we took the green brush of the cedar tops and two or three loads of spruce and hemlock spray, and arranged all carefully at the bottom of the gully against our wall of slabs. Then, with a pair of horses, a plough and a common road scraper, we turned up and drew in the heavy earth from the heights on each side, ramming it down firmly as we went along, until we had made a sloping embankment of perhaps fifty feet wide at the bottom of the ravine and ten feet at the top. This we covered over from end to end with coarse gravel and upon this a layer of as large boulders as we could handle; except just in the center, where we arranged a rude grated sluiceway which would allow the passage of superfluous water and yet prevent the escape of fish. Our dam was now finished and was evidently water-tight, as quite a little pond had already formed at its base although we had only been two days engaged in its construction.

Next, with a view of providing shade, shelter and hiding places for our trout, we placed eight very large cedar logs, at distances of twenty feet apart, across the ravine, and two feet from its bottom. The ends of these logs were let into the banks and weighted by boulders. At about one-third of the distance from the spring to the dam, where we judged the water would be when the pond was full, two or three feet deep, we stretched a screen of common fanning-mill wire netting, with half-inch meshes. This was to furnish a safe retreat for the small fry when pressed by their cannibalistic relatives, and most admirably it answered its purpose. In twelve days from the time the dam was finished the reser-

Rod vs. Hand Line.—Last summer Mr. Charles F. Pan coast, of Germantown, trolled for bluefish with a twelve-ounce rod and succeeded in killing several weighing as high as ten pounds each, and many of smaller size. Mr. P. represents the sport as being very fine and a decided improvement over the common method of taking bluefish with a hand line, a style of fishing which requires no dexterity.

voir was full to the brim, and a small stream trickled out through the waste weir. We then planted along the edge of the water, on each bank, at intervals of ten feet, a number of stubby pieces of the branches of the common yellow willow, entirely denuded of twigs and leaves. Late as it was in the season, all of these cuttings took root and grew. We now had a pond, of triangular shape, about four hundred yards long, twenty yards wide and nearly thirty feet deep at the dam, from whence it tapered off to nothing toward the spring. The superficial area of its surface would be something over three-fourths of an acre. The great desideratum was to stock it with trout. This we did in half a day by stretching a small-meshed net across the creek and driving the stream until we had obtained about two hundred and fifty troutlings, averaging five inches in length. These were turned, after every haul, directly out of the net into the pond, and all lived and throve. In the following September we put in two hundred more.

Now for cost and results. We need not put any price upon the site, as it was waste land; in fact, we may enter something to the credit side of account on this score, as this considerable body of water in the newly-formed pond greatly improved the surrounding pasturage to a distance of many yards on either margin. The total cost to me was very trifling, as I had the team and men and all the material at hand, except spikes and wire netting. But assuming that I had been obliged to hire and purchase everything for the occasion, the debit account would stand about thus:

One pair of horses and two men, 3 days	$15 00
Cedar for posts and slabs, say	10 00
Spikes, nails and wire netting, say	5 00
Total	$30 00

To this we may add a supposed sum of five dollars for netting minnows all through the first two summers (none were required after that) to supply the trout with food, and we have a grand total of $35. Not a fish was taken from the pond—except to be looked at and returned—for four years, by which time the willows on the banks had grown to thrifty trees, and every alternate one was then removed. Those remaining not only furnished a grateful shade, but their pendant branches yielded a constant summer supply of fish food in the shape of falling caterpillars and other larvæ and insects. During these four years we could see that the trout were increasing rapidly in size and numbers, and that the progeny of the sucker, chub and shiner minnows first put in were also plentiful enough to supply the choice fish with a square meal when desired. The fifth summer I took from this preserve with a barbless hook one hundred and sixty-three pounds of trout, returning to the water all individuals which I thought to be under eight ounces in weight. Reckon this one season's catch at even twenty-five cents per pound, and you will see that I was already recouped for my whole expenditure. In each of the sixth, seventh and eighth summers I took about two hundred pounds of beautiful fish, some specimens now weighing over two pounds. Then I sold the farm, getting at least $500 more for it than I would have done if minus the pond. Any schoolboy can answer the question as to whether my experiment paid.

It is now, or will be next June, just twenty-nine years since this pond was made. I have not seen it for twenty-one years, but was told, eighteen months ago, that the dam was then perfectly sound and tight; the fish thrifty and plentiful, and yielding to the owner of the farm a greater yearly net profit than any five acres of his best land. Now, it is true that every farmer has not upon his property a hillside spring, nor a site for a trout pond already excavated; but a great many have both of those requisites, and a still larger number have the spring. If the water of this is of a quality suitable for trout it will always pay its fortunate possessor to make a pond for the culture of these valuable fish, even if he has to scoop it out of a level piece of ground on the most fertile portion of his estate. From no crop whatever, on the same limited area, can so large an amount of pleasure, profit and amusement be derived, always supposing that the enterprise is conducted with a correct idea of the nature of the fish and a due regard for their requirements. My pond, the reader will observe, furnished near its upper part a perfect spawning and breeding ground. W. T.

East Saginaw, February, 1884.

Showing the Boys How To Do It.—Grand Rapids, Mich.—The three boats of the "Hill Spoon Gang" returned to camp at noon and reported a "water haul," when up spoke C., who had remained in camp: "Oh, you fellows are no good; you don't know how to catch fish. Your best hold is to blow about what you have done or are a-going to do, while, with the best kind of fishing ground all around us, we are obliged to eat salt pork or go hungry, all on account of a set of ne'er do wells. But there is going to be a radical change in the fashion—a civil reform. I'll go with you this afternoon and just show you how to do it. It's time you chaps had some instruction; so come along after dinner and you shall have it free gratis for nothing." That afternoon all hands were out, and the three boats kept well together, in order that we might derive as much benefit as possible from our self-constituted instructor. There was some haste, a little confusion and considerable chaffing during the three minutes' time spent in getting to the spot, and all were more or less excited in consequence. C. had laid violent hands on the first rod which came in his way that was rigged up, scrambled into the boat, hurriedly untied the snell which was on the line, drew from his pocket a fine, long leader, tied to this a new snell, and about eighteen inches up on the leader fastened a large brown hackle, and again above this another fly of the most gorgeous character. Then selecting and hooking a fine, large minnow, with a sort of a superior "you'll see, I know" kind of a look, grasped his rod with one hand, leader with the other, and made a two-handed cast. The bait touched the water about six feet from the boat, and as the minnow slowly settled and leisurely wiggled away, dragging after him two snells, two flies and a brand new leader, it was plainly to be seen that C. had, in his hurry and confusion, tied his leader to the old snell instead of his line! There was a snort, a wild yell, some considerable language used more emphatic than polite, as the occupants of the boat with one accord arose and announced to the balance of the gang the result of their first lesson of "how to catch 'em." There were no fish caught that afternoon, as the jeering, screaming and laughing sent them miles away. It will be some time before C. hears the last of the first lesson he gave us, notwithstanding he has been liberal in doing penance in the way of cigars and other fixings.—W.

A Happy Day.—Sullivan county, New York, is dotted here and there with beautiful sheets of water; one of these, situated on one of the peaks of the Shawangunk range, my companion and I selected for a day's fishing. Pickerel was our game to-day, but we were not above the catfish and perch which also inhabit these waters. The morning, however, was not favorable for pickerel, as the wind was high, and not a cloud was to be seen. The perch bit rapidly, though, and we soon had a fine string of these, and also a few catfish. In the afternoon, much to our satisfaction, the wind began to moderate, and sunset (which time, in my estimation, is as good as any for pickerel) found us on our favorite grounds, ready for business. My line, touching water first, was immediately seized by a fine one, which, after a noble fight, proved to be "two-pounder." My companion, not to be outdone, fastened to one that threatened to end his sport by carrying everything away; but being an adept in the art, he soon had the fish under control, and after a well-fought battle of some minutes, succeeded in landing him, amid great objections on the part of the fish. About this time we were visited by a shower of white millers, a phenomenon that I have never witnessed since or before. The pickerel now began to jump in rapid succession all around us after these insects, and we discovered then, to our sorrow, that we had left our spoons at home. After the millers left us the pickerel refused to bite, and as it was getting late, we prepared to go home. Our day's catch summed up as follows: Fifteen pounds of perch, three catfish and eight pickerel, the largest, whose capture I described, weighing four pounds; total weight of pickerel, sixteen pounds. After a weary walk home and a hearty meal of pickerel, we retired to bed to live the day over in our dreams.—Sullivan.

Muddy Flavor in Fish.—Fillmore County, Minn.—In the valentine number of Forest and Stream, Capt. M. P. Peirce writes of the edible qualities of carp, illustrating it by Jersey chickens raised on offal and then fed on pure food and clean water in a short time being fit for the table. I believe the same method workable with fish. The creeks in this part of Minnesota three years ago were teeming with brook trout in June, July and August, and I seldom, in a day's fishing, failed to creel twenty-five pounds of average half-pounders. Now I am satisfied with half a dozen of the same average weight, and have put in a full day, wind and weather favorable, summing up three trout, weighing one and one-quarter pounds. Why the change? Reasons various. The first great cause was "breaking up" all land that could be tilled for wheat, the wash from plowing filled our streams with mud, and no suitable places being left for spawning. I now come to the point I started out to make—a long way around, but a fisherman has to detour at times to make a cast—table quality of fish in turbid versus clear water. Trout caught in our streams when muddy lose all their flavor, while in five to eight days after the water becomes clear, they are as fine flavored as before the flood. Last summer, from the middle of May to the last of June, with spoon I caught from one to five black bass nearly every day. When the water was muddy the fish were contaminated, when clear they were free from any taint of mud. Our grangers the past five years have paid more attention to stock raising, "seeded down" the valleys, hence the wash is small; plants are again growing in the running brooks, affording cover for trout, and we hope to obtain fry from the State to restock our streams the coming summer.—J. M. C.

Tennessee.—Dyersburg, Tenn., Feb. 27.—A few ruffed grouse have been seen, and one was killed by Guy Douglass in the Obion hills, near this place, last week. As I have never seen nor heard of one before in West Tennessee, we are anxious to know where they came from. I will give you a slight description, and ask if it has been correctly named. In color, nearly same as quail or woodcock, with ruffle around neck and crest on back of head, like the bluejay; also dark circle in tail, and in size nearly as large as a guinea hen. It was sitting on a log at time it was killed. Everybody in vicinity has been cautioned not to shoot or disturb the rest of flock, and they all express an anxiety to protect them and encourage them to remain, as there is no better place on earth than the hills that lie on Obion River for them to rear their young. Live quail have been offered here freely at one dollar per dozen, others at seventy-five cents per dozen. A few woodcock are occasionally brought in. John Tarrant was returning home a few days ago, with game bag well filled with quail, and met a negro with a lot of woodcock he had just killed. The negro proposed to swap "dem four brown snipe" for four quail, which was accepted and presented to the writer.—T. L. W.

Growth of Rainbow Trout.—Waterville, N. Y.—Two years ago about ten thousand California mountain trout were put into a pond in this village. The next spring we found that the growth of these trout, compared to that of our native trout, was astounding. The following August one weighing three-quarters of a pound was caught by a small boy. I would never have believed that their growth was so rapid had I not seen the fish weighed. The trout at the time this large one was caught were a little over a year old. Now, many of our fishermen are wild on the subject of California trout, and we shall put twenty thousand more into the same pond again this summer. But for one I do not think that they compare with our own brook trout in gaminess, flavor or beauty. But our experiment was a decided success. For the past three or four years we have been stocking our streams with brook trout, and find the fishing very much improved thereby. Unless something unforeseen occurs we shall continue to stock them every year.—N.

What is Done with Small Lobsters.—Newport, R. I., Feb. 29.—The Fish Commission of Massachusetts is trying to stop the sale of small lobsters in market by having the law amended so as to increase the length at which they can be sold. I would ask them if they think that all under the legal size are put back. If they think so they are mistaken; they are put into cars and kept alive for bait for the tautog fishermen, when they are "exposed" for sale at prices ranging from fifty cents to one dollar per bushel. In this case the lobster catcher has broken the law by offering them for sale, and the tautog fisher has violated it by having them in his possession, even though he throws them into the water after putting them on his hook. True, he is obeying the letter of the law in "returning them to the water," but does he not violate its spirit? Yet our lobster men complain that there are few large lobsters.—Clams and Crabs.

Illustrated Catalogue of Fishing Tackle.—We have received a finely illustrated catalogue and price list of fine fishing tackle, manufactured by Messrs. Abbey & Imbrie. The large, handsome plates give a good idea of the varied articles which go to make up an angler's outfit, and the side-bends of the hooks are well shown by shadows. There are 92 full-page folio plates and over twenty pages of text, in which all that the angler requires, except boats and provisions, are catalogued. These articles are so numerous that the list is surprising, even to one familiar with such matters. The great merit of this catalogue is its accuracy. The different articles figured in it are drawn of the exact size of nature, and by referring to the price list, the intending purchaser will learn all those particulars about the article he is interested in which cannot be told in an engraving. The price of the catalogue is fifty cents.

Anglers' Association of the St. Lawrence.—Utica, Feb. 27.—*Editor Forest and Stream:* A special meeting of the Anglers' Association of the St Lawrence River will be held in the parlors of the Butterfield House, Utica, on the afternoon and evening of March 11, commencing at 3 P. M. Matters of great importance regarding the work of the association during the coming spring and summer will be discussed, and arrangements will be made for a strict enforcement of the laws governing fishing in the St. Lawrence River. In addition to the business of the association to come before the meeting, it is hoped that papers of interest in relation to the favorite fish of the St. Lawrence will be read and discussed. It will be a favor if all members who intend to be present will give notice to the secretary by card as early as convenient.—Chas. H. Ballou, Recording Secretary.

Fishculture.

MORE GERMAN TROUT EGGS.—The steamer Donau, of the North German Lloyds, recently brought 70,000 eggs of *Salmo fario* to this country. Forty thousand of these were consigned to Mr. Fred Mather for the U. S. F. C., and 30,000 to Mr. E. G. Blackford on account of New York. The eggs were of two kinds, large and small, and were sent to Cold Spring Harbor for distribution. They have been divided between Northville, Mich.; Central Station, Washington; Wytheville, Va.; Caledonia, N. Y., and Cold Spring Harbor. They came from the ponds of Mr. C. Schuster, Freiburg, Baden, and were in good order. The North German Lloyds made no charge for transportation.

EGGS SHIPPED ABROAD.—On Saturday last Mr. James Annin, Jr., of Caledonia, N. Y., sent 10,000 eggs of brook trout by steamer Iceland, directed to Herrn Fiskeri Inspektor Landmark, Kristiani, Norway. On the 8th the New York Fish Commission will send 30,000 eggs of the rainbow trout to the Deutschen Fischerei Verein, Berlin, by the steamer Main. These shipments are made by Mr. E. G. Blackford, New York. Professor Baird has sent to Germany 1,000,000 whitefish eggs, 25,000 brook trout and 25,000 lake trout, and on the 8th will send 5,000 land-locked salmon to Sir James G. Maitland, Scotland.

ENGLISH TROUT IN AMERICA.—The steamer Adriatic, of the White Star Line, brought 10,000 eggs of the *Salmo fario* as a present to the Cold Spring Harbor Station of the New York Fish Commission, presented by the *Fishing Gazette*, of London. They were in three lots, 5,000 marked "best trout," 3,000 from the Itchin and 2,000 from the Wey districts. They came in excellent order, and were carried free of charge by Messrs. Ismay, Imrie & Co., the London agents of the line.

THE CONNECTICUT COMMISSION.—The Governor of Connecticut has appointed Mr. James A. Bill, of Lyme, to be a Commissioner of Fisheries for three years from August next, in place of Mr. G. N. Woodruff, whose term expires at that time. Mr. Bill has served with credit in that capacity in former years. The Senate has confirmed his appointment.

New Publications.

Hints on Camping. Mr. Howard Henderson's "Practical Hints on Camping" contains a considerable amount of information, and will no doubt be useful to those who are contemplating their first camping trip. And yet the author gives a deal of instruction which is wholly opposed to what many years of camp life have taught us. His list of articles required for a trip covers three octavo pages in small type, and unless the camper is supposed to be traveling with a fleet of boats or a good-sized wagon train, we are at a loss to know just how all this material is to be transported. We have always found that the less one carries with him into camp the more easily he can get along, and we believe that nothing so contributes to the annoyance and delay of the outdoor traveler as his burdening himself with a great variety of articles that might just as well be left at home. It is wiser to travel light, and the more one lives in camp the lighter will be his outfit. On the other hand, if one is near a railroad or a steamboat landing, there is no reason why he should not have almost everything that he would if he were at home in his own house. It is a fact, however, that it is almost impossible for any one to give instructions which will serve the tyro in his first efforts to live comfortably out of doors. The only teacher is experience, but Mr. Henderson's little book will be a help to some of this class. Some of his recipes for camp cookery are excellent, as are many of the directions in the chapter on accidents and ailments. We give a list of the chapters: I. Preparation; II. Outfit; III. Shelter; IV. General Directions; V. Knots and Ties; VI. Camp Cooking; VII. Rod and Line: VIII. How to Make a Fish Net and Hammock; IX. The Horsehair Fish Line, X. The Gun; XI. Boats and Boating; XII. Night Spearing; XIII. Accidents and Ailments; XIV. Camp Photography. (Jansen, McClurg & Co., Chicago, Ill.).

Florida and the Game Water Birds.—In the year 1882 Messrs. Robert B. Roosevelt and Seth Green went to Florida in Mr. Roosevelt's yacht, the Heartsease. The trip has been made famous by a widely distributed patent medicine advertisement, in which, under his portrait and over his signature, Mr. Green deposes that in Florida he contracted malaria. At this statement the souls of loyal Floridians are greatly vexed with indignation. Another and pleasanter fruit of the Heartsease expedition is a book by Mr. Roosevelt, in which he details the Florida experience of himself and companions. If Floridians resent Mr. Green's malaria inuendoes, they have abundant reason to be pleased with the book. Mr. Roosevelt always writes in a delightful vein when the theme is field or water sport. In the present volume the author displays his usual felicity of style, and writes with enthusiasm. The log of the yacht is given in detail, and the directions will be found invaluable to those who follow the course of the Heartsease from New York to Florida, via the inside passage. Mr. Roosevelt is loud in his praises of Florida as a winter cruising ground. To the account of the Florida trip has been added a revision of a former book on the game water birds of the Atlantic coast and the lakes, and those who have long sought in vain for a copy of the first edition will welcome this reprint. In the several chapters Mr. Roosevelt has stored up a rich fund of gunner's wisdom, and we can heartily commend the work to the novice, who will find here more than he will probably ever learn by experience. The book, otherwise well printed, is disfigured by numerous aged and second-hand cuts, the credit for inserting which, we presume, belongs to the publishers. (Orange Judd Co.).

Corpulence and Its Treatment is a small pamphlet, translated by Emil W. Haeber, M. D., from the German of Dr. William Ebestein. (Brentano Bros., New York).

Failing Powers in Middle Age are best provided against by an endowment policy in the Travelers, of Hartford, Conn. At age 30, an endowment for $1,000 maturing at 50 costs but $39.70 a year.

FIXTURES.

BENCH SHOWS.

March 4, 5, 6 and 7.—Cincinnati Bench Show, Melodian Hall. Entries close Feb. 25. Charles Lincoln, Superintendent, care of B. Kittredge & Co., Cincinnati, Ohio.

March 12, 13 and 14.—New Haven Kennel Club's First Annual Bench Show, Second Regiment Armory. Edward S. Porter, Secretary, Box 667 New Haven, Conn. Entries close March 1.

March 18 to 21.—Washington Bench Show, Masonic Hall, Washington, D. C. Chas. Lincoln, Superintendent.

March 26, 27 and 28.—The Dominion Kennel Club's Second Annual Bench Show, Horticultural Gardens. Charles Lincoln, Superintendent. C. Greville Harston, Secretary, Toronto, Canada.

April 3, 4 and 5.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 3832, New York. Number of entries already printed **1010.** Volume I., bound in cloth, sent postpaid, $1.50.

WASHINGTON DOG SHOW.

FOLLOWING is the premium list for the bench show to be held at Washington, commencing March 18:

Champion mastiffs, dogs, champion medal, bitches the same, open, dogs, $10 and $5, bitches the same. Rough-coated St. Bernards and smooth-coated St. Bernards, same as mastiffs. Newfoundlands, $10 and silver medal. Champion greyhound, dogs, champion medal, bitches the same; open, dogs, $10 and silver medal, bitches the same; puppies, silver medal. Champion deerhounds, champion medal; open, $10 and silver medal. Champion pointers, dogs and bitches over 55lbs., $15; open, dogs, $15 and $5; bitches over 50lbs., the same. Champion pointers, dogs and bitches under 55lbs., $15; open, dogs, $15 and $5; bitches under 50lbs., the same; puppies $7 and $3. Champion English setters, dogs, $15; bitches, the same; open, dogs, $15 and $5; bitches, the same; puppies, dogs, $7 and $3; bitches, the same. Champion black and tan setters, dog or bitch, $15; open, dogs, $15 and $5; bitches, the same; puppies, $7 and $3. Champion Irish setters, dogs, $15; bitches, the same; open, dogs, $15 and $5; bitches, the same; puppies, $7 and $3. Chesapeake Bay dogs, $10 and silver medal. Champion Irish water spaniels, champion medal; open, $10 and silver medal. Champion field spaniels, any color, over 28lbs., champion medal; open, $10 and $5. Champion cocker spaniels (any color) under 28lbs., champion medal; open, $10 and $5. Champion foxhounds, champion medal; open, $10 and $5. Champion beagles, champion medal; open, dogs $10 and $5, bitches the same. Dachshunde, $10 and silver medal. Champion fox-terriers, champion medal; open, dogs $10 and $5, bitches the same; puppies silver medal. Champion collie dogs, champion medal, bitches the same; open, dogs $10 and $5, bitches the same; puppies silver medal. Champion bulldogs, champion medal, bitches the same; open, dogs $10 and $5, bitches the same. Champion bull-terriers, champion medal; open, $10 and $5. Rough-haired terriers $10 and silver medal; black and tan terriers, over 7lbs., $10 and silver medal; Dandy Dinmonts, $10 and silver medal; Irish terriers, $10 and silver medal. Champion Skye terriers, champion medal; open, $10 and $5. Champion pug dogs, champion medal, bitches the same; open, dogs $10 and $5, bitches the same; puppies silver medal. Champion Yorkshire terriers, champion medal; open, $10 and $5. Toy terriers under 7lbs., $10 and silver medal. King Charles spaniels, $10 and silver medal. Blenheim spaniels, $10 and silver medal. Japanese spaniels, $10 and silver medal. Italian greyhounds, $10 and silver medal. Miscellaneous, three prizes $5 each.

NEW YORK DOG SHOW.

WE have received the premium list of the eighth annual bench show of the Westminster Kennel Club, to be held at Madison Square Garden, May 6, 7, 8 and 9. The list is the same as that of last year, except that a class is made for Basset hounds, champion and open classes for bull bitches, a class for Bedlington terriers, and a dog and bitch class for poodles, making 120 classes in all, as against 114 last year. The premiums are as follows: Champion mastiffs, dogs, champion medal, bitches the same; open, dogs $10, $5 and silver medal, bitches the same; puppies $5 and silver medal. Rough-coated St. Bernards the same as mastiff class, except that puppies get $10 and silver medal. Smooth-coated St. Bernards the same. Berghunde dogs $10 and silver medal, bitches the same. Newfoundlands, dogs or bitches $10 and silver medal. Champion greyhounds, dogs champion medal, bitches the same; open, dogs $10 and silver medal, bitches the same; puppies, dogs or bitches, the same. Champion deerhounds, dogs or bitches, champion medal; open, dogs $10 and silver medal, bitches the same. Champion pointers (over 55lbs.) dogs $25, bitches (over 50lbs.) the same; open, dogs $20, $10 and silver medal, bitches the same, small pointer class the same; puppies, dogs over 12 and under 18 months $10 and silver medal, bitches the same; under 12 months, dogs or bitches the same. Champion English setter dogs $25, bitches the same; open, dogs $20, $10 and silver medal, bitches the same; puppies, dogs over 12 and under 18 months $10 and silver medal, bitches the same; under 12 months; dogs or bitches, the same. Champion black and tan setter dogs $25, bitches the same; open, dogs $20, $10 and silver medal, bitches the same; puppies, dogs $10 and silver medal, bitches the same; Irish setters the same as the black and tan setters. Chesapeake Bay dogs, dogs or bitches, $10 and silver medal. Champion Irish water spaniels, dogs or bitches, champion medal; open, $10 and silver medal. Champion field spaniels (any color) over 28lbs., dogs or bitches, champion medal; open, $10 and $5. Champion cocker spaniels (any color) under 28lbs., dogs or bitches, champion medal; open (liver and black) $10 and $5, any color other than liver or black the same; puppies, field or cocker, (any color) $5 and silver medal. Champion foxhounds, dogs or bitches, champion medal; open, $10, $5 and silver medal. Champion beagles, dogs or bitches, champion medal; open, dogs, $10, $5 and silver medal, bitches the same; puppies, dogs or bitches, silver medal. Basset hounds, dogs or bitches, $10 and silver medal. Dachshunde, dogs or bitches, $10 and silver medal. Champion fox-terriers, dogs, champion medal; bitches the same; open, dogs, $10, $5 and silver medal, bitches the same; puppies, dogs, silver medal, bitches the same. Wire-haired fox-terriers, dogs or bitches, $10 and $5. Champion collies, dogs, champion medal, bitches the same; open, dogs, $10, $5 and silver medal, bitches the same; puppies, dogs, silver medal, bitches the same. Champion bulls, dogs, champion medal, bitches (if of sufficient merit) the same; open, dogs, $10, $5 and silver medal, bitches the same. Champion bull-terriers over 25lbs., dogs or bitches, champion medal; open, $10, $5 and silver medal; class under 25lbs. the same; puppies, silver medal. Black and tan terriers over 7lbs., dogs or bitches, $10 and silver medal; rough-haired terriers the same; Dandie Dinmont terriers the same: Irish terriers the same; Bedlington terriers the same. Champion Skye terriers, dogs or bitches, champion medal; open, $10, $5 and silver medal. Champion pugs, dogs, champion medal, bitches the same; open, dogs, $10, $5 and silver medal, bitches the same; puppies, silver medal. Champion Yorkshire terriers over 5lbs., dogs or bitches, champion medal; open, $10, $5 and silver medal; class under 5lbs. the same. Toy terriers other than Yorkshire under 7lbs., $10 and silver medal; King Charles spaniels the same; Blenheim spaniels the same; Japanese spaniels the same; Italian greyhounds the same. Poodles, dogs, the same, bitches the same. Miscellaneous class over 25lbs., $10, $5 and silver medal; class under 25lbs. the same. In addition to the above list it is expected that a large number of valuable specials will be offered. Entries close April 23.

Editor Forest and Stream:

The managers of the bench show have decided to give a champion medal for the best bull bitch in Class 87, provided there is a bitch worthy of it in the opinion of the judges.

CHAS. LINCOLN, Supt.

NEW YORK, March 3, 1884.

IMPORTATION OF BEAGLES.

Editor Forest and Stream:

The steamship Pennsylvania, which arrived at this port Feb. 27, brought three beagles consigned to Wm. H. Ashburner of this city, president of the beagle club.

As this importation is of direct interest to the breeders of beagles, giving opportunity of fresh crosses with some of the most approved of the British strains, it is proper to give the following description of them:

Minstrel, a black, white and tan dog hound, from a noted pack in Cornwall, a second season dog and two years old, of nice style and quality, good eyes, ears well carried and of good length, excellent body, legs and feet, altogether a desirable hound. This dog was selected by Louis Clement ("Wildfowler"), the well-known correspondent of the London *Field*, and formerly its kennel editor, now publisher and proprietor of the *Kennel News*, London, England.

"Wildfowler" was at particular trouble and care in procuring this beagle, and speaks in high terms of his blood and breeding.

Owing to delay in the mails, the extended pedigree has not been yet received from abroad.

Foreman, tan, lemon and white dog, four years old, ten inches at shoulder, has a well domed skull, broad across the top, excellent ears, eyes of true beagle character, good coat of proper texture, body cobby and compact, a grand little dog, and of the accepted type. Bred by Mr. J. Crane, Surry, England.

PEDIGREE OF ENGLISH BEAGLE DOG FOREMAN.

Foreman.

Bravo.	Honesty.
Fashion. Butterfly.	Hymen. Moorhen.

Hymen, by Pilgrim (Pealer—Dewdrop) out of Harmony. Dewdrop, by Damper out of Precious.

Deborah, black, white and tan bitch, two years old, height ten (10) inches at the shoulder. This is a remarkably fine beagle; indeed, it is a question if her superior can be found in this country. In many of the points that go to make up the first-class hound she cannot be excelled. In head, eyes, ears, muzzle, jaw and lips she is wonderfully fine, while her legs and feet are of the best, and her general appearance very attractive.

PEDIGREE OF ENGLISH BEAGLE BITCH DEBORAH.

Deborah.

Miraculous.		Rachel.	
Mushroom.	Pleasant.	Pealer.	Dewdrop.
Pilgrim.	Harmony. Damper.	Precious.	Damper. Precious.

The bitch Deborah is an inbred Damper, sire of Mr. Crane's famous 10-inch dog Giant, that is claimed to be the best beagle in England. Precious, to whom she is also closely inbred, won first and cup at Crystal Palace, London, and first and cup at Portsmouth, the only times shown.

Foreman and Deborah were bred by Mr. J. Crane, of Southover House, Surrey, England. The Crane strain of beagles are admitted to be the best in England. Stonehenge, in "Dogs of the British Islands," makes special mention of them, and selected Giant and Ringlet, two of Mr. Crane's breeding, to illustrate his article on the beagle.

Foreman and Deborah were purchased of E. Carew-Gibson, Esq., of Sussex, England.

Mr. Ashburner's importation experienced a very rough passage out, but arrived in good condition. RUSTICUS.

PHILADELPHIA, Feb. 29.

BEAGLES AND WILDCATS.

Editor Forest and Stream:

My friend C. and I had agreed to have a chase as soon as the weather cleared. Jan. 18 opened as dark and dreary as some preceding days, but toward noon the clouds disappeared and the evening was calm, bright and pleasant. It was just the evening almost any one, be he sportsman or other, could enjoy in the open air after having been housed for a week. So, early in the afternoon, my son (who, for the occasion, acted as our whipper in) and I, mounted and equipped, were prepared for the promised hunt. Our hounds, it seems, had anticipated the event and had preceded us to the woods and at that moment were running quite lively not more than half a mile away. We were off for them in a twinkling, but before we overtook them the wildcat was up a tree. We had some beagle puppies with us, and, wishing to see how they would perform in a cat chase, we tried to jump the game out by throwing stones and sticks at it, but it did not seem disposed to come down. We drew a Colt's .44, then it tumbled.

On to meet C., whom we soon joined. His three hounds increased our pack, all told, to twelve dogs. This little dog is King Charlie, first at New York in May, 1883; but he gets his prizes at shows. This trim, blueticked and tan bitch is Flora, the dog without a registered pedigree, but whose fame is attested by the bleaching skeletons of her many victims in the hills and vales of Southwest Texas, and this black and tan dog is Cap. The others are promising young hounds on the road to fame.

We make a cast down the creek half a mile, finding nothing, and swing around to the hills on the right. Soon Cap gives tongue, and is quickly joined by the pack. They are getting settled down to their work about night, when a fine old buck shows up in front. Cap, Charlie and some of the others can't resist the temptation, so after the antlers they go, Flora and one other holding steadily to first game. The whip goes after the truants and succeeds in bringing part of them back. C. and I follow the two. They carry their game circling to our left. Their cry, once lost in the distance, is again heard as they come around, as if coming back to the place of starting. The whip having rejoined us, we hasten to meet them, but before we get to them they have overtaken the cat and are holding her at bay in thick live oak runners about as high as our horses. She makes frequent attempts to break and save herself by flight again, but the hounds compel her to turn and fight for life. Once I saw her have poor old Flora down, but the young bloods closed in and compelled her to attend to them. At another time I saw her make directly for C., and I expected she would attempt to mount up with him, but she only passed under his horse. On account of the brush and the fear of killing a dog, it was some time before we could get in a shot, but at last the opportunity came and a shot from C.'s .45 ended the fray.

On again we went, and when we had proceeded but a short distance a fine blue doe passed just in front of us, but as we were not after deer we let her pass without a shot, and succeeded in getting our dogs across the scent without any of them getting off after her. Another half mile Flora challenges to scent, and the young hounds were soon at work. A spirited little chase reminds the old gent that it is best to quit the ground. But we did not have to apply our noses to the tree, as the captain of the 'coon hunters did, for he was in plain view. A crack of my long whip persuaded the old scamp it was time to be going. Down he came and made good his escape to the brush. The dogs, however, after an exciting chase, having several times been thrown over the scent by his doubling on them, brought him to bay, when again the bullet did the work for cat No. 3.

The snort blown, we prepared for home, but Daisy! Where is the little beagle Daisy? The horns ring again and again, but she don't appear. The whip is sent to hunt her, and soon returns with her in his arm, torn or cut and bleeding, and reports that where found the scent of the musk-hog was so rank that he felt uneasy when he dismounted to get the puppy.

Our time was up, and as we were going home the dogs started another cat, but circumstances compelled us to leave some of them in the woods. Lame and tired they came home next day. J. S. H.

RANCH, Bee County, Texas.

BEAGLES FOR FOXES.

Editor Forest and Stream:

Replying to "Bugle," I would say that beagles are not at all suitable for fox hunting, although for fox shooting they are deadly enough.

An average pack of beagles will carry a cold trail with about the same speed and precision as an average pack of foxhounds, while for beating cover late in the day beagles will be at a positive advantage, chiefly from their habits of working through close briers and inspecting knolls and tussocks in swampy places, for the beagle hunts a good deal by sight until the game is a-foot, and foxes love to lie in such places as the hare chooses for her form. But when once the fox is started the beagle's usefulness ends. A red fox will canter away from them, and they cannot force him to give off a good body scent; while even a gray fox will play before them all day long quite cool and self-possessed.

But if the object is to exterminate foxes with the gun, then, most assuredly, the beagle should be the chosen agent, for he will show up the quarry much oftener than foxhounds do.

I may add, that in this section of country foxes are never shot, and no man can think of such a deed without a shudder. True, there is no statute on the subject, but the omission is doubtless on the Spartan principle, that to imagine the possibility of a crime so base would be an insult to the commonwealth.

We can imagine Marc Antony pledging his dusky queen in all the pearls of the Orient, and some sympathizing soul, oblivious of the waste, shouting, "Hurrah for Antony!" We can see the midnight incendiary, caught torch in hand, wringing drops of pity from his captors' eyes by raising his shrivelled fingers and protesting they are cold. We can see the baffled horse thief remounted on the favorite mare and dismissed with a foaming stirrup-cup, on pleading that his legs are tired.

For acts like these some palliating feature may well be found; but, alas! who can imagine any word of extenuation falling from the pallid lips of the man who has shot a fox!

WAUZEE.

GLEN VALLEY, Va., March 1, 1884.

Editor Forest and Stream:

I don't want any beagles for hunting foxes in this country. They cannot be heard far enough, and I don't believe they can stand it. Now what I use and what I think is best for hunting the fox is a short-legged dog, with heavy bones, large feet, and very slow. With this kind of dog I can kill my fox very nearly every time. I have shot nine and my partner five. We have three hounds—two very slow dogs and one very fast bitch. We use the slow dogs until 3 in the afternoon; if the fox is not killed before that then we take off the dogs and put on the bitch. She will catch or run them down in a very short time, and we hardly ever lose a fox.

There are a good many rabbits, foxes, squirrels, partridges, ducks, etc., here. If any sportsman should pass this way let him make me a visit, and I will see that he is well taken care of. E. G. B.

SCOTT, Wisconsin.

DUKE.

SECOND BARK.

DUKE had been on his good behavior for two weeks, and it was generally believed that he had reformed when, early one morning, Mr. H. was startled by an exclamation from 'Manuel.

"Fo' goodness sake Mars H., look at dat bird!"

Coming across the lawn was a curious looking fowl, with the head of a turkey gobbler and a body that resembled a Hubbard squash that had been dipped in molasses and rolled in feathers.

"What is it, 'Manuel—it must be a wounded buzzard?"

"'Spec it am; an' dars law 'bout killin' dem buzzards. Some o' dem Smif boys bin done it, I 'spec. I'll jis go——"

"'Manuel! You 'Manuel!" and Aunt Phyllis beckoned excitedly to her man, who started toward the kitchen, as Mr. H. walked toward the bird for a closer view.

"It's too light for a buzzard, and yet—" A quick, sharp yelp from the neighborhood of the servants' quarters, and Duke sped across the field closely pursued by Aunt Phyllis and 'Manuel, armed with broom and clothes prop.

"Oh you inceitful, disrepentent hound! I'll flam yer wuss dan dat 'fi ketch you!" shouted Phyllis, as she shook the broom and stopped to pant.

"How's dat fur a prize turkey?" said 'Manuel, bitterly, as he waved his arm in the direction of the dilapidated fowl on the lawn. "Bin workin' on dat gobbla six weeks, Mars H., t' git him fat an' slick fur de powltree show. 'Spected fust t' git him fat an' slick fur de powltree show. 'Spected fust t' git him fat an' slick fur de powltree show. 'Spected fust

True to her word, Phyllis was ready to depart early next morning.

"Isn't you gwine, 'Manuel? Is you gwine ter let me go 'lone?"

"I' you don't know when you'se well off, I does; and I'se gwine 't stay well off, dat's me!" and 'Manuel turned to leave her.

"I'se jis fooled 'nough wid dat dog, and I'se gwine."

"Good bye, Phyllis."

"Good bye, 'Man," and they parted. EVERETT VON CULIN.

LICE ON DOGS.

Editor Forest and Stream:

The remedies supplied in your last issue in an article—"Lice on Dogs"—are all good, especially when applied as you direct. In addition thereto, would add that a saturated solution of common salt in water with some saltpetre, the quantity of saltpetre at pleasure, applied warm, is equally good. Kills the eggs and parasites and all is over, unless the animal is allowed to play with others infested. How many owners of dogs take care of their animals, or know how to? Right here, I will add, that a mixture of equal parts of boracic acid, vaseline, oil of tar and lac sulphur, will cure the worst case of mange with two applications, and, equal parts of vaseline and boracic acid, will cure canker of the ear with three applications.

THOMAS BUT.

UTICA, March 1, 1884.

THE NATIONAL STUD BOOK.

Editor Forest and Stream:

Nearly four years ago I paid to the Secretary of the National American Kennel Club the fees for the registration of one or two dogs. I have, in common with many more, waited patiently the appearance of their second volume of the Stud Book.

In the only report that I have seen of the late business meeting of the N.A.K.C. not one word is said about the Stud Book. Will Mr. Bryson kindly say whether the club has given the matter up as hopeless? I certainly think the many contributors of "quarters" are entitled to a report, if nothing more, for their money. Respectfully,

JAMES WATSON.

NEW YORK, March 3, 1884.

WHAT DOGS SHALL BE REGISTERED?

SOME of the breeders are discussing in the *American Kennel Register* the propriety of restricting registration in that book. We quote below the letter which has given rise to this discussion:

Editor American Kennel Register:

The writer is a subscriber to the *American Kennel Register*, is an owner of dogs registered therein, is an admirer of all dogs whose pedigrees are pure and whose deeds are untarnished, and desires not only to see pure bred dogs recognized at their true value, but also desires to protect those who can truthfully lay claim to "blue blood" from being placed upon an equality with dogs whose only recommendation is their owner's personal regard, and whose only *prima facie* evidence of respectability is the fact of their registration in the *American Kennel Register*.

The blanks, which are furnished to applicants who desire to register their canine pets, trace the pedigree back to the great grand sire and dam on the side of both sire and dam.

When a dog is duly registered and assigned a number in the *American Kennel Register* she becomes known as Lassie (A.K.R. 199), or Lassie (A.K.R. 208), or Lassie (A.K.R. 445), or Lassie (A.K.R. 623), and I think the management of the *American Kennel Register* will agree with me that a registration is, and ought to be, accepted as an evidence of freedom from bastardy, and as possessing qualities of blood or bench show or field trial records, desirable to breed from and to own.

I am an owner of pure bred dogs, and desire to protect not only myself, but also all my brethren in the field of caninology, and I know that they will indorse what I say. It has been said that "Illustration is the picture of thought," and being compelled to give examples of faulty registration, will use only the names of gentlemen who are known to be most excellent connoisseurs of purity of blood, and to possess whose friendship is both an honor and a pleasure. While in the cases of registration I shall quote, the names of the owners are in themselves a sufficient guarantee of truthfulness and respectability, yet others might enter their stock in exactly a similar manner, and both dogs and owners be, in the language of our friend Barnum, "a prince of humbugs."

To illustrate: "Fly (331), black and tan bitch, date of birth not known. Breeder, Capt. Graham, Londonderry, Ireland. Sire, Davidson's Firefly. Dam, Graham's Beauty."

"Tweed (335), black, white breast, dog, date of birth not stated. Breeder, Mr. W. B. Macbeth, Forfar, Scotland. Sire, Rob Roy. Dam, Helen McGregor."

"Lassie (199) * * * * * * *

Sire, Van Schaick's Punch. Dam, Van Schaick's Bess."

In the above cases I have transcribed from the pages of the *American Kennel Register*. Nothing else is needed than the names of the owners to insure respectability; but Smith and Jones can also send in a Tweed and Fly, and a Black or Brown can register a dog out of his Punch and Bess, and what reason have we to think that they are any better than the waifs of fortune, or perhaps it would be better to say, of misfortune, that are continually happening into existence in every back alley? What is it that makes "Burke's Peerage" a work of influence, or "Wallace's Horse Register" valuable to the breeder or owner?

What is the course of action which will make the pages of the *American Kennel Register* stand upon an equality with the above? It is to be obtained by excluding all dogs who do not produce proof of being valuable in other than the owner's eyes. The mere fact of Jack being imported from Ireland, or Jill from Scotland, is no guarantee of purity of blood. They have as many curs and mongrels over there as do we in this country. And I could ere this have entered my "Boxer," by my "Old Jack," out of my "Nell," only that I have considered that it would be lowering the standard of registration, and tend to make it a laughing stock and a by-word and reproach. Is it any evidence that my "Boxer" is any better than any other cur, because I happen to own his sire and dam?

I must beg your pardon for writing at such length; it is my purpose and desire always to condense my few ideas in as small a space as possible, and only desired in this brief squib to start the ball a rolling, and obtain the opinions of brother breeders upon this subject. In closing, I will with due humility offer the following suggestions, to wit:

First—Every dog registered in the *American Kennel Register* must have a complete authentic pedigree, as the registration blank provides; or,

Second—The parent (of the dog registered), whose pedigree is unknown, must have been placed either in a field trial or at a bench show, held under proper kennel club rules; or,

Third—The dog registered must have been placed in a field trial or taken a prize in a bench show, held under properly acknowledged kennel club rules, his pedigree according to rule first being incomplete, or the stipulation in rule second being unfulfilled.

I should be pleased to read the ideas upon this subject especially of such gentlemen as Dr. Jarvis, Dr. Downey, Mr. Moore, Messrs. Rutherfurd, Mr. Wade, Messrs. Thayer & Bros., and others.

C. VAN W. FISH,

Owner of { Lassie Regis (A.K.R. 393).
Ettrick Shepherd (A.K.R. 534).

CURRENT DOG STORIES.

XXV.

Mr. N. O. Chichester, superintendent of Arnold's chair factory, tells a wonderful dog story. On Thursday he was looking out on the river from an upper window of the factory when he discovered a dog in the ferry track, struggling hard to get out. The dog would swim along the edge of the ice, then get both feet on it and raise himself partly out of the water and fall back. The animal did this once or twice, when another dog was seen hurrying to the spot. The latter seized the half drowned dog by the neck and pulled and tugged away, vainly endeavoring to haul him out. He got him nearly out two or three times, but each time he fell back. Suddenly the would-be rescuer started like lightning for the shore, and the dog in the water kept up his struggles. In a minute or two the other dog was seen returning and there was a man with him, who was running. Dog and man reached the drowning dog in time to pull him out, and all started for the shore. When the two dogs reached the bridge which leads from the ice to the Brewery pier they laid down side by side, and made extraordinary manifestations of joy and delight, and their cries, not barks, were incessant. The dog that was saved is owned by Mr. Geo. Lumb, of Swart & Lumb Bros., and the dog that went to his rescue is a hunting dog belonging to Isaac H. Wood, of the Exchange House. Taking everything into consideration it was a most wonderful occurence.—*Poughkeepsie (N.Y.) Eagle, Feb. 6, 1884.*

XXVI.

General Cass's position on the slave question while he was a candidate for the Presidency was a subject of much discussion and no little ridicule. Among other stories told was one by a Kentuckian, who would preface his remarks by drawing from one pocket a copy of the Cleveland *Plaindealer*, and from the other a copy of the Nashville *Union*. He would then read from the *Plaindealer* the most strenuous assurances to the Democracy of the North that General Cass was a Wilmot proviso man, and from the *Union* assurances just as positive that General Cass was a pro slavery man.

"Now, I am not good at speaking," continued the Kentuckian, "but the Michigan man's position puts me in mind of a little circumstance which happened in my neighborhood in Kentucky some time ago, which I must tell you. I had a neighbor by the name of Martin, who was an uncommon clever physician and an importer of fine stock. One day the doctor stopped to get his horse shod at neighbor Bird's, the blacksmith, who lived about two miles from the doctor's house. The doctor commenced talking about his beautiful Berkshire pigs, and told the blacksmith, in a fit of liberality, that he would give him a pig out of the next litter 'Su' had.

"In the course of two months or such a matter, the doctor called at the shop and told neighbor Bird that 'Su' had had a fine litter, and to send and get his pig. So Bird posts his man Bob off with his wife's large willow basket to get the pig. Between Bird's and Martin's Sam Smith, who was a great quiz, kept a little grocery, and seeing Bob coming post haste on his master's horse old Tom, with the basket on his arm, he sang out, 'Halloo Bob, where are you going in such a hurry this morning?' 'I is gwine to Massa Doctor Martin's to get Massa Tom's Buckshur pig, what massa doctor promised Massa Tom the las' time he shod his hoss,' said the negro as he reined in his animal. 'Well, Bob, you must stop as you come back and let me see the pig.' 'Dat I will, Massa Sam, that I will,' and away he went at the top of 'old Tom's' speed.

"In less than an hour Bob returned with a genuine swine, and, alighting at the grocery, he lifted the cover of the basket, and to the astonished gaze of the grocery man, who imagined a Berkshire to be something more than a mere hog, exhibited a very beautiful specimen of a jet black pig. An idea struck Sam Smith to play a joke on Bob, and knowing his propensity to imbibe, told him to go in the grocery and get a dram. While Bob was gone, Sam Smith ran around the back of the house and got a little black pup about the same heft, and took the pig out of the basket and put the pup in. When Bob came out and mounted his nag, Sam Smith handed him the basket and off he went. On arriving at home the blacksmith asked him if he had got the pig. 'Yes, massa, and a werry fine pig he be, too,' said Bob, lifting up the cover, 'black as a coal,' when, to the utter astonishment of Bob and Bird, there lay a little black curly puppy. 'Is that a Berkshire pig?' asked the blacksmith in amazement; 'why, it is a pup, not a pig?' 'Bless de Lord,' said Bob, 'he be pig when I put him in the basket, but he changed to pup!' 'Take him back, sir,' said Bird, highly indignant, 'and tell Doctor Martin that I don't want to be fooled with his puppies, and if he don't want to give me a Berkshire pig, to say so.'

"Bob started back, and, naturally enough, he stopped at the grocer's to relate his mishaps to Sam Smith, who heard him out with a countenance expressive of wonder, at the same time doing his best to control his increasing desire to burst into fits. 'Well, get down, Bob,' said the grocer, 'and have another dram.' Bob didn't require a second invite, and while he was getting his 'bald face,' the grocer took the pup from the basket, and put back the pig. 'Massa Sam,' said Bob, coming out to mount his horse, 'I am mighty obfusticated 'bout dis pig. First I think him pig, I know he is pig first, and den I know he is pup, too. Ain't you sartin, Massa Sam, he was pig first?' asked Bob, as he mounted his crittur. 'I'll swear to it,' replied Smith, and away rode Bob for the doctor's.

"On arriving at the house, Bob delivered his message, but the doctor seeming somewhat incredulous as to the truth of the story, Bob with a flourish of insulted veracity opened the lid of the basket, when lo, there was the identical pig that he had started with. Bob stood transfixed, and with eyes protruding and mouth open, remarked: 'For God, 'taint no use, massa, he be pup or pig, just as he pleases.'" The crowd became convulsed with laughter, and gave the Kentuckian three cheers.—*Ben Perley Poore, in Boston Budget.*

XXVII.

A superior setter dog which probably had been in the woods a year or more and become wild, was lately run down by a pack of hounds and captured near Crawfordsville, Ga. He was of large size and extremely thin, but soon became tame and manageable. He is supposed to have escaped from a passing train of cars.—*Germantown Telegraph.*

XXVIII.

A shabbily dressed man, who carried a bundle loosely wrapped in a newspaper, and was followed by a small white dog that barked playfully as it snapped at his heels, walked along the west track of the Harlem Railroad toward Williamsbridge at a few minutes before 8 o'clock yesterday morning. At the curve a few hundred feet south of the station the man stepped to the east track to avoid a south-bound train that he saw coming. The dog ran ahead of him, and barked at the train as it passed. The noise of the train drowned the noise made by rapid transit train 24, north-bound on the east track. The engine struck the man and killed him. It also struck the dog and broke his leg. When the train was stopped the dog, with one of its fore paws hanging disabled, stood whining over the dead man. At first it flew savagely at those who tried to remove the body, but finally, appearing to understand that their intentions were friendly, caught the coat collar of the dead man and tried to move him. The body was lifted on a shutter and carried to the Tremont station. The dog followed a short distance, and then disappeared. All who witnessed the scene, and others who were told of it, were anxious to find the dog and care for its injured leg. A search was instituted for it by over 100 people, including policemen, and kept up last night, but without success.—*Sun.*

XXIX.

A good story is told of the presence of mind of a New Hampshire deacon, who was very fond of dogs. He had one valuable setter that he had trained himself, and that understood his every word and slightest gesture with an almost human intelligence. One evening at a prayer meeting the good man was offering an earnest exhortation and the people sat with bowed heads, giving earnest attention. The audience faced the stand where sat the pastor; the doors opened on either side. All at once one of the doors, which had been left ajar, was pushed open and the handsome head of the deacon's favorite setter was thrust in. The head was followed by the body, and the dog in toto had just started with a joyful bound toward its master. The deacon generally knew what was going on about him, whether he was praying or shooting, and the first movement of the intruder attracted his attention Quick as a flash the deacon, raising his hand with a warning gesture, exclaimed, "Thou hast given us our *charge;* help us to keep it." At the emphasized word, so well known to his canine ear, the handsome brute stopped, as if shot, on the very threshold of the door, with his intelligent eye fixed on his master. In the same unmoved tone, with a slight wave of the extended hand, "We would not return *back* to Thee with our duty on earth unfulfilled." Again the perfect training of the deacon's pet was made evident, for without a whimper he turned as noiselessly as he had entered, and remained quietly outside until his master appeared.—*Boston (Mass.) Globe.*

REMEDY FOR WORMS.—Savannah, Ga.—*Editor Forest and Stream:* After trying many remedies and losing many valuable whelps from worms I find the best remedy for that complaint to be twenty drops of Fahnestock's vermifuge, given twice a day for three days to a puppy four weeks old, and in proportion according to the age. It was prescribed by my physician for my child. After trying santonin, areca nut, turpentine and oil on my pups I lost two, and the rest were greatly reduced, so much so that on leaving them at night I expected them to be dead in the morning. My wife suggested the vermifuge. I used it, and with wonderful result, each puppy passing worms enough to have filled a tea cup; and now they are well. It acted in about four hours after the first dose, continuing through the next day. I send you this, hoping it may be of as much benefit to your readers as it has been to me.—VITUS.

A HOUND'S SINGULAR DEATH.—Oxford, Me., Feb. 25.—Last Saturday a fox driven by a hound took for the railroad track. The fox was so loaded down with snow and rain as to be hardly able to drag one foot after the other. There it was met by an approaching train and barely cleared the track in time to save its life. The pursuing hound was less fortunate, and was ground to pieces beneath the wheels of the locomotive. The hound was owned by Samuel Wardwell, of Oxford, Me. He refused an offer of $100 last fall for her.—JOSH. JEEMS.

A COLLAR FOR NO. 1000.—The *American Kennel Register* numbers for March rise up into the four digits. The Medford Fancy Goods Company, 101 Chambers street, have emphasized this progress of the *Register* by giving one of their handsome collars to the thousandth dog. As the *Register* is not out yet, we are not at liberty to give the name of the fortunate dog, but it will be announced next week.

CINCINNATI DOG SHOW.—*Special Dispatch to Forest and Stream:* There were about 300 dogs present at the opening of the show. Many of the best dogs in the country are here. The attendance is very good for the first day.—M.

MR. W. H. PIERCE, of the Glencho Kennels, Peekskill, N. Y., has been spending the winter, with several of his dogs, shooting in Volusia and Hernando counties, Fla. He reports excellent quail, snipe and duck shooting.

NEW HAVEN DOG SHOW.—Judging of sporting classes will be commenced by Mr. Watson at 11 A. M. instead of at 2 P. M. on March 12.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Busy and Baneful. By Mr. T. G. Tucker, South Gaston, N. C., for Byron foxhound bitches, whelped Feb. 25, by Epps (Brodnax's Spot ——) out of Bett (Watchman—Hannah).

Donald II. By Mr. C. M. Munhall, Cleveland, O., for liver and white ticked pointer dog, whelped August, 1882, by champion Donald out of Devonshire Lass (Don—Lady).

Blue Frisk. By Mr. J. M. Avent, Hickory Valley, Tenn., for black, white and tan English setter bitch, whelped Aug. 29, 1883 (Rush Gladstone—Clara).

Brit. By Mr. Dan Storrs, Lebanon, N. H., for black, white and tan beagle dog, whelped Aug. 16, 1883, by Mr. N. Elmore's imported Ringwood out of Thorne.

Queen Bow. By Mr. George Hoover, Canal Fulton, O., for lemon and white pointer bitch, whelped Nov. 14, 1883, by King Bow (A.K.R. 83) out of Bow Queen (A.K.R. 558).

Pert. By Mr. Eugene D. Chaplin, Bridgton, Me., for liver cocker spaniel bitch, whelped Aug. 10, 1883, by Piper (Col. Stubbs—Beauty) out of Quand (Captain—Fanny Fern).

Pat Glencho, Mike Glencho, Dan Glencho, Dick Glencho, Mack Glencho and Ned Glencho. By Mr. Wm. K. Lente, Seville, Fla., for red Irish setter dogs, whelped Jan. 27, by Glencho out of his Trix (A.K.R. 187).

Eileen Trix, Bridget Trix, Kathleen Trix and Queen Trix. By Mr. Wm. K. Lente, Seville, Fla., for red Irish setter bitches, whelped Jan. 27, by Glencho out of his Trix (A.K.R. 187).

Pippo. By Mr. Joseph D. Culver, New London, Conn., for red Irish setter dog, whelped July 21, 1883, by Elcho (A.K.R. 295) out of Meg (A.K.R. 425).

Dashing Ruby. By Mr. L. F. Patterson, Bainbridge, Ga., for liver pointer bitch, whelped July 24, 1883, by Nip (Rush—Tina) out of Josie (Bow—Topsy).

Bluster, Boaster and Brantor. By Mr. T. G. Tucker, South Gaston, N. C., for Byron foxhound dogs, whelped Feb. 25, by Epps (Brodnax's Spot— ——) out of Bett (Watchman—Hannah).

Tuck. By Mr. J. W. Gross, Harrisburg, Pa., for black, white and tan beagle bitch, whelped Nov. 26, 1883, by Ringwood (Ranter—Beauty) out of Myrtle (Rattler—Lulu).

Nora II. By Mr. John Wilkinson, Vermont, Ill., for red Irish setter bitch, whelped July 9, 1883 (Rory O'More—Nora O'More).

Sport. By Mr. Arthur D. Martin, Hartford, Conn., for English setter dog, whelped April, 1883, by Echo (Fly—Queen) out of Pearl (Duke—Nell).

Belle Ringwood. By Mr. A. C. Krueger, Wrightsville, Pa., for white, black and tan beagle bitch, whelped Nov. 13, 1883, by imported Ringwood out of Belle.

Bessy. By Mr. Haven Doe, Salmon Falls, N. H., for black, white and tan beagle bitch, whelped Nov. 21, 1883, by imported Ringwood out of Music III.

Bunny. By Mr. Haven Doe, Salmon Falls, N. H., for black, white and tan beagle dog, whelped Nov. 13, 1883, by imported Ringwood out of Belle.

Fritz. By Mr. C. W. Littlejohn, Leesburg, Va., for lemon and white ticked pointer dog, whelped June 7, 1881 (Beaufort—Spot).

Pilot. By Mr. C. W. Littlejohn, Leesburg, Va., for lemon and white pointer dog, whelped June 23, 1880 (Scout—Spot).

Nip. By Mr. J. W. Gross, Harrisburg, Pa., for black, white and tan beagle dog, whelped Nov. 12, 1883, by Ringwood (Ranter—Beauty) out of Silver (Flute—Bess).

BRED.

☞ *See instructions at head of this column.*

Lassie—Glencho. Mr. T. D. Husted's (Peekskill, N. Y.) red Irish setter bitch Lassie to Mr. W. H. Pierce's Glencho (Elcho—Noreen), Feb. 9.

Claire—Glencho. Mr. James T. Walker's (Baltimore, Md.) red Irish setter bitch Claire (A.K.R. 233) to Mr. W. H. Pierce's Glencho (Elcho—Noreen). Feb. 11.

Bessie—Don. Mr. Wm. H. Force's (New York) pointer bitch Bessie (Sensation—Minnecla) to Mr. R. T. Vandevort's Don (A.K.R. 165), Feb. 3.

Beasey—Glencho. Mr. Charles J. Steward's (New York) red Irish setter bitch Beasey to Mr. W. H. Pierce's Glencho (Elcho—Noreen), Jan. 23.

Juno—Glencho. Mr. Geo. Langran's (Yonkers, N. Y.) red Irish setter bitch Juno (Berkley—Tilley) to Mr. W. H. Pierce's Glencho (Elcho—Noreen), Jan. 30.

Polly—Bang Bang. Mr. H. B. Tallman's (Providence, R. I.) lemon and white pointer bitch Polly (Beaufort—Nymph) to Bang Bang (A.K.R. 394), Feb. 16.

Dessey—Don. Mr. A. R. Hayward's (Rock Hill, S. C.) pointer bitch Dessey (Percy's Fowler—Vixen) to Mr. R. T. Vandevort's Don (A.K.R. 165), Jan. 19.

Ruby—Scout. The Knickerbocker Kennel Club's liver and white pointer bitch Ruby (Dick—Fan) to Mr. D. G. Elliot's Scout (A.K.R. 216).

Fanchon—Young Toby. Mr. F. H. Adams's (Pawtucket, R. I.) pug bitch Fanchon (Echo—Victoria) to the Chequasset Kennel's imported Young Toby (A.K.R. 473), Feb. 23.

May—Rebel Windem. Mr. R. M. Brown, Jr.'s (Amherst C. H., Va.) English setter bitch May (Lincoln—Daisy Dean) to Rebel Windem, Feb. 21.

Pearl Blue—Gun. Mr. Chas. York's (Bangor, Me.) English setter bitch Pearl Blue (Royal Blue—Oryad) to his Gun (Gladstone—May B.), Nov. 1.

Surf—Icicle. Mr. Chas. L. Lundy's (Cincinnati, O.), orange and white pointer bitch Surf (Bow—King's Maid) to Mr. Geo. W. Fisher's Icicle (A.K.R. 82), Feb. 21.

Flora—Glen II. Mr. G. A. Coleman's (Charlestown, Mass.) Gordon bitch Flora (Tom—Chloe) to Mr. Geo. E. Brown's Glen II. (Dr. Aten's Glen—Border Lilly).

Hornell Daisy—Hornell Silk. The Hornell Spaniel Club's (Hornellsville, N. Y.) liver cocker spaniel bitch Hornell Daisy (Benedict—Flirt) to their Hornell Silk (Obo—Chloe II.), Jan. 26.

Hornell Belle II.—Hornell Silk. The Hornell Spaniel Club's (Hornellsville, N. Y.) black and tan cocker spaniel bitch Hornell Belle II. (Hornell Dandy—Hornell Belle) to their Hornell Silk (Obo—Chloe II.), Feb. 9.

Princess Rose II.—Rebel Windem. Mr. R. S. Terry's English setter bitch Princess Rose II. (Gladstone, Jr.—Princess Rose) to Rebel Windem, Feb. 23.

Frost's Queen—Rebel Windem. Mr. A. S. Payne's English setter bitch Frost's Queen (Scout—Frost) to Rebel Windem, Feb. 15.

Ress—Rush Gladstone. Mr. J. E. Mask's (Hickory Valley, Tenn.) black setter bitch Ress (Mark—Vic) to Mr. J. M. Avent's Rush Gladstone (Gladstone—Donna J.), Feb. 17.

Countess A.—Count Noble. Mr. J. M. Avent's (Hickory Valley, Tenn.) English setter bitch Countess A. (Dashing Lion—Armida) to Count Noble, Dec. 25, 1883.

WHELPS.

☞ *See instructions at head of this column.*

Princess Eugenia. Mr. H. C. Sherman's English setter bitch Princess Eugenia (Ranger III.— ———). Feb. 17, ten (eight dogs), by Mr. W. A. Coster's Buckelew (A.K.R. 30); all orange and white ticked.

Model Blue. Mr. A. P. Garland's (Ipswich, Mass.) English setter bitch Model Blue (Druid—Gussie), Feb. 18, nine (five dogs), by Mr. A. M. Tucker's Dash III.

Matchless. Mr. F. Thurls's (Newburyport, Mass.) English setter bitch Matchless, Feb. 13, nine (four dogs), by Mr. A. M. Tucker's Dash III.

Pearl Blue. Mr. Chas. York's (Bangor, Me.) English setter bitch Pearl Blue (Royal Blue—Oryad), Jan. 2, twelve (seven dogs), by his Gun (Gladstone—May B.).

Bett. Mr. Rhos. Goode Tucker's (South Gaston, N. C.) Byron foxhound bitch Bett (Watchman—Hannah), Feb. 25, five (three dogs), by Epps (Broduax's Spot— ———).

Fan. Mr. E. C. Alden's (Dedham, Mass.) champion black pointer bitch Fan (Pete—Belle), Jan. 19, five (three dogs), by his champion Pete, Jr. (Pete—Nell).

SALES.

☞ *See instructions at head of this column.*

Countess Rake. Black, white and tan English setter bitch, 2½ years old (Rake—Phyllis), by Mr. Edward Odell, New Orleans, La., to Mr. J. B. C. Lucas.

Antea II. Fawn mastiff bitch (A.K.R. 685), by the Riverside Kennel, Clinton, Mass., to Mr. W. H. Herrick, Montpelier, Vt.

Ralph H. Red Irish setter dog, whelped June 9, 1883, by Ronold (Elcho—Rose) out of Nellie B. (Dash—Creena), by Dr. J. R. Housel, Watsontown, Pa., to Mr. Geo. Snyder, Almota, W. T.

Floss II. Liver and white cocker spaniel bitch, age not given (Handy—Nellie Coporn), by Mr. L. C. Andrus, Malone, N. Y., to Dr. G. H. Kidney, same place.

Lute. White beagle bitch, whelped June 23, 1882 (Ringwood—Norah), by Mr. T. T. Phlegar, Pearisburg, Va., to Mr. C. F. Kent, Monticello, N. Y.

Nashie. White, black and tan beagle bitch, whelped June 23, 1883 (Ringwood—Norah), by Mr. T. T. Phlegar, Pearisburg, Va., to Mr. C. F. Kent, Monticello, N. Y.

Elcho—Rose whelp. Red Irish setter bitch, whelped Aug. 4, 1883, by Dr. Wm. Jarvis, Claremont, N. H., to Mr. J. A. J. Sprague, Englewood, Ill.

Freund. Orange and white rough-coated St. Bernard dog, whelped Aug. 2, 1883 (champion Bonivard—Theon, A.K.R. 94), by the Chequasset Kennels, Lancaster, Mass., to Mr. Chas. Parsons, Jr., New York.

Cæsar. Orange, with white markings, imported rough-coated St. Bernard dog, whelped July 5, 1879 (A.K.R. 22), by the Chequasset Kennels, Lancaster, Mass., to the Forest City Kennels, Portland, Me.

Salme. Fawn pug dog, whelped Oct. 11, 1883 (Little Boffin—Santa), by Mr. F. B. Lucy, Boston, Mass., to Mr. C. H. Andrus, same place.

Tokie. Black and white Japanese spaniel, 2 years old (Jim Willie—Tokio), by Mr. F. B. Lucy, Boston, Mass., to Mrs. Dr. Kimball, Lowell, Mass.

Benglo. Black and white Japanese spaniel, 2 years old (Larley—See So), by Mr. F. B. Lucy, Boston, Mass., to Mr. M. Hodges, same place.

Game. English setter dog, whelped Dec. 31, 1883 (Dashing Dan—Daisy Starlight), by Mr. H. W. Durgin, Bangor, Me., to Mr. F. S. Davenport.

Dashing Dan—Daisy Starlight whelps. English setter dogs, whelped Dec. 31, 1883, by Mr. H. W. Durgin, Bangor, Me., a lemon belton to Mr. R. L. Henry, Hamden, Conn., and a blue belton and tan to Mr. Twombley, Boston, Mass.

Norena. Red Irish setter bitch, whelped July 30, 1883, by champion Elcho (A.K.R. 295) out of champion Noreen (A.K.R. 397), by Dr. Wm. Jarvis, Claremont, N. H., to Dr. J. Frank Perry, Boston, Mass.

Quail II. Red Irish setter bitch, age not given (Red Gauntlet—Quail II.) by the Rory O'More Kennel, Albany, N. Y., to Mr. A. P. Pope, Olean, N.Y.

Sontag. Imported black and tan cocker spaniel dog, whelped March 6, 1879 (Briar—Gypsy), by Mr. J. W. Rushforth, Yonkers, N.Y., to Dr. C. T. Hubbard, Taunton, Mass.

Gypsy O'More. Red Irish setter bitch, whelped July 6, 1883 (Rory O'More—Quail III.), by the Rory O'More Kennels, Albany, N. Y., to Mr. Jas. A. Stimson, Cohoes, N. Y.

Sylvia. Red Irish setter bitch, age not given (Rory O'More—Sampson's Nora), by the Rory O'More Kennels, Albany, N. Y., to Mr. Jas. A. Stimson, Cohoes, N. Y.

Dash III.—Katydid whelps. Black and white English setters, dog and bitch, whelped Dec. 14, 1883, by Mr. E. H. Fisher, New Bedford, Mass., to Drs. C. T. Hubbard and J. W. Hayward, Taunton, Mass.

Katydid. Black and white English setter bitch, whelped May 19, 1881 (Guy Mannering—Whirlwind), by Mr. E. H. Fisher, New Bedford, Mass., to Drs. C. T. Hubbard and J. W. Hayward, Taunton, Mass.

Wallace. Red Irish setter dog, whelped June 5, 1883 (Ruby—Kit), by Miss Ida F. Warren, Leicester, Mass., to Mr. Charles E. Sanford, Worcester, Mass.

Grace B. Black and white English setter bitch, 21 months old (London—Dawn), Mr. H. Bailey Harrison, Tilsonburg, Ont., to Mr. C. Fred. Crawford, Pawtucket, R. I.

Mack B. Lemon roan English setter dog, 16 months old (Dick Laverack—Twilight), by Mr. H. Bailey Harrison, Tilsonburg, Ont., to Mr. C. Fred. Crawford, Pawtucket, R. I.

Gem. Lemon and white English setter bitch, 16 months old (Dick Laverack—Twilight), by Mr. H. Bailey Harrison, Tilsonburg, Ont., to Mr. C. Fred Crawford, Pawtucket, R. I.

Belle II. White, black and tan beagle bitch, whelped Oct. 23, 1881 (King—Belle), by Mr. A. C. Krueger, Wrightsville, Pa., to Mr. Charles F. Kent, Monticello, N. Y.

Judge. White, black and tan beagle dog, whelped Aug. 24, 1883 (Rattler II.—Rena), by Mr. A. C. Krueger, Wrightsville, Pa., to Mr. Geo. L. Barnes, Tyringham, Mass.

Kitty. White, black and tan beagle bitch, whelped Aug. 24, 1883 (Rattler II.—Rena), by Mr. A. C. Krueger, Wrightsville, Pa., to Mr. J. H. Morgan, Baltimore, Md.

DEATHS.

☞ *See instructions at head of this column.*

Rainbow. Liver and white pointer dog (champion Bow—Roxie), owned by Mr. Edward Odell, New Orleans, La.

Minnie. Lemon and white pointer bitch, 7 years old (Sensation—Whiskey), owned by Mr. Elliot Smith, New York, Feb. 25, from paralysis.

Nellie Horton. Black and tan Gordon setter bitch, 7 years old (Duke of Gordon—Tilley's Dream), owned by Mr. George E. Brown, Dedham, Mass., Feb. 19, cause unknown.

Rector. Lemon and white pointer dog (A.K.R. 700), owned by Mr. Forest W. Forbes, Westboro, Mass., Feb. 15.

Bruce. Liver spaniel dog (A.K.R. 728), owned by Mr. J. W. Rushforth, Yonkers, N.Y., Feb. 14, from distemper.

Dandy III. Black spaniel dog (A.K.R. 730), owned by Mr. J. W. Rushforth, Yonkers, N.Y., March 2, from distemper.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

H. B., Holton, Kan.—A puppy two months old, if in good health, should stand the journey this time of year.

Verax, Port Rowan, Ont.—Bathe the eyes twice daily with a wash composed of five grains borax and one ounce rosewater.

H. K., East Saugus, Mass.—Give an accurate description of the wart and its exact location and we will advise as to its removal.

F. W., Dunkirk, O.—Have a little patience. When he recovers his strength he may come all right. Bathe with cold tea twice a day.

C. F. R., Washington, D. C.—1. We would not advise breeding so near relatives. 2. We have no picture of Dash. 3. See Kennel department.

A. R., Cape Girardeau, Mo.—Your dog is probably ruined, and it would pay you better to get rid of him and get another that has not got his bad habits.

L. & T., South Royalton, Vt.—Keep the bandage on the foot wet with chloride of zinc—three grains to the ounce of water. Give him occasional small dose of Epsom salts.

J. H. W., Philadelphia, Pa.—We doubt if she will show any after-effects of the accident as a breeder, and you will know nothing of it so far as her field qualities are concerned. Dry her up as soon as possible and destroy the pups.

C. F. W., Palmyra, O.—Dress with sulphur and lard ointment. Give five drops of Fowler's solution of arsenic in her food twice a day and increase one drop every second day up to twelve drops, and keep up the treatment until you see an improvement or she shows bloodshot eyes.

S., Ogdensburg.—It is a failing with short-legged spaniels to get crooked in front. Is the leg bone crooked, or is your pup loose-jointed and out at elbows? Your treatment of the bitch was correct; but you should give a change from the cornmeal and oatmeal diet. Give bread, meat and vegetables mixed. Tone the system up a little, and do not be afraid of meat until you see an improvement in her appearance. Dogs require meat, and you do not seem to give your bitch any. Do not feed more than twice a day under any circumstances, and the morning meal should be light.

SCIENCE OF RIFLE SHOOTING.

Editor Forest and Stream:

I beg to submit the following answers to the queries of Messrs. "J. J. P." and "G. W. F.," in your issue of Feb. 21, from the standpoint of a reader of Forest and Stream interested in such subjects, with the view of starting the discussion requested:

No. 1.—If I understand the question, the answer may be: The forces are quite different; in the first case the effect of the wind is a rather complex one, dependent, for the most part, upon the strength and direction of the breeze, and the velocity, shape, area presented by and weight of the bullet. In the second case, it is mainly gravity. An instance might occur where the effect of the two adjustments would be equal in amount, and—aiming toward the zenith—where wind disturbance of the trajectory and that caused by elevating the rear sight would be equal and opposite, but by no mechanical contrivance could they be made to vary in the ratio of their respective forces, the cases of possible difference being so infinitely great in number.

No. 2.—The maximum pressure depends in amount upon the density of the gaseous products of combustion at the instant the projectile starts (which is not saying the projectile does not sometimes start before the maximum is reached) and the amount of upset depends upon this pressure. It is clear that air space will diminish this density and hence the pressure.

The upsetting of a naked bullet should be merely sufficient to increase the diameter to such a point as will effect a normal rotation, as anything more entails no end of evil features, among which may be mentioned, a loss of useful energy of the charge in excessive molecular distortion of the bullet, and hence in heat; in friction on the walls of the bore, and finally in accuracy of the projectile once outside. With too quick powder air space may be necessary to eliminate all these difficulties. With heavy or old powder it may be a positive disadvantage. With the heavy charges used in large artillery its use is indispensable, as no gun metal is strong enough to stand the strains without.

If not necessary, it entails a loss in useful length of bore as the velocity depends, other features being equal, upon the number of times the charge is expanded from its original volume.

No. 3.—Winchester's or any other, I think the blast from the primer should be just sufficient to ignite the point in the charge to which it is applied. Otherwise there is a possibility of burning the charge under greater pressure than it will itself furnish, not only through the undue accession of gas from the primer, but from pulverizing the powder grains and enhancing their rate of combustion. Valuable notes on this subject may be found in Berthelot's latest lecture on explosives.

No. 4.—If the diameter of the patched portion of the bullet and the material of the patch are suited to the caliber and the rifling, and the weight of the bullet to the nature of the powder, that is to say all else being equal, lubrication is a source of gain in energy to the bullet, and I think it can be applied with suitable uniformity. It is quite possible to imagine conditions where a lubricant would be disadvantageous. Having, in particular, powder, the qualities of which are indefinite, this can only be determined by experiment. Any tyro can make such experiments for himself if he be patient and weigh well all his results.

No. 5.—The question is just a little vague, but if I understand the querist correctly, I think it is because, for the same wind, a displacement of the gauge on a short piece is less than with a long one, and the habit of the eye in sighting with no gauge is less deranged, enabling the marksman to adjust himself with less change of position. It seems probable also that with either long or short guns there would be with most men less change from the habitual and natural position in aiming, the wind gauge being placed at the muzzle.

No. 6.—The patching and bullet must be concentric, or, better, the center of gravity of the bullet must be in its axis, and the patching of uniform thickness and flexibility, otherwise the bullet will not center itself, and the flight will be a spiral.

No. 7.—There is a certain lack of relation between the features referred to in the beginning of the question, but the latter may be answered by a "Yes" if the weight of the bullet is not greatly changed by a lack of uniformity in its composition. It is quite clear that the release of the patch, as usually made, is of the first importance.

Referring to the latter part of the question, it is more certain to be separated from the bullet, if in contact with the charge, the pressure and heat being greater in this position.

No. 8.—I am not perhaps qualified to fully answer this question, not being a professional marksman, but think that much of the disadvantage in the change of light may be eliminated by the use of a shade susceptible of being pivoted in three directions, to be placed at will on either side of the piece abreast the rear sight. The difficulty is usually caused by the interference of rays of light reflected by the surfaces of the different positions of the sight, in variable quantity and quality with a change in the position of the sun. The effects referred to may be studied with a candle placed in different positions near the rear sight and the benefits of the suggested shade illustrated.

No. 9.—A most important question, not specially so in regard to the selection of the powder maker, but of the powder. Each weight and caliber of bullet should have its suitable charge in which the quality of the powder is quite as important a feature as the quantity. The weight of the bullet being fixed, the question is to develop the highest velocity with accuracy, within the limits of safety and distress in recoil. A long series of experiments will alone establish the powder charge best suited to each class, in which the nature of the powder as affected by its specific gravity, its size of grain and special features of ingredients or manipulation in manufacture will be the task of the investigator. It will be answered. This is all done now, but I think not so to a sufficient extent, else there would be fewer queries. I have no doubt many of the powder manufacturers can produce good work and can vary the qualities of their product at will. I do know however, that the scientific knowledge and experience brought to bear in their profession by the Messrs. Dupont are quite on a level with the importance of the question. In common with other readers of Forest and Stream I shall look with interest for the disclosure promised by "J. J. P." at a later day.

Queries by "G. F. W." First—It depends principally as remarked in response to "J. J. P.," upon the nature of the powder. Each new lot you receive, experiment a little to see if air spacing prove beneficial. In no case, however, compress the powder. If you allow nothing between bullet and charge, place the former simply and crimp without force, having previously tapped the charge down to its smallest volume.

Second—All the flaming particles seen at the muzzle of a gun on discharge are not partially burned powder. This effect is usually caused by the solid products of combustion heated to incandescence. Powder, however, may be, and frequently is, blown out unburned, but (among fifty other possible causes) it is perhaps too dense, or the relation between the weights of the charge and projectile and the length and caliber of the bore has not been correctly established.

It has been found that ignition at the front end of the cartridge increased slightly the velocity of the projectile—probably because there is less vibration of the gaseous wave as the projectile travels down the bore—thus giving a more uniform impulse to produce acceleration.

W. M. F.

Annapolis, Md., Feb. 28.

MILITIA SHOOTING EAST AND WEST.

The Hartford *Courant*, speaking of the work of the State National Guard on the ranges, says:

"The splendid results of the season's work are deserving of more than a limited notice when it is considered how important this branch of the service is to the military service of the State. A military organization with gaudy uniforms, marching with perfect alignments and steady step, is applauded as the perfection of military discipline, and so far as it goes it is well deserved, but one of the vital qualifications of a soldier is his ability to use his rifle with effect. This can only be accomplished by systematic and persistent practice with the majority of recruits. The present system of target practice in the Connecticut National Guard requires that every man shall begin to shoot at 100yds. distance; if he succeeds in making 13 points out of a possible 25, he is promoted to the next class, which is 200yds.; there are the same conditions to the second class, which is 300 and 400yds. All men who can make 50 per cent. of a possible score at the latter range are then in the first class and can shoot for the marksman's badge. The distances are 200 and 500yds., and five shots are allowed at each range. Two trials only can be made, and if a guardsmen succeeds in making a 50 per cent. score he is a marksman and entitled to wear the State badge. If he makes an 80 per cent. score, or better, he receives a silver bar or badge with the word 'sharpshooter' inscribed thereon. Each year a man must demonstrate his ability to shoot by going back into the second class and advancing as before. So it will be seen that our citizen soldiers are put through a practical course of training in the use of a weapon which is too often carried by men who haven't the slightest knowledge of its use. The value of this course of discipline cannot be overrated. Since target practice was first established for the C. N. G. the First regiment has led the entire brigade in the number of marksmen. In 1879 the entire brigade had 567 marksmen, of which the First had 306. In 1880 the brigade had 546, of which the First regiment, with ten companies, had 316. In 1881, out of 387 in the entire brigade, the regiment, with eight companies, had 267. In 1882 the total was 394, of which the First regiment had 160. It is generally known, of course, that there are four regiments and a battalion of three companies, besides a battery of artillery in the brigade. It will be easy to estimate that the First regiment has averaged as many marksmen as the entire rest of the brigade, and can appropriately be called the "shooting regiment." In 1880, when the regiment qualified 316 marksmen, there were two more companies in the regiment and over two hundred more men on the rolls than at the present time. We give below the figures of each company, and it is safe to conclude that no other regiment in the country can equal it:

	Marksmen.	Sharpshooters.	Total.
Field and Staff	5	9	14
Company A	50	2	52
Company B	35	7	42
Company D	14	1	15
Company E	27	3	30
Company F	42	18	60
Company G	13	3	16
Company H	28	16	44
Company K	44	19	63

Company K qualified every member of the company and Company F all but one."

In the far away State of Minnesota there does not come such a favorable report. C. M. Skinner, of Co. B, 1st Regiment, says in a recent letter: "The result of battles is decided largely by the number of guns, large and small, their range, and above all, by the skill with which the gunners use them.

Recognizing this fact, those in authority in all civilized nations are taking great pains, and expend a large amount of money to perfect as far as possible, the rank and file of their armies in the use of their rifles as an implement to shoot with, and every inducement is held out in the way of prizes, badges of distinction, honor, etc., to bring out the highest degree of skill. This has been going on in all European countries for twenty years and upward and never have they been more interested in it than at the present time.

The War Department of our own country now authorize the expenditure of large amounts of ammunition for target practice, and any one who has witnessed the annual department contests at Fort Snelling can but notice the earnestness with which the soldiers enter the contests, and be surprised at the great accuracy displayed up to 600yds. In a government like ours, whose chief strength is the National Guards and volunteers, all see the importance of having them as well skilled in the use of firearms as possible.

In all Eastern States the militia have already attained an enviable degree of skill as marksmen.

But at the West, with the exception of the single State of Michigan, which last fall bore away the Hilton trophy from Creedmoor, there has been nothing done, except what a few companies have done at their own expense. In fact, it would seem that they have been discouraged by those in authority.

I hold that no better looking, abler bodied, more courageous, better disciplined, better drilled in manual of arms and field movements exist in the country than our own Minnesota National Guards; but alas! 200 buffalo hunters who don't know a "carry" from a "present" arms, or a "right wheel" from a "parade rest," in an open plain would drive the National Guard of Minnesota from the field. The reason is obvious, but few of the gentlemen know what to do with their rifles at 200yds., and almost none at 400, 500 and 600yds.

The staff officers could create a good deal of interest with the company officers, and they with their men. A captain can lead his men to the target, as well as to a bayonet charge, an exhibition drill, dress parade, or ball.

Target practice is now a very prominent feature of the annual encampments of all Eastern troops, and the result is eagerly watched by staff and State officers, and this is as it should be. Thus far Minnesota has done nothing to encourage rifle practice among her National Guard. No State range has been laid out, and the militia are furnished the liberal supply of 1,000 cartridges per company, about 15 or 18 per man, an amount that ought to be fired each month, but they have positive instructions to never use them.

Several companies have done some 200yds. work at their own expense, and some of the shooting has been very creditable. The greatest effort made by any company, perhaps, was by "B." Company First Regiment, who entered a team of six men to contest for the champion military badge at Fort Snelling last September, and as they had no opposition bore it away in triumph. The W. R. A. has done more to get up an interest in military shooting in the West, among the militia, than all other agencies put together. Special matches have been made and liberal prizes offered for two years at their tournaments at Fort Snelling. The first year saw their prize, the champion military badge, go to "C" Company, Seventh Infantry and carried away to Ft. Laramie. Last September, recognizing the fact that they must get the commissioned officers interested, they offered an elegant silver cup valued at $25 in a commissioned officers' match, especially gotten up for commissioned officers of the National Guard, but on the day of the match but one commissioned officer was on the ground and he was from Illinois, although both match and prize were liberally advertised.

The Association, doomed to disappointment at not getting any entries from the National Guards, they offered it to the United States Army commissioned officers and it was carried off by Lieut. Emery. This apathy on the part of the commissioned officers of the National Guards is easily explained, no one was in practice, no one wanted to be laughed at for their poor scores; or the awkward handling of their guns.

If any here would inquire why the W. R. A. are so solicitous about the skill of the N. G., I would answer that most of its members and warmest supporters are ex-soldiers and know the need of having the

militia well skilled in the use of their rifles, and the W. R. A. was organized, as one of its sections reads, to encourage the art of rifle shooting, and especially that of the N. G. They have met with but little encouragement so far but are on a good footing and still hopeful. Let the officers decide that target practice shall be made a part of each day's programme at the annual encampments. Targets can be constructed at small expense. Select no camp ground where target practice cannot be had. If we can't get ammunition from the State, let's furnish our own and petition the Legislature when in session to authorize the issue of 250 rounds per man per annum; have company, regimental and a State inspector of rifle practice, let the score be kept and a report made to the Adjutant-General, annually of the result of the year's practice, and the number of 3d, 2d and 1st class marksmen and sharpshooters there are in the State. Provide marksmen and sharpshooters' badges for those who win them. Finally, and of greatest importance, let all commissioned officers wake up to the importance of skilling our National Guards in the art of rifle shooting. Encourage the men by their presence on practice days, but better still, take a rifle and lead the score themselves, and we will soon overtake our Eastern brethren who at present are so far ahead of us in this respect."

RANGE AND GALLERY.

BOSTON, March 1.—There was but a small attendance to-day at Walnut Hill, and the scores made were not high. The snow which covered the ground made a bad light, which considerably troubled the riflemen. The highest records made are appended:

W Charles	5555555554—48	C B Edwards	4454444545—43
W Gardner	5544555455—47	J Payson (mil)	4454444445—42

ZETTLER VS. FRELINGHUYSEN.—Monday evening a well-contested match was shot between the Zettlers, of New York City, and the Frelinghuysen Club, of Newark, on the range of the former, No. 207 Bowery. The shooting opened at 8:15 and continued until 1:30 A. M., resulting in favor of the Zettlers. As the above club has shot over one hundred matches, and have been in all victorious, the visiting club may feel proud of their score, their opponents leading them only by five points. The return match will be shot on March 19 at the Frelinghuysen range, No. 189 Market street, Newark, N. J. The following score was made:

Zettler Team.

Zettler Rifle Club held its regular weekly shoot Feb. 26, 12-ring target.

A Lober	110	T Fitz	110
C Judson	112	B Zettler	111
M Dorrler	115	H Holges	108
P Fenning	110	V Stembach	108
M B Engler	114	T C Noone	97
C G Zettler	113	H Puckhaber	95

DENVER, Col., Feb. 22.—As early as 8 o'clock this morning the trains of the Circle road were filled with members of the First Infantry Regiment, on their way to the Jewell Park range to engage in the contests with the rifle which had been arranged to occur on Washington's Birthday.

The first shoot was between the Routt Rifles and the Governor's Guard for the State championship, which was won by the latter company two years ago in a series of contests with the Sherley Light Infantry, of Leadville, and has been held by it ever since. The judges were Major Bedson and Mr. J. T. Bourke, and the referee was Mr. J. P. Lower.

The shooting commenced at 10 and continued for two hours. A very high wind prevailed during the entire day and caused the scores made to be very poor. J. N. Lower, of Company B, made the highest score, thirty-eight, while on a fair day there are at least five men on each team who may be counted upon to make forty or over. The shooting was off-hand, two hundred yards, ten shots per man, and the score is as follows:

Governor's Guard.		Routt Rifles.	
J N Lower	38	K E Noah	28
W A Rice	27	E H Cling	31
C C Compton	32	C J Kelley	33
Geo Henderson	24	A E Schaffer	32
Leo Marix	33	G H Sill	31
G Coryell	23	Capt E A More	18
F S High	34	Robert Collier	58
H S Davis	22	A W Peterson	37
Lt E W Lehman	28	Lt T Stone	31—281
G Lower	33—294		

The Governor's Guard is consequently still the State champion. The Routt Rifles gave notice that they should challenge the winners, and the next match will probably be shot on Memorial Day.

For the handsome rifle presented to Colorado National Guard by Mr. Lower, Companies B, D and E entered. The prize must be won three times consecutively by one company before becoming its property. Although the wind still continued to blow, the shooting was much better than in the first contest, as the following score will show:

Governor's Guards.		Routt Rifles—Co. E.		Company D.	
J N Lower	39—	McGuire	39	Platfoot	29
W A Rice	36—	Kling	29	McCartney	34
Compton	38	Kelly	32	Ed Capps	20
Henderson	30	Schaffer	34	Eugene Capps	28
Marix	38	Sill	23	Falkner	10
Coryell	21	E C Moore	34	Moore	31
High	37	Collier	39	Kingsley	26
Davis	30	Lesley	27	Hogle	10
Lehman	39	A Peterson	37	Jennison	28
G W Lower	32	T Stone	34	Brittling	22
	322		328		268

A FINE SCORE.—The new model Springfield rifle which is to be chanced off by the Wheatley Cadets, Co. D, of Phœnixville, Pa., was sent to E. A. Leopold, of Norristown, Pa., a few days ago, with the request that he test its accuracy at the target. Feb. 21, the weather being favorable, he took it to the Bridgeport range, and in five consecutive shots at 100yds., made the remarkable short string of 4.98 inches. He also put seven consecutive shots in a four-inch bullseye. The shooting was done lying down without artificial rest.

JAMESTOWN, N. Y., March 1.—Regular medal match of C. S. A. yesterday, Creedmoor target, 200yds., wind heavy at 8 o'clock, light very bright:

G Shattuck	5545455454—46	R H Burns	4434434555—41
O H Lilly	4554544455—45	W H Sprague	3333455444—40
S N Ayres	4544555544—45	W N Goke	5454334354—39
J Haycock	5535534454—43	A F Ward	3423534345—36
A F Warner	4514355444—42	H Briggs	3523534343—35

BOSTON, March 1.—The amateur prize match, at the Mammoth Rifle Gallery, of the last two weeks of February, closed last night, R. Ford winning the first, A. B. Loring the second. Following are the scores made:

R Ford	45 45 46 46—182	J T Stetson	44 44 44 44—176
A B Loring	45 45 45 45—185	A W Rand	45 43 42 42—172
T Lyman	46 44 44 43—177	R E Bellows	44 42 42 42—170

For the month of March three prizes will be put up for amateurs.

NEWARK, N. J.—The fifth match in the tournament of the Newark Rifle Association commence on Monday evening, March 10, at the Plymouth range, clubs shooting in the following order: Plymouth, Domestic, Celluloid, Essex, Warren, Frelinghuysen. The corrected scores of last month are: Frelinghuysen 468, Essex 455, Domestic 438, Celluloid 432, Plymouth 420, Warren 420. The last match will be shot on the Warren range, this closing the season for inside shooting, with the exception of private matches on hand.

A meeting was held on Tuesday evening, Feb. 26, at Roseville Park, and a rifle club was organized, to be known as the Roseville Rifle Association, for out-door shooting. They will have a 100yds. range, which is being fitted up in the park.

BRATTLEBORO, Vt., Feb. 26.—Oak Grove range, Feb. 26.

FIVE-BULLSEYES RIFLE WANTED.—Mechanicsburg, Pa., March 3.—*Editor Forest and Stream:* Where can I get a rifle that will carry up the fifth shot 100yds. to a 4in. bullseye. I have tried the Remington and made four successive bullseyes, but the fifth sank six inches. I have also tried a muzzleloader and made three bulls in five shots. Where does Capt. Stubbs live? I am open for a challenge for the championship.—PHILIP UHLER.

THE PISTOL NUISANCE.—Chicago is not free from the annoyance which follows the sale and use of pocket pistols and revolvers. The *Daily News* of that city has been looking into the matter and adds the following testimony to that already given against the free and easy trading in these wee guns of every description. It says: "The habit of carrying revolvers and pistols, frequently commented on and severely criticized by the newspapers, is a growing one among the youthful and middle-aged population of Chicago. A well-known Madison street dealer in guns and firearms told a reporter for the *Daily News* that the sale of the serviceable kind of pistol, that will 'kill a man every time,' is continually increasing. The 'bulldog' revolver, such as Garfield was shot with, is the most popular. Just after Garfield's assassination a Pittsburg dealer was obliged to send all his clerks and salesmen into the department, and even then he could not meet the demands of his customers. The American manufacturers, moreover, were unable to supply the abnormal demand for these weapons, and the English sources of production were soon exhausted. The awful destructiveness of the 'bulldog' was its chief recommendation to public favor at that time. Men wanted some weapon to practically protect themselves from such wild, deluded beings as Guiteau had proven himself. The danger from such a source was considerable, and a genuine, practical remedy was believed to be in this devastating instrument. In selling a revolver or pistol to any one the dealer is required to record the purchaser's name, age, residence and the purpose for which the weapon is bought. No one under twenty-one years of age is allowed to buy any weapon of defence without a written permission from his parents or guardian of the purchaser, addressed to the dealer or 'to whom it may concern.' The average age of the purchasers of revolvers is between twenty-three and twenty five years. These are mostly young men. Very few women in Chicago either purchase or use revolvers, although many husbands declare that they wish the weapons for their wives to practice with and learn to use with some degree of skill. In case of burglars they hope that their 'better halves' may find it possible to protect themselves. The reasons which many people give the gunsmiths and dealers for investing in firearms are very amusing. One man wants to 'shoot a dog,' another expects to 'take a shot at an army of feline marauders that make night hideous by their dismal howls beneath his latticed window, and the sandbagged individual (who wears one eye in a sling and has so lumpy a forehead that no hat can conceal its lofty baldness), with a firm conviction that no sand-bagger will cross his path alive in the future. This man wants and inquires for something that will shoot a big ball, and he must have it. The costly revolvers with carved pearl handles and silver-plated engraved barrels, are sold mostly to the theatrical profession and the cowboy class of humanity. The prices of this class of weapons run as high as $50, $60 and $100. It is a remarkable fact that they are usually worn by men who wear the broad sombrero of Buffalo Bill style of head, flannel shirts and cowhide boots. The high price is seldom objected to by these men, since the article is perhaps the most valued one in their wardrobes. An ordinance of the city of Chicago provides that no concealed firearms shall be carried by any citizen without a special permit from the city government. It is probably the most grossly and persistently violated ordinance of the much abused statutes of the city."

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

UNKNOWN GUN CLUB.—The regular monthly match at Dexter's, Long Island, Feb. 28. Snowing hard in the forenoon; damp and a strong westerly wind blowing in the afternoon. Twenty-eight members shot for three regular and three extra prizes; 7 birds, handicap rise. 80yds. boundary, one barrel, gun below the elbow near the hip, club rule and classified. Of the regular prizes, Knebel and Pope divided first; Vogelsang, Van Staden, Schweinler and Plate second; Smith, Appel, Marlborough, Tomford, Midmer, Moller, Gref and Detlefsen having tied for third prize, shot off under the rule, miss and out. It being near dark at the time, after one round the result was: Smith, Marlborough, Midmer and Detlefsen, having each killed a bird they divided third prize. The birds were a fine lot and very strong fliers. Some of the best shots found hard work to stop them. There will be two more shoots to decide who will be the lucky ones for the three extra prizes, the scores in the three regular monthly matches (February, March and April) to count best two scores out of three, with a proviso that all those who kill 12, 13 or 14 birds in two out of three shoots are to shoot off or divide first prize; 9, 10 or 11 birds second prize; 6, 7 or 8 birds third prize. This is a very liberal plan and gives the poor shots a chance to come in for a prize. Two members having resigned, their places were filled on the grounds, keeping the club up to its limit, 50 in number, with a dozen applicants ready to come in at the first chance.—H. K.

CHAMPIONSHIP OF AMERICA.—Louisville Sportsmen's Association, Louisville, Ky., Feb. 20.—*Editor Forest and Stream:* At our annual tournament to be given about the 1st of June next, and to continue seven days, we propose to give a larger purse than was ever given in this country. We shall call the stake the "Louisville Sportsmen's Association cup, for the championship of America." Our proposition is to secure one hundred entries, before the first day of June at $50 each. All entries must be accompanied by a forfeit of $3. This match is to be as follows: 50 live birds to each entry, 15 at 26yds. plunge traps; 15 at 30yds. ground traps, English rules; 10 pair at 21yds. plunge trap, our rules. The entrance fee includes the cost of birds. As you will observe the purse will amount to $5,000, and to this the association will add a cup referred to above, valued at $250, to be presented to the gentleman making the best score in this match. The net money in the match, $3,350 will be divided as follows: 25 per cent. to the first $812.50, 18 per cent. to the second $585, 14 per cent. to the third $455, 12 per cent. to fourth $390, 10 per cent. to fifth $325, 8 per cent. to sixth $260, 7 per cent. to seventh $227.50, 6 per cent. to eighth $195. Should any entry be made and the party entering is unable to attend, he may nominate some one to shoot in his stead. But no one person will be permitted to shoot two scores. A substitute must be named the day previous to this match. Any person is privileged to enter another to shoot for him.—J. M. BARBOUR, President.

BOSTON GUN CLUB.—The Boston Gun Club opened its fourth grand tournament on its grounds at Wellington yesterday, to continue on each alternate Wednesday as follows: March 5 and 19, April 2, 16 and 30, and May 14. The principal event of these days will be the New England clay-pigeon, three men team badge championship match. The Boston Gun Club will give a solid gold medal of the value of $50 to the club getting the best aggregate of two scores out of the above shoots. Conditions—a team to consist of three men from any organized club in the New England States, each club entitled to send two teams, scores to consist of five singles from five separate and constantly repigeoned traps, three pair doubles from two traps, and ten single birds from a constantly altered trap, each team's score to be thus: Sixty-three birds, singles to be shot from eighteen yards rise, doubles fifteen yards rise, ties each day to be shot at one pair doubles and one single straightaway bird, meaning nine birds per team. If any tie exist on the total of two best scores the teams shall shoot off at five straightaway birds and three pair doubles, or thirty-three birds per team. Entrance, $1 per man, the money on each day to be divided, 50, 35 and 15 per cent. to the clubs in usual rotation. One man can be changed if by sickness or inability to shoot on different days, but no change can be made by members from one team to another of same club. Not less than six teams to constitute a shoot. In addition to these sweepstakes, alternating at fifty cents and $1, entries will be shot.

BROWN'S DRIVING PARK, Long Island, Feb. 20.—Twenty gentlemen assembled to witness the Langley cup match, which should have been shot off in 1883, but was permitted to hold over till February, 1884, by Mr. Langley, who presented the cup to be "fought" for by Messrs. Murray, Nichols, Belmont and Aspinwall. Those interested have heretofore been unable to get the above named gentlemen together. The morning was extremely pleasant though windy, the birds were strong, which called for hard hitting. Among those present was Lord Melton, a widely-known English sportsman. Capt. Stratton was in charge of the traps, Mr. Bruce-Wallis was scorer, Mr. Meredith Cummings referee. Matthew Lyons furnished the pigeons, a wild lot, and his dog Sherry did the retrieving. Conditions: 25 birds each, 5 traps, 5yds. apart, handicap rise, 80yds. boundry, 1¾ ounces shot, American-Hurlingham rules. Mr. Allan Nichols killed 25, Mr. Foster Murray 23, Mr. Warren Aspinwall 23, and Mr. H. Belmont 22. In shooting off the tie Mr. Aspinwall killed seven birds straight, Mr. Murray missing his seventh and taking third place.

MALDEN GUN CLUB.—Some seventy-five lovers of the shotgun assembled at the cosy quarters of the Malden Gun Club in Wellington, March 1, and participated in matches, with the following result:

First match—Henry first, Stark second, Adams and Nichols third, Allen fourth.

Second match—Henry first, Johnson and Allen second, Adams and Field third, Nichols fourth.

Third match—De Rochmont and Stark first, Allen and Johnson second, Law third, Nichols fourth.

Fourth match—Stark first, Eager second, Henry third, Field fourth.

Fifth match—Eager first, Johnson and Stark second, Henry and Field third, Nichols fourth.

Sixth match—Johnson and Law first, Henry and Stark second, Adams third, Allen and Field fourth.

Seventh match—Law first, Eager second, Henry and Stark third Dill fourth.

Eighth match—Johnson first, Adams second, Stark third, Law fourth.

Ninth match—De Rochmont first, Law second, Dill and Hopkins third, Cutting, Field and Adams fourth.

Tenth match—Stark and Law first, Johnson second, Henry, Hopkins and Purington third, Locke fourth.

Eleventh match—Law and Stark first, Dill and Eager second, Field third, Brown and Henry fourth.

Twelfth match—Eager first, Dickey and Stark second, Johnson third, Locke and Adams fourth.

Thirteenth match—Dickey and Eager first, Henry second, Sawyer and Stark third, Purington fourth.

Fourteenth match—De Rochmont and Eager first, Stark and Sawyer second, Law and Cutting third, Dickey fourth.

Fifth match—Miss and out, divided by Henry and Law.

BETHEL, Me., March 2.—Wednesday evening, Feb. 27, the Bethel Shooting Club had a rousing good meeting at Major Lovejoy's, and the following officers were elected for the ensuing year: President, W. E. Shillings; Vice-President, C. M. Wormwell; Secretary, G. R. Wiley; Treasurer, Fred Clark; Executive Committee, Enoch Foster, Jr., John Chapman, Seth Walker, Charley Johnson, S. F. Gibson. About thirty new members were taken in, and now as we have two new clay-pigeon traps and a good amount of cash in the treasury, it gives the boys a hearty feeling to begin work at once, so as to prepare a team to enter for the valuable badge presented to the Williard Club of Portland, which is to be competed for by the several clubs throughout the State. By the way the boys scored the other day they will be hard to beat.—MAJOR LOVEJOY.

THE CLAY TOURNAMENT.—Cincinnati, O., Feb. 25.—*Editor Forest and Stream:* Permit us to inform your numerous readers that the main reason why clubs should enter now by remitting us $100 initial entrance money for the championship match at First International Clay-Pigeon Tournament, May 20-31, 1884, is this: That we expect shortly to make an application to the general passenger agents at Chicago for reduced railroad rates from all parts of the country, and it will materially assist us in effecting this if we can present a large list of clubs who expect to attend.—THE LIGOWSKY C. P. CO.

SPRINGFIELD SHOOTING CLUB.—Programme, March 1, 1884.—Individual State championship glass-ball match between W. S. Perry, of Worcester, and "B. Moses," of Springfield.

Perry	1111111011101111011111111101111111111111111111111110—43
"Moses"	1111111111101100111111111110101111111111101110011—42

Large attendance of spectators; good shooting; sweepstakes.

Yachting.

FIXTURES.

May 24.—Oswego Y. C., Opening Cruise.
May 24.—Boston Y. C., Opening Cruise.
May 30.—Knickerbocker Y. C., Spring Matches.
May 31.—Boston Y.C., First Match, Connor and Commodore's cups.
June 10.—Atlantic Y. C., Annual Match.
June 12.—New York Y. C., Annual Matches.
June 14.—Hull Y. C., Club Meet.
June 16.—East River Y. C., Annual Matches.
June 28.—Boston Y. C., Ladies' Day.
July 9.—Beverly Y. C., Marblehead, First Championship.
July 12.—Hull Y. C., Club Meet.
July 12.—Boston Y. C., Second Club Match.
July 26.—Beverly Y. C., Nahant, Second Championship.
Aug. 9.—Hull Y. C., Club Meet.
Aug. 9.—Boston Y. C., Open Matches, all clubs.
Aug. 16.—Beverly Y. C., Swampscott, Third Championship.
Aug. 23.—Beverly Y. C., Marblehead, Open Matches.
Aug. 23.—Boston Y. C., Third Club Match.
Sept. 6.—Beverly Y. C., Marblehead, Special Matches.
Sept. 13.—Hull Y. C., Club Meet.
Sept. 13.—Boston Y. C., Second Ladies' Day.

SMALL YACHTS IN THE CHICAGO Y. C.

THIS live club is animated with a laudable desire to promote sport in all its phases. Corinthians being still scarce on the fresh water high seas, it is proposed to force their education by special encouragement of "small safe boats." No more commendable course could be advised. Small yachts, if more than open sailing traps, afford all the sport and solid benefits to be expected from larger vessels and at a fraction of the cost. The way to popularize yachting is to invest small boats with the dignity of equal recognition, as there are hundred candidates thirsting for the nautical flame who can afford the time and funds for crewless vessels to every one who can commission a big schooner. And to the hundreds every club ought to look for numerous accessions to the band of sailor yachtsmen. "Only a little boat" was once an expression of mild scorn, but it is becoming understood that a smart man with a smart boat is worth more to himself and the community than the most pretentious vessel in respect to tonnage. Any person's money will buy a large yacht and hire the required crew, but it takes brains to conceive a well-planned little knock-about cruiser and spunk with manliness in mind and body to skipper her with success. To start the fashion in Chicago, we should recommend a design similar to those which have appeared in this journal. Next week we hope to produce another very suitable craft.

Perhaps the club might advance the funds for a couple of trial yachts, allowing members to hire them by the day with limitations, giving all hands a chance. Should any one develop fancy enough for such sailing, he could purchase the boat at cost, the club replacing her by another if advisable. This would lead off faster than waiting for individual action. We can promise those in Chicago, that when the small yacht shall have been once fairly tried, she will become a popular institution and help along the good cause on the Lakes with rapid strides. Mr. Miles G. Nixon recently read an entertaining paper before the club, with a good word for sail area measurement and a start to one gun to increase the smartness and interest in the races. The same gentleman also spoke in favor of classes without time allowance, a most excellent idea. Only the question at once arises, how are those classes to be determined, by what sort of measurement? That brings us back to the necessity of first settling some just basis of comparison, without which no equitable division into classes can be suggested.

One advantage in respect to small yachts, is the facility of finding purchasers for small tonnage, and the many new designs undertaken in consequence to supply the places of boats sold. The building of a dozen small yachts affords just twelve times as many chances for experiment and trial of variations and new ideas, as the building of a single large yacht. Life and progress with rapid evolution are the distinguishing traits of a club recognizing small yachts, while stagnation of ideas and conservative sloth follow in the wake of large, unwieldy and long-time investments, affording less opportunity for change. The beau-ideal of a yacht club is a Corinthian concern with a fleet of two hundred cutters from one to ten tons. If the Chicago Y. C. can bring about, by well directed fostering care, a flourishing squadron of the kind, it will not have lived in vain, though large yachts continue to receive a goodly share of attention and appropriations from the club funds.

Realizing from our own experience pretty much all over the yachting world, that the zest and spirit of the sport lies in the furtherance of a taste for small boat sailing, we have made the subject a matter

of prominence in these columns, and hope our contemporaries who look to us for their cue will lend what aid they can to put the small decked cruiser with fixed ballast upon the plane of appreciation she ought to occupy in America, as she already does abroad. No more suitable waters for small cutters exist than the chain of lakes on our northern border. The short jump which quickly makes and the necessity of putting to sea for a cruise, are certain to demonstrate before long the special adaptability of decked boats of good weight in opposition to light drafts of unsteady behavior, and devoid of ability in troubled waters. The Chicago Y. C. proposes regular matches every two weeks, and will not be slow to offer purses or trophies to attract competition. A shipkeeper and suitable harbor will be found, so that it only remains for some one to start the ball with a two or three ton cutter, aboard of which live individuals can catch the sailing fever, which never releases its clutches in a lifetime.

THE RATIONAL VIEW OF IT.

THE following we quote from an interview with Mr. A. Cary Smith recently published in the *Herald*. It is the most sensible view of affairs we have seen in print, and coincides with the progressive spirit of the day inaugurated through these columns:

"Many, or in fact all the improvements in yacht building can be placed to the credit of the younger generation of yachtsmen. Veterans of the sport, on the contrary, have frequently stood shoulder to shoulder against any departure from the time-honored methods of the olden times, and too often decried the universal right of judicious experiment. To my mind great improvements in yachts will be made in the next few years. Even now yacht designing is being recognized as a profession. The tendency of the day is toward specialties, and the result will be for the better. The desire for extended cruises is growing every day, and an improved type of boat will, of necessity, be built. Every yachtsman cannot afford to build and sail a craft 100 feet on the water line, so that smaller boats must be constructed able to cope with any kind of weather. It will not be long before our coast is made a cruising ground for yachts, even as is the coast of England. The nation is fast growing wealthy, and yachting will keep pace with our prosperity. The size of a yacht in the near future will have but little to do with the length of a cruise. Two years ago, while the fleet of the New York Club was at the eastward, the weather began to look dirty, and a signal was made to return to anchorage. One of the boats that kept on to the last was only 26ft. 6in. on the water line; but of course she was a deep craft, with weight on the keel—the only kind of boat that can be depended upon in bad weather."

THE NEW ENGLAND Y. A.

THERE is a general disposition to adopt loadline length as the standard for measurement in all classes in Eastern circles. So let it be. This must be understood. If length is a fair criterion of relative performance, the consequences must be accepted in all cases without reservation. Animated only by a sense of justice to every craft, FOREST AND STREAM has urged with all its force and logic the adoption of a bulk rule, to force large cutters on a length to pay as they ought to lighter and smaller sloops, sharpies, dugouts and the like. But in refusing to accord recognition to views based upon equity, as we have sought to explain, and in setting up a length rule, the yachting community must be prepared to shoulder full responsibility for what may happen. When a big, powerful cutter thrashes a light and smaller sloop in a breeze and a lop, when she twists away from her in light airs on account of her weight, there must be no backsliding, no childish, whimpering excuses, and no attempt to shirk the decision of a race by pointing to the cutter's big displacement and draft as an advantage not taxed. Either the length rule is equitable or it is not. If not it should not be set up as a standard of comparison. If set up and accepted, the big boat has a right to her bigness, and the little boat cannot complain under any pretext. The "simplicity" of the length rule is quite likely to lead to its adoption. Having done our full duty in defending the small sloop against the encroachments of large cutters, we herewith wash our hands of the whole business and will permit affairs to take their own course. Let no one say FOREST AND STREAM was ever untrue to justice to the sloop, for it was the sloop's battle we have been fighting in seeking the furtherance of the bulk rule, though little-brained chatterers failed to grasp the trend and course of our arguments. When length for length the large vessel wins, it is without the province of length measurement logic to ascribe the score to aught but equity. It will be too late then to put about in search of restrictions to save the light displacements from extinction. All hands once agreed upon length, they must swallow their own medicine, sour as the dose will undoubtedly be. When the deep draft, with her low lead weights and wadding big rig lords it over her smaller sisters and drives them out of existence under the length rule, she does so upon her merits (in the light of that rule). It is well. Now for cutters with unheard-of displacement, greater draft than ever before, tremendous lead keels and swinging, sky-scraping rigs, and woe to the puny traps who may tackle the giants because they happen to be of like length! The light of the small, handy, economical boat has gone out. Brute force is the cue to the model of the future. The biggest, the deepest, the most expensive on the length, and none other need apply. The star of the mammoth cutter has risen and the last faint ray of hope for the light displacement has flickered out its life. And it is very, very rough on the sharpie and soap boxes.

Length let it be. All hail length measurement then. All hail to big displacement. Thrice hail to the modern cutter!

The flounder-bottom sloop with her board and light displacement has been strangled. Choked by her own nurse, so short-sighted that poison has been administered while the weakling has been crying for pap.

Now for the biggest kind of cutters on the length, with the deepest kind of keels and the biggest lumps of lead hung in the lowest possible way. The good patriot's slab with a board, skimming "over the water" is dead. The work of reform is nearing completion. We are happy.

A GENERAL TOPIC.

Editor Forest and Stream:

In reply to your editorial comments upon my communication, published in your last issue, I will take up the matter in the order taken by you. As to weight in light airs, "experience has settled" that when the sea is heavier than the wind and sloops "slat" it out of their sails, cutters have an advantage in their depth, which prevents them from rolling so much, and consequently they hold the wind better and keep their headway. Upon these terms they have beaten the sloop in light winds; but given a day when the sea was quiet, and the result has always been to the credit of the lighter vessel, as all logic must admit, that the less resistance in weight or anything else must obtain superior speed. You say "to make a sloop a good sloop she must be turned into a cutter. She should have only four beams, like the great majority of cutters. She should have the depth, and rig, and sheer, and straight side of a cutter." To the best of my information the great majority of cutters average at least five beams, and racing cutters on the other side, that I have seen have, very frequently, fully six beams. The Bedouin, which is one of the broadest here, has 5½ beams, so I fail to find any warrant for your assertion of four beams.

As to depth, I would advocate some, certainly, but by no means the extreme; rig for a sloop could incorporate some of the cutter's best points, as suggested before, without having the doublings in the middle of the mast, or the mainsail loose on the foot, which are both objectionable for many reasons. As to sheer, the less of that the better for either class. From this resumé I fail to see that I have advocated going "about nine-tenths of the whole thing at a bound." That a sloop may have all that I suggest and still be a sloop, I must still maintain. No yacht of any class with ten or twelve feet of fixed draft could anchor within hailing distance of shore in twenty yacht-frequented harbors that I can name, while eight feet of water can be obtained in the great majority of them. As to "finding fault with the Gracie's model," the evils I noted were known and remedied by Captain Phil. Ellsworth in all his models long before cutters came here to instruct us in yacht designing. While admitting that the Gracie is the "queen of the fleet in America," I still contend that she is so through superior size only; that a vessel of the same dimensions, designed, built and rigged as I suggested in my last, would give her time in any kind of weather. That the Bennett champion cup was won by Bedouin in "our weather and our waters" is quite true, but the result would certainly have been more satisfactory to every one if both competitors could have had some wind at the same time.

The chances of adding victories to the cutter's side would certainly be increased by a large fleet from which to select a champion, and the absence of a number to choose from is exactly the difficulty upon the sloop side. There really isn't a first-class sloop in the country. When Americans have felt like building 80-foot yachts they have invariably built schooners. You say that "in point of cost, the modern beamy sloop of large displacement is more expensive and has a greater draft than the cutter." The Bedouin cost not a cent less than $45,000, and I have heard it estimated even at $50,000; the owner of the Gracie would very cheerfully sell out for half that sum, and any builder in this country would be glad to take a contract to build and fit out complete a sloop or schooner 100ft. long for $40,000, so that I am again compelled to question your claim as regards cost, and as regards draft. I fail to comprehend how an American centerboard can draw anywhere near as much as an English keel. In concluding, you say that, in reference to the Fortuna, "it is one of her good points to lift readily to everything." Now a yacht that lifts to a ten or fifteen foot sea instead of jamming into it and checking her headway is certainly doing well, but that can hardly be said of Fortuna's "lifting" in the Gibraltar cup race, when there was no sea over six feet in height, and when that same "lifting" evidently did more to defeat her than anything else. FRANKLYN BASSFORD.

55 CONCORD STREET, Brooklyn.

[A review of this subject is crowded out till next week.]

MIGNONETTE, CUTTER.

IN placing before the public a series of designs for small yachts, we have been animated with the desire to supply the general reader with accurate information relating to the capabilities of such boats, and above all to disabuse his mind of the prevailing but mistaken notion that yachting and a long purse must needs go hand in hand, and that the sport to be got from small tonnage is necessarily more limited than is to be expected from vessels of considerable size. Two greater falacies could not exist. A very small outlay and a very small boat will realize to the beginner or adept everything contributing to the fullest participation in the enjoyments and benefits of yachting. It is important that this should be thoroughly understood, as the small craft is within the purchasing power and management of hundreds who may never expect or care to make the investment of time and money entailed with the ownership of an unwieldy affair demanding a hired crew. In fact, unless able to devote one's time to cruising all the year round, size in a yacht acts as a damper upon quick and ready ardor, inasmuch as the attainment of the end desired is more distant and indefinite. A large yacht is always a sort of financial millstone about the neck, and represents such a big undertaking in all her doings that she is naturally put to service with hesitation at intervals only; the crew, however, never once ceasing their onslaught upon the grub locker, nor is there any let up to other expenses of commission while idly swinging to an anchor. Of course, the sailing of large yachts has charms and advantages of its own in some respects, but so far as all the essentials of the sport are concerned we know they are at our command on two tons just as well as upon a hundred times two, while the little boat likewise has certain good points of her own as an offset to those of her big sister. The belief to the contrary has a certain basis of justification. It has been but a universal custom in America to model, rig and fit small boats as toys merely, exacting from them more than boys' play, never suspecting the possibilities of which they were really capable, because bidden to first impresions. Our small yachts have not been built as yachts at all, but as makeshifts and machines, flourishing only in a sort of ephemeral afternoon butterfly existence. The possession of sturdy vested qualities characterizing big tonnage has not until recently been contemplated in their planning. With the present development of the sailorizing side of the sport and the practical lessons inculcated through the instrumentality of "cutter ideas," a new field of utility has suddenly opened to the small boat which is being welcomed by the masses, for it offers them a chance to participate in that chapter of yachting from which they have so long considered themselves shut out.

To adapt a small boat to the same ends as a large one and with equal success, it is only necessary to abandon prevailing impressions and to boldly branch out in the directions indicated by experience.

The small boat engaged in active work makes heavy weather of it so much oftener than the large one that it is paramount to incorporate in her scheme the greatest possible power and ability to face whatever may come along. She must for this reason possess the maximum weight on her length. As this cannot be engrafted upon a beamy form, it is a sequence that she should be deep and narrow in proportion. To further add to her ability the weights should be stowed as low as the structure will allow. The boat should possess a keel upon which to hang them. Both of these requisites carry with them the greatest accommodation and safety and moderation in rig. The first due to the absence of a centerboard trunk, good height underneath the beams, with ventilation and light; the second due to a low center of gravity, and the third to fineness of form, it being well established that large displacement on small beam can be more economically driven than less displacement on wide beam. These provisions will insure the three chief virtues a small craft should display—ability, practically available room, safety from capsizing. The fourth essential is speed. Success or failure in this respect will depend upon the proper distribution of the boat's bulk for ready passage through the water and for sail-carrying to be derived from a consideration of both form and the weights. Of secondary importance, but none the less deserving of attention, are such matters as handiness of rig in connection with efficiency, the various requirements of comfort and convenience, and the arrangement of details of equipment. Simplicity throughout should of course be studied, but in no case should simplicity be allowed to overrule adaptability. Such a sacrifice cannot be tolerated. Far better have a surplus of complex contrivances than be unprepared to execute just what ought to be executed under all circumstances likely to arise. It is a grave and common mistake to seek simplicity in all hazards and to sacrifice more important considerations in magnifying the value of simplicity beyond all reason. Simplicity is the easiest thing attainable. A clothes pole, a night shirt, and that irresistible charm to ill-matured conceptions, the "single halliard," are within the comprehension of every one, but of what avail is such a primitive affair, if success in plying to windward is at stake? And a clothes pole without proper staying is simplicity itself, but where is the man of experience who would expect the highest performance with masthead whipping about, and who would choose to buck such poverty-stricken equipment into a steep sea? The green hand may fail to appreciate the issue. Those who "have been there" cannot be inveigled by the claptrap of "simplicity" at the expense of other things worth having.

In the foregoing we have outlined the general principles which must be followed where the most in the way of performance is wanted out of the least in the way of boat. A neglect to acquiesce in these principles established through endless practice, is only to invite failure in proportion to the departure. Innumerable notions have risen to the surface, and every now and then pop up again in some trifling disguise, whereby their promoters seek to evade common laws of nature and the multiplication table. First, it is this or that fisherman's old hulk, then some dugout of a canoe, then a Block Island bouncer, then the sharpie, then some Fiji island importation, and so on, which are in turn held up to admiration as the personification of all that is perfect in naval design. Worshippers more important than ever are never found wanting to take up the cudgels for transparent accidents, which an expert can dissect at once as radically wanting and faulty in some of the principal elements imperative in a small yacht. But the combined science and experience of the civilized professional world is not easily overthrown by the crudities of aboriginals, with whom form and peculiarities in boat building are invariably the merest accident of the immediate surroundings. Limited in wealth, in material or in skill, their boats are makeshifts to cover one or a few special wants. To the well-planned yacht designed to meet a wider range of more exacting contingencies, all these makeshifts must bow in deference to the broader intelligence which calls the modern yacht into being.

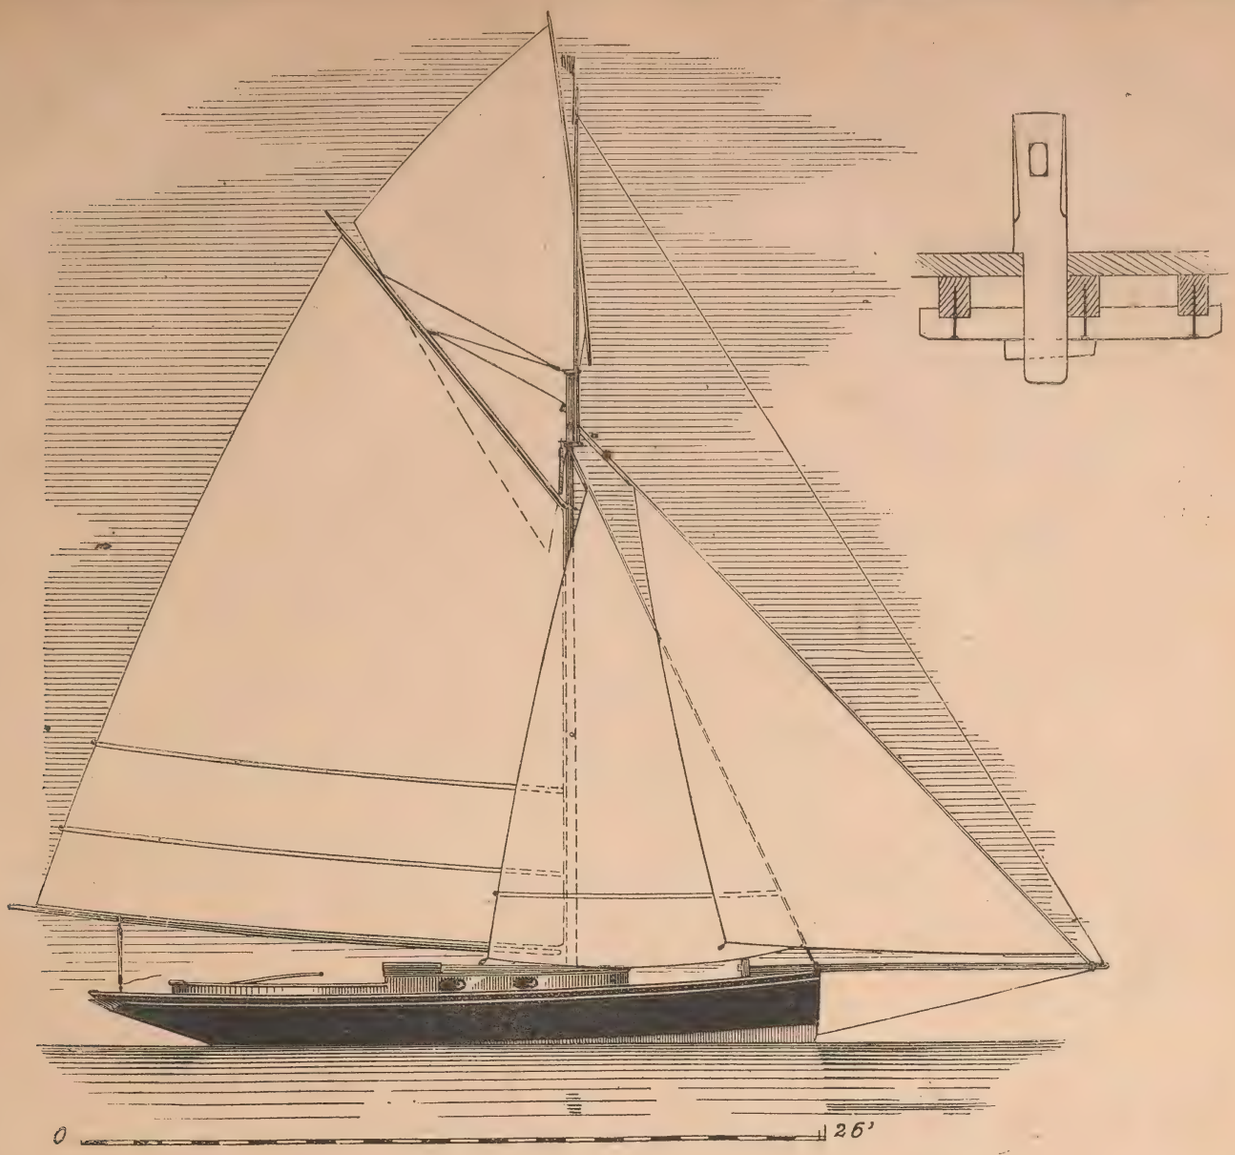
Let no one be deceived. It is impossible to juggle nature. You cannot circumvent her. You must accomplish your aims by calling nature to your aid. You must expect to pay for what you get, and a saving by curtailing the weight upon which you depend for momentum, or the draft to hold you against surface agitation, or the equipment with which you are to do your pointing can only lead to disappointment. A small boat which is not able in lumpy water is worthless for aught but restricted harbor operations, and that is not the kind of boat with which to solve the proposition of "yachting on small tonnage."

When it comes to a matter of model and rig in specific detail, it should not be overlooked that success may be expected from more than one individual design. Indeed within reasonable limits there must always be a variety to choose from, each excelling most in the direction her features are most salient. Thus the narrow and heavy boat will be the ablest driving to windward in rough water. She will heel rather more at the start, but show stiffness in strong breezes; can be crowded more, but calls for smaller rig; will draw more water; have narrower deck, less wings, but more headroom and ends below; will be drier than a shoaler, wider boat; toss less spray; be easier in her rolling, but pitch rather more on account of fine ends and little floor; will be steadier on her helm, hold her way better, show more speed in trifling airs, and, in short, show the distinguishing attributes of a regular cutter on a larger scale.

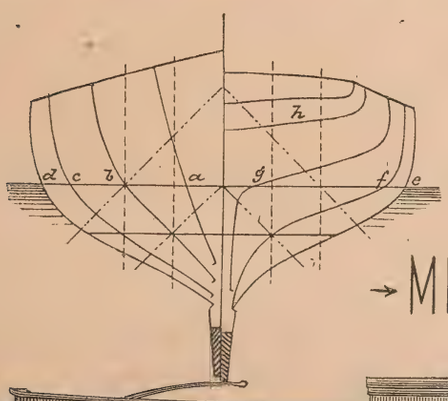
On the other hand, the broader and the lighter of two boats will be stiffer in ordinary winds, have more deck room and wings below, require the larger rig, draw less water, have less headroom, toss rather more spray, be quicker in her rolling, slower in her pitching, harder on her helm, with less ability in a sea, lose way quicker, and, in short, partake of the flat bottom centerboard's qualities to a greater degree than another boat having less beam, greater depth and weight, all of which may be no cause for complaint, if the departure from the trap model has been marked enough to correct her faults to such an extent that we can afford to overlook what remains as of no great consequence.

A boat which appears in every way to answer as an exponent of the last-described class is the new cutter Mignonette, which is illustrated with this article. Stated curtly, she is the product of ingrafting beam enough upon the cutter type to realize the objects for which she is intended—for cruising about the coast between this and Mount Desert, single-handed or with a friend, as occasion demands. Her model is from Keating, of Marblehead, a further modification upon his well-known Carmita toward the cutter, inasmuch as the beam has been clipped, depth and displacement increased, and a regular cutter rig accepted, with the jib set flying on its own luff. She embodies, as a whole and in detail, the well-digested ideas of Dr. E. G. Loring, her owner and projector. Long experience in small boat and yacht-sailing along the coast, and experiments with various styles and rigs have led up to the construction of the Mignonette, and there is little doubt that she will suit his purposes famously and become the first of a large class soon to follow. She has been built in excellent style by Wallin & Gorman, of South Brooklyn, to whom she is a decided credit in her smooth skin and tidy finish about decks. With a 1,500lbs. shoe hung low and a small well the Mignonette is without question uncapsizable, and also "unfillable" in the event of a serious knock down. A judicious apportionment of beam and depth permits 4ft. 8in. under a low house of 12in. height, with a floor of 30in. This with two berths of 24in. width (shown too low in the plans) by 7ft., lockers, shelving, racks, etc., give exceedingly liberal accommodations on the length of 20ft. 10in. The cockpit is peculiar. The floor of the well is 18in. below level of deck and 6 by 3½ft. with 14in. of deck all round utilized for seats, the mahogany coaming being set back from the well that distance. In this way the volume of water which could be shipped is reduced to a harmless amount, and the cabin doorsill is almost at deck height to prevent a sea finding its way below. The overhang supplies a good lead to mainsheet, and increases useful deck area. The rig is that of a full cutter, chosen after experiment with many other kinds. The division of sail puts the yacht within easy control of one hand, who finds himself at all times prepared for anything that may come along. Indeed, the cutter represents a combination in speed and handiness which is not equalled by any other rig under the sun. That it is a fast and close-winded arrangement all know from observation of the races in these and Boston waters. In speed the cutter is second to no rig, and it is probable that no other can really equal it. In handiness it is far superior to the sloop. The Mignonette, for example, strikes into strong wind. She lowers foresail in a jiffy, and has taken off nearly one-fourth the sail plan, equivalent to a double reef in mainsail at a tithe of the trouble and time. Should a squall overtake her, mainsail and jib can be let go by the run, and the boat can still ply to windward under foresail alone. To enable her to do so to some good, the foresail is "hugged" three feet abaft the mast. The owner states that by keeping foreside of mast clear of pins, and pointing the jib band by a bolt passing down flush through lugs, dovetailing lunge fashion, in place of setting up with screw and nut, he finds no trouble in lighting over the sheet when heaving about in stays, and that he finds the long foot foresail a fine pulling sail, a sort of continuation of the mainsail forward the mast, sheets being led to trim very flat. Under all circumstances just the right balance can be preserved through five successive modifications of the sail plan. Thus: All plain lower sail; mainsail and jib; reefed mainsail and small jib, or full foresail; close reefed mainsail and reefed foresail or small jib; and fifth, under foresail only. You can always reef at leisure by keeping on your course with foresail, making more sail as convenient. You can work out of a harbor under foresail and set the reef when clear. The mainboom is but 19ft. long against some 23 or 24 in a sloop. Toe jib is small and easily trimmed. It is run out to bowsprit end on a traveler, and when not wanted is quickly got rid of by a pull on the inhaul and lowering away. In a sea it saves laying out on a light spar to furl, and likewise takes the weight and bunt of the sail out of harm's way. A little dexterity is required in handling the jib lest it get away from you during the operation, and this a little practice speedily teaches. This method also enables you to run jib out or in to a suitable distance to balance the rest of the sail. That there is need for all these accommodations no sailorman needs to be told, but we may say that Dr. Loring has often had occasion when single-handed to go through all these operations, notably in a coarse-weather beat of twenty-two miles on a passage in from the Isles of Shoals. The safety of a shifting jib was vividly brought home to him one day when his brother nearly lost his life trying to reef jib out on the bowsprit in a tumbling sea. On the other hand, no more lubberly and ineffectual way of shortening sail than "bobbing" the jib of a sloop can well be imagined. It involves the loss of control over head sheets, and this no good sailor will view with favor, however much the custom may pertain among green hands, or as a hasty and cheap makeshift among small fishing smacks, engaged principally in smooth water. To be sure the cutter carries with it one more halliard and sheet than the sloop, but as you are not obliged to attend all sails at once the "complexity" in practice amounts to absolutely nothing whatever. You trim jib first, then flatten foresail in the next half minute. But should even this bother a beginner, he may drop foresail for short work in and out of a crowded anchorage. As between the delusive value of simplicity so called and the practical adaptability of a rig, we advise adaptability without hesitation.

The principal specifications of the Mignonette are as follows: Keel, 6x8; stem, sided, 3½; post, 10in., moulded; all of oak, including deadwood. Frames, oak, 1½x3 at heels and 1½x1¾ at head, double, riveted together, boxed into keel, with hackmatack floors bolted through keel. Clamps of oak, 1x3½, full length of boat, as is also all other plank. Deck frame of oak, 1½x2¼, riveted to clamps, with knees to side. Top streaks of oak, 1x3½, with two wales of Georgia pine, rest of 1in. cedar. Planksheer of oak, 1½x3½, whole length; deck of white pine, bright, 1¼ square. Ceiling ¼in. thick, narrow and beaded. Mahogany fittings. Four sidelights to house and two 5in. brass ports in forward end. All ironwork of best galvanized Norway iron; lignum vitæ deadeyes, iron strapped, two shrouds each side. Spars of spruce, three coats of varnish. Patent bouched iron strap, lignum vitæ blocks. Builder to furnish yacht complete with all rigging, gear, anchors, chain, hawser, sails of 10oz. double-bighted cotton duck. Ballast, 2,300lbs. inside and 1,500lbs. on keel.



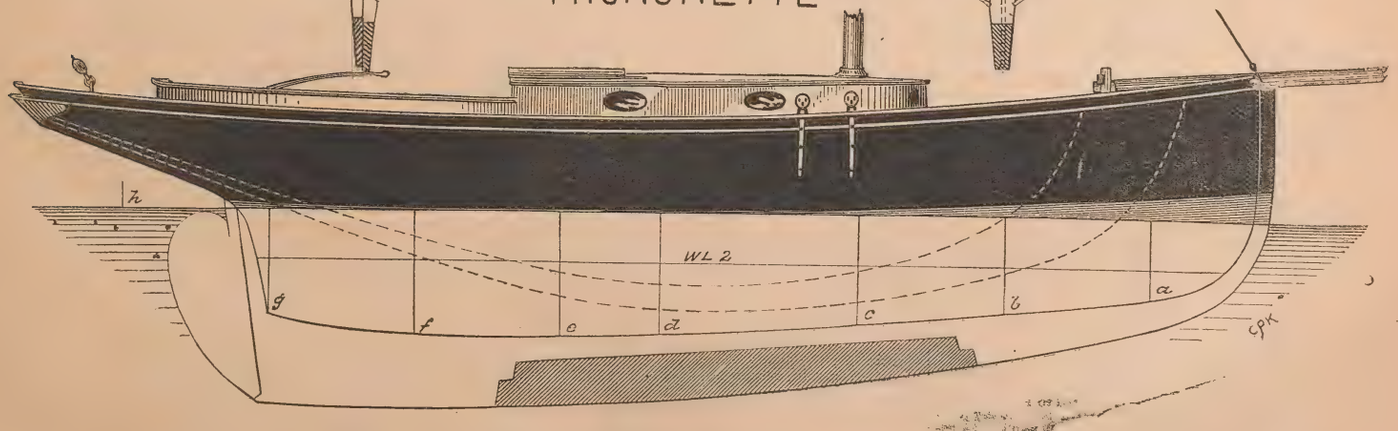
The increase in displacement of the Mignonette over the Carmita we have considered offset by the cabin house deeper throating to floors, and regular cruising outfit and stores to be carried. The ballast and its ratio to displacement would vary of course with the outfit. The manner of keying the locust bitts to the deck to do away with crowding the eyes below is shown in our sketch. A wood knee will in addition be worked on the forward side on deck to further stiffen them.



The sections shown in the plans are not building frames, but the sections by which the boat was laid down. The elements are as under:

	Mignonette.	Carmita.
Length on deck	25ft. 10in.	24ft. 8in.
Length loadline	20ft. 10in.	20ft. 6in.
Greatest beam moulded	7ft. 9in.	7ft. 11in.
Beam on loadline	7ft. 3in.	7ft. 6in.
Depth M. S. planksheer to rabbet	4ft. 2in.	3ft. 11in.
Greatest draft	4ft.	3ft. 7in.
Least freeboard top planksheer	1ft. 9in.	1ft. 7in.
Area immersed M.S. with keel	11.48sq. ft.	10 25sq.ft.
Area loadline plane	105.33sq. ft.	101.20sq. ft
Ratio sq. root M.S. to L.W.L	3.39	3.20
Area longitudinal section with rudder	71.5sq. ft.	62.0sq. ft.
Ratio M.S. to same	0.34	6.05
Area wetted surface with rudder	203sq. ft.	184sq. ft.
Displacement	8,350lbs.	7,735lbs.
Displacement in short tons	4.175 tons.	3.867 tons.
Same per inch at loadline	562lbs.	540lbs.
Wet surface per short ton displacement	10.2sq. ft.	47 6sq. ft.
Ballast inside	2,350lbs.	2,050lbs.
Ballast on keel	1,500lbs.	1,150lbs.
Ratio ballast to displacement	46pr. ct.	48pr. ct.
M.S. from end L.W.L	12ft. 4in.	12ft. 6in.
Center lateral resistance from L.W.L	12ft. 4in.	11ft. 4in.
Center effort of sails from L.W.L	11ft. 8in.	11ft. 4in.
Center of buoyancy from L.W.L	—— ——	11ft. 6in.
Area three lower sails	460sq. ft.	430sq. ft.
Ratio to square of loadline	106 per cent.	102 p. cent.
Sail per sq. ft. wet surface	2.28sq. ft.	2.33sq. ft.
Sail per ton of displacement	110.3sq. ft.	111.2sq. ft.
Area mainsail	279sq. ft.	298sq. ft.
Area lug foresail	91sq. ft.	56sq. ft.
Area large jib	90sq. ft.	76sq. ft
Hoist of mainsail	15ft.	15ft.
Foresail on foot	11ft. 3in.	8ft.
Jib on foot	12ft.	10ft. 6in.
Mast from end L.W.L	8ft. 8in.	7ft. 6in.
Mast from deck to hounds	19ft.	17ft. 6in.
Boom over all	19ft.	18ft.
Gaff over all	12ft.	16ft.
Bowsprit end L.W.L to stay	9ft. 6in.	9ft. 8in.

ARRIVED OUT.—Schooner Montauk made Bermuda in safety Feb. 27, after a very long and bad passage. Distance 800 miles. Time of passage over seven days. Was compelled to heave to sixteen hours, and eleven hours unable to face the sea. The skipper watches her closely to prevent a capsize, and will not buck her at it in a steep sea, which should allay all fears for her safety.



CRUISING.—Steamer Atalanta, Mr. Gould, sailed from Charleston, March 4, bound south. Schooner Fortuna, Mr. Hovey, sailed from Havana, March 4, bound for Bermuda.

A FINE PIECE OF WORK.

Editor Forest and Stream:

I have noticed that in one or two of your published accounts of the cutter ("No. Twelve") building at South Brooklyn, you have connected Mr. Lennox's name with her. Mr. Lennox has nothing to do with her building, and as she is the best yet turned out in this vicinity so far, I think the credit should be given to whom it belongs. She is being built by Daniel C. Bernard in his own shop and yard, and for first-class material and fine workmanship she is way ahead of the ordinary yacht building in these parts. F. B.

[We can indorse the foregoing. The workmanship about the Merlin is almost carried to the pitch of a fine art. She is the best job turned out in these parts, and promises likewise to be a brilliant success in respect to her planning and design.]

A YACHT OF GREAT INTEREST.—Mr. E. G. Weld's new yacht now building by Smith, of South Boston, will afford some very instructive comparisons when sailed against the Hera, belonging to the same owner. The new yacht is of the same length about, but narrower, deeper, and of larger displacement. Hera is 35ft. loadline, 13½ft. beam, and 7ft. 4in. draft. The new boat is 36ft. loadline, 11ft. 11in. extreme beam and 8ft. draft, with no less than 7 tons lead on her keel. She will have a flush deck, and is built, we believe, mainly with a view to accurately test large displacement on less beam for racing under length measurement. The frame, according to the Boston *Herald*, is steam bent, moulded 8½in. at heel, and 2½ at head, spaced 15in., and sided 2½. She will be through copper fastened with 1¼in. planking. Incidentally, it may be remarked, that the draft of the new Hera on 36ft. length is as great as that of the English cutter Maggie on 45ft. loadline, and 6in. greater than that of the Scotch cutter Madge of 38ft. loadline. In the East, the bugbear of draft has been dissipated, and the length rule boats already draw more than and displace as much as cutters of same loadline. The displacement of the new Hera is about 14 tons on 36ft., and that of the cutter Madge is 16½ tons on 38ft.

STEERING VERY WIDE.—The *Herald* put a green hand at the bellows last Friday, and sent him on a cruise to Bay Ridge, that holy of holies, the last spot where the sloop still doth flourish, though even there in a modified form. Dr. Barron is graciously patted on the back for his lynx-like discernment in building a centerboard, which, considering that Dr. Barron was within a few hundred dollars of buying the cutter Wenonah, and that his new sloop is described as 8ft. deep in place of the 5½ft. which was the regulation allowance of ye olden time trap, must be very amusing to Dr. Barron. Then we are told the Oriva is 51ft. instead of 50, to mislead the public in possible future races between the two boats, and to cap the climax, the fine little cutter illustrated in our issue this week, is described as a centerboard of Block Island model, with a long overhang! Somebody has been making a fearful guy of the *Herald*, but we suppose that sort of stuff is just the kind of stuff expected from such a source. Are we never going to have any one on the daily press who can tell one end of a boat from the other?

SEAWANHAKA CORINTHIAN Y. C.—The club book to appear May 1 will show a fleet of over 100 vessels and a large increase of membership. The club has the finest fleet of cutters in America. From one or two straggling yachts of that sort they have increased and multiplied into a squadron in less than four years, and more are being added right along. Affairs were never in a more flourishing condition, and the S.C.Y.C. is now the most sporting organization in New York, a combination of the leading and most progressive spirits in the amateur sailing world. It is said with truth that the club contains more gentlemen capable of designing and building as well as sailing their yachts and deserving to rank as experts than any other club in America or abroad. It is a yachtsmen's club and not merely a collection of yacht owners.

COUNTERFEITS.—When a person cannot command his own English, but steals whole sentences from others, he is at once convicted of being a plagiarist, having no brains of his own. We do not object to the frightful rubbish printed in an alleged newspaper over the grandiloquent signature of "America." The illogical stuff carries its own answer. But we do dislike to see such an incapable pretender draw sustenance by appropriating our language, which has a strength of its own easily recognized in the worst hodge podge. But, we suppose, such is fame. You have to furnish the enemy with powder to shoot, or there would be no enemy to knock over when occasion arrives for giving him the dignity of that much recognition.

PLAY SOLDIERS.—We learn from the *Sun* that the S. S. Utowana belongs to Captain Connor and the S. S. Promise to Captain Cordova. Do these gentlemen, guilelessly innocent of everything appertaining to a captain, dress up in tin swords, pasteboard chapeaux and paper cockades, that the *Sun* should confound a stockbroker with a "captain?" It is time the newspapers stopped such sickly slobber. Neither Mr. Connor nor Mr. Cordova are "captings." They are yacht owners.

BEVERLY Y. C.—The fixtures of the club will be found at the head of these columns. The club has adopted the one gun start for all but the open match in August.

Canoeing.

FIXTURES.

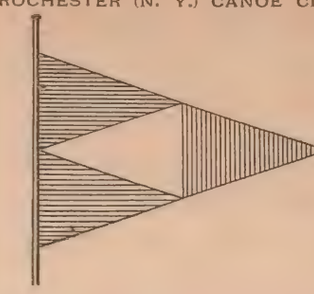
Winter Camp-fire.—Wednesday, March 12, 8 P. M., No. 23 East Fourteenth street, Kit Kat Club Room. Subject—Tents and Camp Outfits.

Secretaries of canoe clubs are requested to send to Forest and Stream their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to Forest and Stream their addresses, with logs of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

CANOE vs. SNEAKBOX.

Editor Forest and Stream:

I am decidedly of opinion that a well-constructed sneakbox will drown out any canoe that ever floated. This is based on several years' experience with both. The sneakbox possesses the further advantage of permitting you to take one or more friends with you. The handsomest and lightest sneakboxes are probably made by Rushton. They are likewise the most expensive. For a heavier, rougher built and much cheaper box of better model, communicate with J. F. Kilpatrick, Barnegat, N. J. Four years ago he built one for me, 16x3, and the following year one for a friend 18x3½. Both have given excellent satisfaction. These boats are wonderfully able, it being almost impossible to upset them unless the sheet fouls in a hard blow or squall. For speed my box will hold its own with the average catboat of same length sailing on the wind. Before the wind the catboat will beat it. I carry a fair amount of sail (balance lug) as seen in accompanying photos. Have never reefed but twice, and then because the crew were ladies. I usually spend three months each year at the waterside, and would be pleased to have Mr. Neidé visit the Sound, Connecticut shore, with his Pearl during a stiff southeaster. The sneakbox is pre-eminently the boat for boys in which to gain their first experience. Good also for inland lakes where winds are flawy, and the balance lug the best rig. Bojum.



Editor Forest and Stream:

The one objection I've always entertained to canoe meets in general is that so much of their programme is devoted to racing. I am only a solitary cruising canoeist, and as such must stick to my principles and decline Dr. Neidé's friendly challenge to match the sneakbox against a canoe. I stick to my opinion, however, that the sneakbox is far more seaworthy in wide waters than the canoe. If my declension to race looks like inability to prove what I assert, so be it. I'm not on the race. Seneca.

Washington, March 3, 1884.

[The present owner of "Bojum's" old canoe, after more than 2,000 miles cruising in her, has this season taken to the sneak box for one of the reasons given by "Bojum," that a large boat will hold more than a small one, but after thoroughly testing the box, he declares for the canoe as a cruising boat. Of course, a boat of 18x5½ft. is larger and should carry more, sail faster and be stiffer than one of 14x2½ft., but to compare the models, boats of about the same size should be taken. It is but fair to the canoe in question to mention that her reputation for stability has greatly improved since the change of owners. If "Seneca" will visit any of the canoe meets he will find that the racing is confined almost exclusively to well-known cruising canoeists, and to canoes that have cruising records of hundreds of miles. Of course, the only test of the merits of the boats is by racing or cruising together, and a little wind and water will settle the question much more conclusively than ink and paper.]

ROCHESTER (N. Y.) CANOE CLUB.

Rochester, N. Y.—Organized Sept. 22, 1882. George H. Harris, Commodore; F. W. Storms, Vice-Commodore. Matt Angle, Purser. Fifteen members. Signal, pointed burgee, composed of four triangles; the two at base blue, center white, apex red.

AMATEUR CANOE BUILDING.

Ninth Paper.

BUILDING—CONTINUED.

Before removing the staff from the moulds, the position of each mould must be marked on it, as the breadths will be laid off afterward at each mould.

A board is now selected free from knots, sap or checks for the garboard. If it can be had planed to the thickness, ¼in., much trouble will be avoided, but where this is not possible, a board ⅜ or 1in. thick is planed smooth on both sides, the staff is taken carefully from the moulds, laid on it and held by a few tacks, then with the compasses still set to the same distance, the measurements are reversed, placing a point of the compasses on the marks on the staff, and measuring out on the board. This operation, if accurately performed, will give the exact shape of the lower edge of the garboard.

The sirmark is now transferred to the board, and also the position of the moulds, after which the staff is removed and a batten is run through the spots, the curves on the ends being drawn in with the rabbet moulds. To lay off the upper edge, the breadths on the stem, stern and each mould, as previously marked off, are taken and transferred to the respective points on the board, an extra width of ⅜in. being added for the lap, and a line drawn through them with a batten.

Some woods, cedar and oak especially, will spring or change their shape when a strip is sawed off one edge, and if this happens, the shape may be so altered that it will be very difficult to make the plank fit. If a straight line is drawn down the center of the board before sawing, and then tested, after one edge is sawn to shape, it will show whether the plank has sprung at all, and if it has, a strip should be sawn off the other edge, leaving the board still a little wider than the finished strake will be, and then the board should be laid off anew from the staff, as in the first instance, after which the edges may be planed up, with little danger of further springing.

If the board is thick enough to make two strakes, gauge lines are now run around the edges ⅛in. from each side, the piece is laid on the saw benches, one end wedged fast between the two upright pieces previously mentioned, and it is sawn through, using the rip saw held nearly vertical, a few inches being sawn from one edge, then the piece being turned over and sawn for a short distance from the other edge, this process being repeated until the sawing is finished, as the saw will certainly run if used entirely from one side.

When the board is sawn in two, the pieces are each planed to thickness on the inside, after which the edges must be beveled to fit the rabbet. The best bevel for this purpose is made of two pieces of wood ⅜in. wide and 1½in. long, one piece, ¼in. thick, having a saw cut in one end, in which the other piece, 7/16in. thick, is slipped. The bevel is applied to different points of the rabbet about 6in. apart in succession, and the angles transferred to the respective points on the strake, after which the entire edge is planed to correspond to these spots.

The second or broad strake will, of course, lap over the first, but at the ends the laps must diminish until the surface of both planks is flush with the stem at the rabbet. To secure this the adjoining surfaces of both are beveled off, beginning about 18in. from each end and increasing in depth until about half is taken from each piece at the rabbet of stem and stern. This may be done with a rabbet plane or sharp chisel. The lower edge of the broad strake is left 7/16in. thick, a rabbet being cut in the garboard to receive it, but the upper edge of the garboard is simply planed to a feather edge. Before cutting this rabbet the width of the lap, ⅜in., should be marked with a scratch gauge on the outside of the garboard as a guide for setting the next plank.

All being ready, the garboard is now held in place, with the help of an assistant, each part of it being tried in the rabbet, to test the accuracy of the bevels. In doing this, the plank is not put in place for its entire length at once, but one end is tried, then the middle, and finally the other end.

The fitting being complete, the stop waters in, and the hole bored for the centerboard bolt, if any; the garboard is fitted in place on the fore end, adjusted by the sirmark, the after part being held well up by an assistant, and one or more clamps are put on to hold it, then holes are bored and countersunk for the screws, which will be ⅜in. No. 5 brass, and the garboard is screwed fast as far as it lies in place.

In fastening such light plank, great care is needed to avoid splitting it; the pieces must be in contact before the screw or nail is put in, otherwise, if it is attempted to draw them together with the screws, the plank will usually split. Screws are only used at the extreme ends, where nails cannot be driven through and riveted, but along the keel the latter are put in. After the fore end is fastened, the plank is laid in place along the middle of the boat and nailed, every other nail being omitted to be put in after the timbers are in place, after which the stern is screwed fast.

If the operations described have been carried out correctly, the garboard should fit exactly without any further cutting, and the greatest care should be taken to do so, as if the strake does not fit at first, it is very difficult to make it do so by cutting it afterward. When both garboards are on, a spiling is taken for the broad strake; it is got out and put on in a similar manner, the staff, however, in this case being in one length. After the strake is in place and screwed at the fore end, it is fastened with clamps, and the positions of the nails, omitting all that will pass through the timbers, are marked off, using a thin batten bent around the boat, from the marks on the keel to those on the ribband, to insure the rows of nails being straight.

The nails for this work are of copper, ¾ or 1in. long. As the holes for them are bored, they may sometimes refuse to hold at first, in which case a block of soft wood, 1in. square, is held inside the seam and the nail driven into it, the block being removed before riveting. It may sometimes be necessary to drive a nail through the plank into a mould, using a hutchock to hold the plank down, but this should be avoided if possible, as the hole will have to be plugged afterward.

To recapitulate, the process of preparing and placing a plank is as follows: First, to set the staff, mark it and take the spiling with the compasses, mark positions of moulds, plane both sides of board, remove staff, place it on board, nail it, spile off on the board, mark position of moulds on latter, remove staff, mark line of lower edge through the spots, lay off breadths at each mould on plank, leaving ⅝ extra for lap, line upper edge through these spots, saw out, plane up edges (if a thick plank, gauge edges, slit and plane insides), bevel edges, gauge upper edge on outside for lap, cut rabbets at each end for next plank (on the bilge it will be necessary to bevel the upper edge of plank on outside for its entire length), put in place, clamp, screw fore end in rabbet, nail along lap, and cut and screw after end.

Where there is a quick turn to the bilge, it is best to use ⅛in. stuff for each plank, hollowing the inside with a plane, and rounding the outside to fit the curve of the moulds. At the ends, where the laps are thinned down, tacks, ¾ and ⅝in. long, are used instead of nails.

The planking being completed, the canoe, if built with the keel up, is turned over on the stocks and shored in position, the keel being blocked to the proper rocker, then the ribs or timbers are sawed out of a piece of stave timber, ⅝x¾in., the upper corners are rounded off, and if not flexible enough to bend easily, they are put in the steam box or laid in boiling water.

The holes for the nails are now marked off by means of a wide, thin batten, which is bent into the bottom of the boat and adjusted to the mark on keel, and also so that it stands upright; then a mark is made where it crosses each lap, and a hole bored in the middle of the lap with a 7/16in. German bit. When all the holes are bored, the ribs are taken one by one, bent over the knee and pressed down into the bottom of the boat; then the nails, which have previously been driven lightly into the holes, are driven up through the timber, using a set to hold on the top of latter alongside of the nail as it comes through. The lowest nail must always be driven first, then the others in succession from keel to gunwale.

As many ribs as possible should be put in before the moulds are removed, those alongside of the bulkheads, however, being omitted entirely. A nail must be put through the middle of the garboard and broad into each timber. After all are in, the boat is kept from spreading by means of cross spalls, pieces holding the gunwales together, and the moulds are removed; the blocks are then pulled off the ends of the nails, and the riveting up begins.

A copper burr or washer is slipped over a nail and driven home with a burr starter, an attendant outside holding the set on the head of the nail. When the burr is on, the end of the nail is cut off close to it, and the projecting part (about 1/16in.) is headed with a few blows from a light riveting hammer, the tacks at the ends merely having their ends turned down. After the riveting is completed the gunwales are put on.

These were formerly put inside the boat, being jogged over the heads of the timbers, but a stronger and neater plan is to put them outside, making them of a hard wood, preferably mahogany. The deck is screwed to them, and they serve also as chafing battens, protecting the sides. They should be about 1¾in. wide at middle, 1¼ at fore and 1½ at after ends, and ⅜in. thick. A rivet is put through the stem and both fore ends, and another through the stern, thus strengthening what was formerly one of the weakest points of a canoe. Nails are also driven through them and the upper streak and the head of each timber and riveted, making a much stiffer side than the old method. After the gunwales are in, the cross spalls may be shifted if necessary until the curves of both sides of the boat are perfectly fair and symmetrical.

The bulkhead timbers will be sawed from hackmatack knees ⅜in. deep and ⅛in. wide. They must be fitted accurately to place in order to make a water-tight joint, to do which, a piece of thin board is cut to fit closely, the timbers being marked from it. After the timbers are fitted as tightly as possible by this means, a little dark paint is laid on where the timber will come, the latter is put in place and pressed down, with a slight fore and aft movement, and on removing it, the points where it touches will be marked with paint.

These are cut away slightly, the piece replaced, and the operation repeated until the paint shows on the entire surface of the timber; it is then painted with thick white lead, pressed into place, and fastened by screws or nails through the planks at each lap and also in the middle of each strake, or if a wide strake, with two nails.

The bulkheads will be of white pine, ⅜in. thick; they are placed on that side of the timbers nearest the end of the boat, and are riveted to them. A door is sometimes cut in the bulkhead to give access to the compartment in place of a deck hatch. These latter are to be avoided if possible, as they are never to be relied on as water-tight, and being exposed to rain and waves, are apt to wet all below, while a door in the bulkhead, even if not tight, is only exposed to water in case of a complete capsize.

THE GALLEY FIRE.

CANOE AND CAMP COOKERY.

No canoe trip can be thoroughly enjoyed unless the canoeist is able to cook a square meal. A friend lately said to me: "I like to paddle around the harbor of an afternoon after office hours, but how a sane man can make a cruise of a week or more and live on crackers and condensed milk, surpasses my understanding. I tried it once and lost five pounds in four days, then I quit."

"But, Aleck, why didn't you cook up three good meals a day? Didn't you have your cooking outfit along?"

"Yes; but, Seneca, I never learned how to cook even a pot of coffee. I hung around the kitchen before I started and asked Bridget so many questions that she gave a week's warning. Besides, a man can't carry a kitchen range along in a canoe."

"Certainly not; but a canoeist, if he has the proper outfit, can bake, boil, fry, broil and stew without a range at all."

"Do you mean to say a man can bake without an oven?"

"He can certainly bake with no more of an oven than he can make himself with a few minutes' labor."

"I should like to know how."

"Well, I will give you a few pointers from my own experience, and trust you will give them a trial on a long cruise next summer. First, suppose you've caught a three-pound bass and want to bake him. Don't scale him, but just remove his 'in'ards,' and wipe him dry inside. Then dig a hole in the ground about eighteen inches deep

big enough to contain the fish. Build a fire in it and let it burn to coals, but leave the hot ashes on the bottom, and upon these place a thick layer of green grass. Lay your bass atop of this on his side, and cover him with another layer of grass. Now rake back your coals and loose earth, and build a small fire over all on the surface of the ground. After three-quarters of an hour dig out your fish. His skin will peel off and leave the flesh clean, and he will be baked better than any fish you ever tasted, because the juices are all retained. Now to bake bread—"

"Bread baked in a hole in the ground! Not much, Seneca. No sand in my bread, please."

"Not an atom, Aleck. For bread you must have plenty of coals, so a brisk fire must be kept up in the hole for five or six hours. Make what is called 'biscuit dough.' For one man take, say one quart of flour, and mix in it while dry a heaping teaspoonful of yeast powder and a couple of pinches of salt. Then add a teaspoonful of lard (if you use butter, don't put in much salt) and mix thoroughly. Add water, small quantities at a time, continuing the mixing till you have a good stiff dough. Now you want two basins, made each of one piece, without solder. Hammer the edges of these into a sort of rim, and put enough dough into one of them to fill it two-thirds full. Cover this with the other basin, take out all the coals except two or three inches in the bottom of the hole, set in your basins, and surround and cover them with hot coals. Spread earth over all, and go fishing for half a day. When you come back you'll have first-rate camp bread."

"But won't it burn?"

"No; it will rise, but not enough to reach the bottom of the upper basin, and the gases will escape where the basins come together."

"But it takes a whole day to bake bread."

"Yes, but a cruising canoeist has to stop for a day once in awhile to make repairs, and no canoeist is ever in a hurry, anyhow. That's the whole essence of pleasurable canoeing, to be free from all anxiety about reaching a certain point in a given time, to take it easy, and having his habitation with him, like a snail, to eat his supper and go to bed wherever night finds him. I heard this winter of a method of baking bread in a short time, however, and I mean to try it next summer."

"What is the method?"

"I'd rather not tell you till I've tried it, for I haven't much confidence in its success."

"Never mind; tell it, and I promise I won't try it till you report your experience."

"Well, you make your dough and roll it to a thickness of half an inch. Grease a frying pan and set it over hot embers till the grease begins to melt. Then put the dough into the pan set it on the fire, shaking the pan frequently to prevent the dough from adhering. When the crust has formed on the bottom, take the bread out of the pan and prop it up on edge, close to the fire, turning it occasionally to insure its being baked through."

"I'd rather you'd eat that bread than me, Seneca. Give me a recipe for a simple kind of flap-jack."

"The simplest flap-jack I know of is made this way: Put a small quantity of salt and flour in water, beat it with a fork till foam rises, and then mix quickly with more flour until you have a thin batter. Cook on a well-greased frying pan. This beating of salt and flour in water was used by old Injun Joe in camp instead of baking powder or yeast for making bread, and his camp bread was the best I ever tasted."

"I was down the Chesapeake last fall and got plenty of oysters, but nobody could cook them except in the old-fashioned ways, and I soon grew tired of them. Don't you know some good way of cooking them in camp?"

"Yes, I do, Aleck, and it's a dish fit for a star-route contractor. Get the largest oysters you can find, cut fat bacon into very thin slices, wrap an oyster in each slice, and skewer with a small stick. Heat a frying pan very hot, put in your oysters, and cook long enough to just crisp the bacon—not over two minutes, taking care that they do not burn. Serve immediately on slices of toast without removing the skewers."

"Yum, yum! You make me hungry to tell me that. Say, Seneca, why don't you send some of your Indian recipes to FOREST AND STREAM, for the benefit of canoeists and campers? They have started a 'Galley Fire' column, you know."

"Oh, all those old woodsmen and cruisers that take FOREST AND STREAM know more about camp cookery than I can tell them."

"But there must be, I am sure, a lot of 'fresh Alecks' among them like me, who would be glad of elementary instruction."

"Well, they can refer to a lady who teaches cooking schools, and who has written a book on 'Camp Cookery,' a book I have never seen, but my boarding-house keeper was a pupil of Miss Parloa's, and her consommés are heavenly. However, I will try them with a few dishes I can recommend from experience, and if they take well, I'll try to rake up the whole lot and send 'em in." SENECA.

LARGE VERSUS SMALL CANOES.

Editor Forest and Stream:

I have read "Widgeon's" letter with regard to the Stella Maris 27in. canoe and, although I agree with him on some points in favor of that type, I must say that after a cruise of 250 miles in one last summer I do not consider her up to the mark as an all-around cruising canoe. Because, first, she was never dry and sometimes not over safe in rough water. Why? Because she was too low, and had not enough sheer, and when running before the wind would poke her nose under as if about to "dive." Secondly, she is so small as to be unable to hold enough camp kit, as I found by bitter experience on my cruise, when we had exceptionally cold weather, and she would not carry enough blankets to keep me warm at night. Is that comfort? Thirdly, "Widgeon" speaks about cruising in a Stella Maris from Labrador to Cape Cod; it might be done, but I should prefer to be excused.

Now, speaking of portages and when the avoirdupois of a canoe counts, I do not see why one cannot be built, of the same length as the Stella Maris, but somewhat broader and deeper, which would weigh pretty nearly the same, and be far more comfortable and safer. FRIDAY.

CLUB SIGNALS.—We have to acknowledge the receipt of club signals from the Chicago, Rondout, Mohican of Albany, Alleghany of Pittsburgh, Keystone of Philadelphia, Rob Roy C. C. of Indianapolis, Ind., with a number yet to hear from. Where are the Cleveland, Cincinnati, Newark, N. J., Whitehall, Bayonne and Philadelphia clubs?

SPEED OF CANOES.—"Stormy Petrel," writing to the London *Field*, claims to have made 14¼ miles under sail in 2 hours 5 minutes; first 7 miles in slack water, last 7 with strong tide, the tide and distance being accurately noted. The canoe was 14ft. x27in., weighing less than 50lbs. This is not equal to Mr. Alden's trip of 60 miles in 7 hours on the Great South Bay last summer, but is very fair considering the size of the canoe.

LYMAN'S SIGHTS will help a man to use his rifle effectively. A shooter can do best with the sights he has become used to, and it is well to accustom oneself to the best. We know of no better now on the market than Lyman's.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

ST. BERNARD, Boston, Mass.—Breed her to a St. Bernard.

M. B. C., Oswego, N. Y.—Write to J. I. Miller, Montvale, N. J.

H. R., Boston, Mass.—Pilkington's Dash was by Laverack's old Blue Dash and out of Pilkington's Lill.

"FIVE CONSTANT READERS" ought to know by this time that we require name and address of correspondents.

C. W. E., Boston, Mass.—Probably you will find a satisfactory map of the New Brunswick region in Osgood's "Guide to the Maritime Provinces."

W. B. P., New York.—Perfection (A.K.R. 826) is a pure Laverack. Beauty (A.K.R. 806) goes back to Fauntleroy's Snake, and is not a pure Laverack.

A. D., Providence, R. I.—We don't know of an English greyhound named Leo I. Trace back the pedigree of your dog through the man you bought him from.

H. P. U.—What is the weight of the largest brook trout, *S. fontinalis*, on record? Ans. We know of none larger than the one in the National Museum, which weighed 11¼lbs.

C. S. D., Warren, R. I.—There are quite a number of Scotch deerhounds in this country. Write to Hillside Kennel, Lancaster, Mass. The price will depend upon breeding and quality.

H., Syracuse, N. Y.—1. Colburn's Dash was by Putnam's Dan (Paul Mead's Dash—Putnam's Nell), and out of Valentine's Fanny (Talcott's Sport—Talcott's Nell). 2. Write to Dr. William Jarvis, Claremont, N. H.

H. A. C., Portland, Me.—1. What is the best glue for split bamboo rods? 2. What is the best varnish for either bamboo or lancewood rods? Ans. 1. Get best white glue. 2. Use shellac dissolved in alcohol.

O. F. C., Pawtucket, R. I.—Dorothee is the dam of Othello (A.K.R. 756), Queen Bess (A.K.R. 757) and Le Beau (A.K.R. 755). Clio is the dam of La Belle (A.K.R. 754). Subscribe to the *American Kennel Register*.

P. D., New York.—Can I lawfully shoot quail from a trap on my own grounds in Westchester county, the birds being brought from another State? Ans. No, neither lawfully nor decently. The proper time to shoot quail is in the open season, and the proper mode is with a dog in the field.

YOUNG SPORT.—Will you please tell me what part of the stream I will find trout in the months of March and April? Ans. It is unlawful to take them in March. In April you will find them all along the streams where the water is clear and good, especially in pools and under banks, and other hiding places.

READER, Philadelphia.—Will you inform me where I can find good striped bass, or rock, fishing? I do not care about sea fishing. I prefer the bay or river fishing, where they run from one to five pounds. Ans. There is often good bass fishing down the Delaware River, and in the bay; also in the Chesapeake. The fish move so that particular points cannot now be named.

B. H., Norman County, Minn.—There is a fish is the Red River that closely resembles the whitefish in size, shape and color. It has golden circles around its eyes, and it bites at grubs and meat readily in May, June, July and August. Some call it whitefish, while others call it "golden eyes." What is the correct name of the fish and its habits? ANS. The description is not sufficient to decide upon the species.

P. E. H., West Liberty, O.—St. Bernard puppies sell from $50 to $200 each when ready to leave the dam, so you will find them rather too expensive for your purpose. Mr. Rodney Benson, P. O. Box 1,957, New York; Mr. E. R. Hearn, Passaic, N. J.; The Chequasset Kennels, Lancaster, Mass.; The Essex Kennel, Andover, Mass., breed St. Bernards. For a bulldog you may apply to Hillside Kennel, Lancaster, Mass.

S. R. D., Brooklyn.—1. Will you inform me where I can buy a first-class book on dog diseases and their treatment? 2. If there is any rifle fastened to the stock as the U. S. Springfield rifle? 3. Is not the repeater considered as good as any? I have Hammond's dog book, and like it very much. Ans. 1. "Management and Disease of the Dog," by J. Woodroffe Hill. We can supply it for $2. 2. We do not understand what you mean. 3. Yes.

W. N. MACA., Covington, N. Y.—Will you kindly inform me in your columns—first, if the crested titmouse (*Lophophanes bicolor*) is ever found in this section, and its average size; second, if bluewing teal, which I have shot having cinnamon brown legs (dark) and others havin light yellow legs and feet (apparently alike in all other respects), are of the same species. Ans. 1. Not commonly, we think, but it may occur occasionally. 2. The same. Difference due to age.

A. R., Pawtucket, R. I.—1. Can you uform me as to the best book on the dog, if possible? I shoul like one very minute in detail; also treating on the diseases of the dog, and have colored illustrations. I have never seen a book with colored plates, and do not know whether one exists. 2. At the same time please inform me if there is a book published exclusively on the mastiff. I have studied "Stonehenge," but he does not go into detail enough for me. Ans. 1. Vero Shaw's "Book of the Dog." We can supply it for $12.50, cloth; half morocco, $17.50. 2. No.

T. M. E., Washington, D. C.—I have a white wolfskin robe (new) which "sheds hair" so badly as to become a nuisance. Will the application of salt and alum, as stated in reply to "Tanner," in issue of Feb. 28, prevent the further shedding? I don't think the fur is moth-eaten, but that the skin was badly cured, as I have seen several other new robes in the same condition. Ans. It is possible that a bath of strong "pickle," *i. e.*, a solution of one part alum to two parts salt in water might fasten the hair, but we think it doubtful. You might try it, however.

S. W. A., Jr., New York.—Where will I be able to procure a print of one of the dogs, Dan by name, comprising one of the set by A. Pope, Jr., and published by Armstrong & Co., of Boston? There were twenty or more altogether, and, having most of the others, am very desirous of obtaining this particular one. The picture represents a liver and white pointer dog, Dan or Don, I am not certain which is the correct name, facing to the right, with head erect and holding a quail in his mouth. The mate to this picture is a dog called Bow, which I have. Ans. We cannot tell you where picture may be obtained. Have you written to the publishers?

C. P., Yonkers, N. Y.—Will you inform me whether the publication of the FOREST AND STREAM Kennel Register has been discontinued, and whether the *American Kennel Register* covers the ground of the other. Also, whether a copy of the FOREST AND STREAM Kennel Register can be obtained? Ans. The FOREST AND STREAM'S register entries were some years ago turned over to the National American Kennel Club, upon the representation that they were about to publish an annual stud book, and it was thought best that there should be but one book of the kind. The club did publish one volume of the book in 1879. Then after delaying a long time, they gave the entries for the second volume to a Western concern which has to all intents and purposes suppressed the whole thing. The *American Kennel Register* has taken the place of the former FOREST AND STREAM Register, and is, in fact, the only published record of the kind that is of contemporaneous utility.

ACCOMAC, Va.—Will the Kynoch brass shell answer for any gun, or do the guns have to be fitted specially to them? Are they as durable as the thick brass shells? Ans. The Kynoch shell being thinner than the ordinary brass shell, will not fit unless the chamber is bored specially for it. But the chamber may be reduced by the bushing process. For instance, the interior diameters of the barrel of a 12-gauge gun and of a 12-gauge shell are, say, .729 in. But the paper shell being, say, .030 in. in diameter, it is perfectly plain that the chamber of the gun to receive this paper shell must have a diameter of .729 plus twice .030, or .789. Now, were the Kynoch shell equal in interior diameter to the barrel of the gun, and only .007 in. thick, the chamber should be only .729 plus twice .007 or .743 in. It is evident, therefore, that the chamber bored to .789 for the paper shell, would, in that case, have to be reduced to .743 for the Kynoch .729 interior diameter. This could be accomplished by inserting in the chamber a steel lining which is bored out to the desired diameter. As a matter of fact, however, the Kynoch shells being made with exterior diameters to fit the present chambers of the several gauges, it has been found that a 12-gauge gun may be bushed with best advantage for a 14-gauge Kynoch shell, the interior diameter of the shell being .744 in. The process of bushing is made perfectly intelligible by the illustration given in our issue of July 5, 1883.

THE ROCK CREEK RABBIT FEAST.

A recent event, which caused much excitement in the vicinity of Rock Creek, Iowa, is recorded in verse by the local laureate, and printed in the Iola (Ia.) *Register:*

The farmers out on Rock Creek
Took notice last July,
That rabbits were in abundance,
And would vastly multiply.
They therefore promised the dogs and boys.
If they'd stop the vast increase,
That they should be rewarded
In the way of a rabbit feast.

So the farmers, to keep their orchards
From being demoralized,
And the ladies, to save their gardens,
Said they'd help to organize—
The boys, dogs and shotguns
To kill off the trifling beast;
And before the spring was over
They would have a rabbit feast.

So they organized two parties
To have a grand old hunt,
And save all game they captured,
From the Jack to the prairie runt.
Each hunter had to save his scalps,
And the gang who had the least
Had to pay for all expenses
Of the Rock Creek rabbit feast.

Last week they met and counted scalps
To determi e which side beat,
And make necessary arrangements
For their great big rabbit eat.
And they settled on last Tuesday night,
When the rabbits they had fleeced,
Should be served at the Rock Creek school house,
Where they'd have their rabbit feast.

Rutledge's gang won all the laurels.
As they had gained the day,
They'd eat a supper rich and grand
As Fisher's gang would pay.
For Rutledge's gang had killed the most,
And Fisher's gang the least,
Five hundred and sixty-five against two hundred and sixty two
Pays for the rabbit feast.

It was a dark and gloomy night,
For that the boys don't care,
And the farmers all turned out en masse,
And every girl was there;
And the ladies had the table spread
Good enough for any priest,
Loaded down with cakes and pies
For the glorious rabbit feast.

The entertainment too, was grand,
It was well worth your quarter;
They'd everything that heart could wish,
To the smile of a farmer's daughter.
I would not have missed that supper
For a meal or two at least,
I never had a better time
Than I did at the rabbit feast.

And should I live a thousand years
I'll think of the rabbit slaughter,
And never forget the love I have
For a Rock Creek farmer's daughter.
So now I've told you all I dare,
But I'll send this message east,
And wait for time to bring around
Another such a feast.

OMAHA, Neb., Feb. 27.—This afternoon four boys—Chris Madsen, aged 17; William Mallus, aged 12; John Stitt, aged 10, and William Abney, age not known—went out hunting. They had two guns with them, and it is presumed they chased a rabbit under a brick building three miles from the town, occupied as a powder-house by wholesale Omaha dealers. They either tried to smoke the rabbit out or fired at it. The powder-house exploded. It contained 500 kegs of powder, 375 of which were blasting powder. The four boys were blown to atoms, their flesh being scattered over a radius of 500 feet. All the trees in the vicinity were thrown down as if by a cyclone. One tree, fifteen inches in diameter, was torn out by the roots and blown a distance of 300 feet. A large hole marks the spot where the powder-house stood. The nearest house was half a mile distant, and every window in it was broken and every door split in pieces. Heavy fencing near the powder-house was carried like an arrow through the side of a barn near this house.—*Times.*

HUMPHREYS'
HOMEOPATHIC
VETERINARY
SPECIFICS

FOR THE CURE OF ALL DISEASES OF
HORSES, CATTLE, SHEEP, DOGS, HOGS, and POULTRY.

Co. Illust. Catalogue free. 109 Fulton St., N. Y.

"MIST COLOR" LEADERS.

Being consumers of nearly three-fourths of the total amount of silk worm gut imported in this country, and having in Murcia, Spain, increased our facilities for the manufacture of silk worm gut, we are enabled to secure a selection of material for our leaders beyond what even we have ever had. The leader being one of the most important articles in an angler's outfit, we have long given particular attention not only to the material of which it is composed, but also to the manner of making or tying it. *All of our leaders have a place every three feet, made quadruple by looping, so that the flies can be easily adjusted and will not wear the leader unnecessarily. All of our leaders are "Mist Colored."* Every envelope contains one dozen leaders; has our name and trade mark on it; states the length and quality of the leaders in it.

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for our 120-page illustrated catalogue.

Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

YELLOWSTONE PARK MATTERS.

SENATOR VEST'S bill for the protection of the National Park has passed the Senate. Just what the bill is may be seen by referring to its text, which is printed in another column.

An amendment offered by Senator McMillan, of Minnesota, and agreed to, although opposed by Senators Vest and Harrison, provides that "possession, within the said Park, of the dead bodies or any part thereof, of any of the animals or birds hereinbefore mentioned, shall be *prima facie* evidence that the person or persons having the same are guilty of violating this act." This amendment goes a long way toward nullifying the section forbidding the killing of wild animals, since men who may kill game within the Park, and can transport it beyond its borders before being detected, cannot then be interfered with. The change is thus an unfortunate one.

On the whole, the bill, as passed, is a vast improvement on the laws we have hitherto had in relation to the Park. While the area of the reservation is increased only two-fifths, instead of being more than doubled, as we had hoped would be the case, the enlargement is sufficient to greatly enhance its value to the people, and to include many natural features which properly belong to such a national reservation. Aside from the conservation of these natural beauties, which will attract the tourists of all countries, the fact that the Park is to be treated as a preserve for the indigenous wild animals of our western territory, must be a source of congratulation to all intelligent people. To naturalists of all nations this will be welcome news, and it will equally rejoice all sportsmen. It is to be hoped that the Senate bill may be passed by the House.

Assuming that the bill is to become a law, the question of its enforcement is the next one which will present itself to those who are interested in the Park. We have before alluded to the deplorable inefficiency of the attempts at protection last summer, and to the fact that the Superintendent and his assistants, while they were authorized and ordered by the Secretary of the Interior to perform certain acts, were not furnished with the means for carrying out their instructions. They were at first turned loose in the Park without horses, quarters or subsistence, and ordered—less than a dozen of them—to protect it, to arrest those who might break down the craters of the geysers, who might destroy the timber, or who might kill the game. They—a few inexperienced Eastern men—were to pursue on foot, and to capture, the mounted skin hunters. But, after they had performed this impossible task, what were they to do with those whom they had arrested? These matters have now been changed. The men have quarters, horses and rations. Their year's work in the Park cannot have failed to teach them something. Next summer, if they are the right kind of men, they will be of some use. Last year they were perfectly raw and unaccustomed to Western life, and so could not have been expected to accomplish much.

A careful study of Secretary Teller's response to the Senate resolution calling for copies of all papers and correspondence relating to the Yellowstone National Park since the last session of Congress, indicates that public opinion has not been altogether just to the Superintendent of the Park. He has been accused of neglecting his duty, of failing to put a stop to several illegal practices within the Park, and even of permitting his subordinates to traffic in specimens. Some of these accusations appear to have been made hastily and on insufficient evidence, as well as on the assumption that Major Conger had the power to enforce the regulations laid down by the Secretary of the Interior. The report of the special agent of the Interior Department attacks the Superintendent's administration of the Park very savagely, and shows that hunting has gone on openly and in bold defiance of the regulations. We do not find that the Superintendent has reported such violations of the law to the Department, and this he certainly should have done, even if it were not in his power to put a stop to them. Instead of receiving any reports of violations of the regulations, the Secretary of the Interior has several times had occasion to call the attention of the Superintendent to failures to comply with the law within the Park, a state of things which, under the circumstances, seems sufficiently absurd.

This neglect on the part of Major Conger finds some excuse in the fact that he has been hampered throughout by the knowledge of his inability to enforce the regulations established for the government of the Park, by the willingness of a large proportion of those within its limits to violate the law, and by the continuous hostility of the Yellowstone Park Improvement Company. This corporation, true to its traditions, has, during the past summer, seized in the most high-handed fashion everything belonging to the Government on which it could lay its hands. The Superintendent writes under date of Nov. 6, 1883:

"They help themselves indiscriminately to whatever they may want inside or outside of the Government inclosures without reference to any other interest than their own. They have cut and manufactured nearly all of the timber available for building purposes anywhere near this place [Mammoth Hot Springs] to build their great hotel and their numerous other buildings here. They have overrun the Park with their herds of horses and cattle; have wilfully and purposely broken down and destroyed the fences around the Government pastures, which I have taken great pains to repair and keep in order so as to enable us to keep the Government stock here without expense. Mr. Hobart has been heard to say that he would tear down the fences as often as I would put them up; that he would show me he had a right to do as he pleased here. The pastures, as a consequence, are eaten entirely bare of everything that an animal can subsist upon, and now I am compelled to take the stock all out of the Park to winter, or import feed for them here at heavy cost. They have several hundred head of cattle, besides a large number of horses; consequently they require and monopolize all the hay within twenty miles of here. And this is not all. Mr. Hobart has obstructed me in every way in his power ever since he has been here. He kept me from getting possession of McCartney's cabin, where I wanted to quarter some of my assistants, for more than a month, by telling the man whom I had ordered to vacate not to mind me but to stay there and that he would see him through, as I would not be here long anyway. Hobart has boasted in my hearing of his influence with you, and that he had frequent letters from you; and he told one of my assistants that you had promised him that I should not visit Washington this winter, and he also said that the reason you would not write to me was that you was not going to have my letters paraded before Congress. Not only this, but he has lost no opportunity all the summer, at his hotel, openly, before the thousands of people that have been there, and wherever he has been, to abuse and belittle me to every person that he could command the attention of, as I have been informed and believe. This company is now in financial disgrace all over the country. They have transferred their cattle and horses to Mrs. McGowan, notwithstanding which, creditors have levied attachments on them, and this is the situation here to-day."

From all this it is apparent that the Superintendent's position has not been a very comfortable one during the past year.

Special Agent Smith has touched one of the roots of the evils that have been so apparent when he alludes to the fact that the assistants ought to be frontiersmen, and the Superintendent, in making excuses for his assistants, rather naively and pathetically says of them: "I must beg you to remember that they are all strangers to this section of the country, and that a number of them are quite young and inexperienced; and I think some allowance should be made on that account, not only on their account, but mine as well." Not a particle of allowance on that account, Mr. Conger. If you appoint men who are strangers to the country, who are young and inexperienced, the responsibility can rest on no other shoulders but your own. We warned you last year against doing just this thing. There were plenty of good men to be had in Montana, Wyoming and Idaho—men who would have been willing and able to do their duty faithfully and well by the Government that employed them. Such men should have been appointed, and if they had been, their efficiency would have spared you a great deal of trouble and annoyance.

There are now before Congress at least two bills incorporating railroads to run through the National Park. If these bills, or any like them, are passed, and any railroads are laid into the Park, the good work that has been accomplished by Senator Vest and others will all be undone. We call attention to Mr. Hague's letter, in another column, which gives some of the many good reasons why no such permission should be given. The subject is one that could be enlarged on indefinitely, but it is hoped that Congress may be trusted to act wisely in this matter.

AN ADIRONDACK BILL.

FOR the present year the prospects for preserving the Adirondack forests appear dark. The lumbermen, aided by the lobby, have won over to their side so large a number of the Assembly that the good bills have been put one side, and a cunningly devised and carefully worded substitute, presented by Mr. Boynton, have taken their place. This bill, as originally framed, offered but little hope of protection to the sources of our great river, but after its introduction, Mr. Boynton gravely rose and began to offer amendments to it. The way being thus opened, every other Assemblyman proceeded to offer his little amendment. Thus followed the old scene, which has so often been witnessed by those who have followed the course of the game laws in the various Legislatures of our States. Each member desired to have his section exempted from the provisions of the bill. Some went further and intelligently (?) argued that this was a vile scheme of monopoly by which the suffering lumbermen of the northern counties were to be robbed for the benefit of the aristocrats of the southern portion of the State. The champion speech, however, was made by an Assemblyman whose name we do not give because it does not seem possible that he can have been correctly reported. The daily papers quote him as saying: "The Hudson River is an arm of the sea, subject to tides, and there will be plenty of water upon which to float the commerce of the State if not a drop of water flows into it from the Adirondack region." He went further, and declared that the river would be far more navigable if all the upper streams emptying into the Hudson were dried up. These streams brought down vast amounts of refuse and dirt, rendering dredging necessary every year. He declared that the Chamber of Commerce bill was a grand scheme in the interest of individuals, and was backed by an eager and unscrupulous lobby, which invaded even the rooms of members of the Legislature. He denied that any additional legislation was needed.

It seems inconceivable that any civilized man of the present day should make statements such as these. A boy ten years old would know better. The Assemblyman referred to may perhaps be acting up to his own ideas of what is right in opposing the preservation of the Adirondacks, but why he should be willing to publish his stupendous ignorance to the people of New York State, it is really hard to see. Mr. Littlejohn, of Oswego, shares with the gentleman quoted above the very questionable glory of uttering about the Hudson River, the veriest nonsense, knowing it to be nonsense. But then, from what is known of Mr. Littlejohn's

record this was to have been expected of him. Besides, he is understood to be himself largely interested in lumbering, and so is very naturally found on the side of those who are wholly indifferent as to the general welfare, provided only their own profits are not interfered with. These two Assemblymen and Senator Ingalls, of Kansas, who gained such a cheerful notoriety by his liberally intelligent views on National Park matters, ought really to be taken about the country and exhibited as specimen sticks of the timber from which a considerable proportion of our American law makers are hewn. If this were done a great work of political reform might be inaugurated.

In agreeable contrast to the utterances above quoted are those of Mr. Roosevelt and a few other gentlemen, who in all matters pertaining to the public good, take liberal and advanced views. It is satisfactory to see, now and then, in our legislative halls a man whom neither money, nor influence, nor politics can induce to turn from what he believes to be right, to what he knows to be wrong.

All that can be said of the bill is that it satisfies the lumbermen and the enormously powerful array of lobbyists, who have so well earned their pay at Albany. When this has been said it requires intelligence of no very high order to understand that it does not satisfy those who are looking after the best interests of the State.

It is even doubtful whether any bill protecting these forests will pass at all this winter.

The Tide of Travel, which during the winter has set so strongly southward to the Southern States, is now on the turn. Almost every day we hear from returned travelers, accounts of pleasant winter days, when good bags were made and glorious sport had in the South. The residents of these States must remember that each year the number of sportsmen who go South for the winter is increasing, and that all the destruction of the birds which is going on from year to year, cannot fail to seriously reduce their numbers. It will be wise then for these States to make an earnest effort to render the game laws something more than the mere dead letter which they are at present. In the absence of any other remedy, individual land owners can, by posting their land, keep off intruders, after the close season begins.

The Massachusetts Law.—The matter of a uniformity of game laws in Massachusetts is still with the Committee on Agriculture, which is expected daily to report.

The Sportsman Tourist.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

Thirteenth Paper—Folk-Lore.

SCAR-FACE, THE MAN WHO WENT TO THE SUN.

THERE was once a young man who had a great scar on his cheek. He was a very good young man, but because he had this deformity, the people made fun of him and called him Scar-face. There was a very beautiful girl in the camp, and one day Scar-face met her when she was going after water and asked her to be his wife. But the girl laughed and said: "Do you think I would marry such an ugly man as you are? When you get that great scar off your face then come and ask me. I don't want to marry an ugly man."

Now, Scar-face loved this girl, and his heart cried because she had spoken so badly to him, and he went off alone and prayed to all the animals to help him. His secret helper said to him, "Go to the Sun, he is good and will help you." Then Scar-face arose and started on to the Sun.

After the second day, he could travel only at night, for it was very hot. In the day time he slept in big holes which he dug in the ground. When he had come close to the Sun's place, he found in the trail some one's leaving. A war shirt was there and many weapons of strange and beautiful make. But he touched them not, for, he said, some god has left them there and will come for them. Now a little way further on he met a young man, the most beautiful person he had ever seen, his hair was very long and he wore a shirt and leggins and robe made of some strange animal's fur, and, his moccasins were embroidered in strange colors. The young man said to him, "Did you see a war shirt and some weapons lying on the trail?"

"Yes," said Scar-face, "I saw them."

"But didn't you touch them?" asked the young man.

"No," replied Scar-face, "I thought some one had left them there, so I did not take them."

"You are not a thief. What is your name?" said the young man.

"Scar-face."

"Where are you going?" asked the young man.

"To the Sun," replied Scar-face.

"My name, said the young man "is E-pĭ-sŭ-ahts [early riser, the Morning Star], the Sun is my father. Come, I will take you to our lodge. Now he is not sitting there, at night he will enter."

They came to his lodge, very large it was, and very beautiful. Many unknown animals were painted on it in strange colors, and behind it, suspended on a tripod, were the war clothes of the Sun, made of large and beautiful feathers and the skins of great animals. Scar-face was ashamed to enter such a great lodge, for his clothes were of common cow skin and his moccasins all torn with much travel; but Morning Star said, "Enter, my new friend; and fear not; our hearts are like our faces, we conceal them not."

They entered. All about were sitting-places covered with white robes, and everything was strange. One person sat in the lodge and that was the Moon (Kŏ-kŏ-mĭk'-e-ĭs: Night-light), the Sun's wife, and the mother of Morning Star, and she spoke to Scar-face kindly, and gave him something to eat. "Why have you come so far from your people?" she said.

Then Scar-face told her about the beautiful girl who would not marry him because of the ugly scar on his face, and that he had come to ask the Sun to remove the scar. Now when it was time for the Sun to return home, the Moon hid Scar-face under a pile of robes. But as soon as the Sun got to the door-way he stopped and said, "I smell a person."

"Yes, father," said Morning Star, "a good young man has come to see you, a very good young man. I know he is a good person, for he found my beautiful clothes in the trail and did not touch them."

"I am glad," said the Sun, as he entered the lodge and took his accustomed seat, "that a good person enters my lodge. Be friends, my son," said he to Morning Star, "with this newly arrived young man."

The next day the Moon called Scar-face away out of the lodge and said to him, "Go with Morning Star and hunt where you please, but never go near a large lake way out there, for by that lake live great birds with long sharp bills, which they use to pluck out people's hearts. I have had many sons, but these birds have killed them all except Morning Star. Never let him go there."

Now, one day when the young men were out hunting, they came in sight of this lake and saw the great sharp-billed birds swimming in the water. "Come," said Morning Star, "let us go and kill the birds." "No, no," said Scar-face. "we must not go near them," but Morning Star ran quickly to the lake, and so he followed, for thought he, "I may save him." The birds, seeing the young men close, came and fought them, and with their spears the young men killed them all, and they cut off their heads and carried them home.

Now, when the Sun came home that night, the Moon told him what a brave deed the boys had accomplished, and his heart was very glad. "My heart is glad," he said, when he had sung a song, "for the sharp-billed birds which have killed my children are destroyed. Speak, my son Scar-face, what can I do to pay you?"

Then Scar-face told the Sun about the beautiful girl he loved, and that she would not marry him because of the scar on his face. "Pity me," he said; "take off this scar which makes my heart so sad."

Then the Sun made some powerful medicine, and put it on Scar-face, which made him handsome, and he took him and Morning Star to the Moon, and said, "Look, mother; which is your son?" and she recognized Morning Star.

Then he took the boys away and rubbed some more of the medicine on Scar-face, and again he took them before the Moon and said, "Now, mother, which is your son?" and she looked a long time, but could not tell which was Morning Star, for the Sun had made Scar-face beautiful, just like his own son.

Then the Sun gave him some beautiful clothes and food and told him he could return home. "But, my son," said he, "do not marry that girl. A woman who will not marry a good man merely because he has a scar on his face is surely not a good woman. Be glad that you did not get her. But punish her, that the people may know that a bad face is no sign that the heart is bad." and he told him what to do.

When Scar-face started to return home Morning Star hung on his neck and cried, saying: "How can I part from my friend, my brother?" and the Moon also cried, saying: "How can I let my new son go away?" and all their hearts were sad.

Now, when Scar-face had come close to his home, he met a young man, and inquired if his father still lived in the camp; and learning which lodge his father owned, he entered and sat down, and no one knew him, and when he told his father and mother who he was and where he had been, for a long time they did not believe him.

Toward evening he walked out in the camp, and all the people crowded around him to listen to his wonderful story, and the beautiful girl whom he had loved called him away to one side, and she said: "You are such a good-looking man that I will be glad to be your wife," and Scar-face replied: "All right, come into my lodge to-night," and when she had come in and lain down beside him he smothered her to death with a robe, for so the Sun had told him to do, and he married good women and lived a long time, and when he died the Morning Star came and took him back to the Sun, where he lived forever.

[TO BE CONTINUED.]

DOWN THE YUKON ON A RAFT.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

Seventh Paper.

THE Tahkheesh Indian, who was ahead in a canoe, to show us when we were near the only canyon in the Yukon, would have let the raft go right on through as far as any valuable information was concerned. Long before we reached the canyon and its appended rapids, the passage of which every Indian in the country had predicted impossible for such a vessel as a raft, it was becoming painfully evident that our Tahkheesh guide in the canoe would inform us of the canyon just in time to be too late. Anticipating just such an emergency, and having ascertained that the proper camp was on the right hand or eastern bank, we kept the Resolute into the bank as well as the current would allow, for it was now so swift that it kept shooting us from one side to the other, and we were glad to keep from "jamming" the raft end on the gravel-banks and having ourselves torn to pieces.

Already the perpendicular walls of the canyon were in sight, and the first break of the white water entering them showed like the white teeth of a tiger as we started to make the bank in the swift current. This current helped us for a few seconds until we had nearly reached the shore, when it started us out, and from there an almost straight line of water led to the narrow canyon but a couple of hundred yards away. The first line that hands could be laid upon was thrown ashore, and our half-breed interpreter, Billy, jumped into the canoe and paddled ashore, and quicker than it takes to pen these lines one end was made fast to the strongest tree convenient and the other to a cross-log of the raft. There was no time for "snubbing" with so few to manage the line, and the raft was allowed a running gait of some twenty or thirty yards out into the swift water before it brought up with a twang that ought to have snapped an inch and a half rope, let alone the little quarter-inch flag halliard that was thrown out to do this duty of a giant. As the raft was brought up by the thread the current came rushing over the end of the logs and even over the cross-piece, and every one expected to see the halliards part, but they stood the strain, singing like a taut telegraph wire in a high wind until we struck the shore, and the raft was let down a few yards into a whirling eddy and tied up until an inspection could be made of the obstacles ahead.

This revealed a canyon about three-quarters of a mile long, to which was appended a series of rapids and cascades extending for another four miles. This canyon was not over thirty or forty yards wide and as many feet deep. Its banks were perpendicular columns of basalt, as regular as those of Fingal's Cave, and looking more like the workmanship of man than of nature. In this channel the water contracted to nearly one-tenth its average width, fairly boiled as it rushed through, and it must have been very deep to have allowed the entire volume to pass through even at its rapid gait. Dangerous as it looked, with its frothy waves running three and four feet high, I doubt if it was at all as perilous for a raft as the four miles of rapids that succeeded it, running, in the former width of the river, over shoals and bars of boulders, and tangled and intricate masses of captured driftwood, where it seemed impossible that a bulky craft like ours could escape them all as they appeared in echelon. Just at the tail end of these rapids came a cascade, where the river again narrowed into such small proportions that all the water could not get through, and it ran up over the ascending sides and poured down over these, making a perfect crescent of water. Here, too, near and just before this cascade, were pretty and regular columns of basalt, but in no way so high as those in the canyon four miles above. The portage around the canyon, made by the Indians, was over quite a high ridge, and then descended abruptly with a dizzy incline into a valley, which, after continuing nearly down to the cascades again, ascended a sandy hill very hard to climb. The hilly part around the canyon was pretty thoroughly covered with small pines and spruce, and all along the portage trail some miners that had preceded us had cut these down near the path and felled them across it, and then barked them on their upper sides, forming stationary skids along which they could drag their whip-sawed boats. Two large logs, on the dizzy declivity, well trimmed of their limbs and bark, made inclines on which the boats could be lowered into the valley below. Here they had floated their boats by tow-lines down to the cascades and had dragged them around this. It is not very hard to imagine that such a chapparal of felled brush and poles across the path did not improve the walking in the least. The day we walked over the trail on the eastern side of the canyon and rapids was one of the most insufferably hot ones I ever experienced, and every time one sat down it was only to have a regular "Down-East fog" of mosquitoes come buzzing around, and the clawing in the air and the slapping of the face was an exercise equally as lusty as that of traveling. The only way was to walk along brandishing a handful of evergreens from shoulder to shoulder. As one advanced they kept the same invariable distance ahead, as if they had not the remotest idea you were coming toward them. An occasional vicious reach forward through the mass with the evergreens would have about as much deadly effect as going through the same amount of fog, for I believe they could dodge a streak of lightning. Nothing was better than a good strong wind in one's face, and as you emerged from the brush or timber, it was simply delicious to see them disappear. If you would look on your back, however, you would see it spotted with them, even then crawling along and testing every thread in one's coat to see if they cannot find a thin hole where they can bore through. Once in the wind it is comical to turn around slowly and see their efforts to keep under the lee of a red shirt, as one by one they lose their hold and are wafted away in the wind.

Returning to the raft, nearly all of the remainder of the day was occupied in the splendid grayling fishing that was so abundant in this part of the Yukon, and if ancient writers were right in recommending these fish as proper food for sick persons, then Miles's Canyon (for so it was named in honor of the Department Commander who had ordered the expedition) would probably be one of the great health resorts of the world. They were delicious and fat, and as this fat the ancients also believed had the "property of obliterating the marks of small-pox, freckles, and other spots on the skin," if certain natural histories can be believed, there might also be some curative power for the infinite variety of mosquito bites that were making the tops of our heads, as we sat in rows at meal times, look like half-bushel displays of assorted red apples. These grayling were the most persistent biters I ever saw rise to a fly, and more uncertain than those uncertain fish usually are in grasping for a bait, for there were times that I really believed we got fifty or sixty rises from one fish before he was hooked or the contest would be given up. The same invariable two sizes, already alluded to in the previous article, were yet met, with here and there a slight deviation in grade. This grayling fishing was much diminished after we left the Miles's Canyon and rapids, but never wholly ceased until the White River, nearly a hundred miles below Selkirk, pours in its swift, murky waters, of supersaturated glacier mud, when all bait and fly-fishing ceases, and with only fish hooks as articles of barter with the natives, one must go into bankruptcy.

We did not leave this vicinity for two or three days after, and during our stay I believe that fully 400 or 500 were caught, and our Tahkheesh Indian allies, some ten in number, men, *women* and CHILDREN (graded according to type), lived almost solely off of our catchings. Whenever a little gravel bar ran out into the swift water and sent a long string of diminishing whirlpools from its point, there any one could satiate his fishing appetite. The Doctor was the only one with a reel in the party, and it kept a constant opposition in buzzing with the swarms of mosquitoes. The Doctor thought that the fish might be caught in seines, but as he tumbled off of the slippery rock where he was standing out in the water drawing them in, as he turned around to see the effect, no court martial was deemed necessary in the case. During warm sunny days not a "rise" could be had even in the shady places, but in the cool evenings with a few clouds over the sun, two or three flies on a line might each be rewarded with a fish at a single cast. The picture of a Michigan grayling in "Sport with Gun and Rod" is a most accurate portrait of the gamy fellows we captured near this part of the Yukon River, and I doubt not they are identical varieties, or very closely allied. Whenever the strong southern winds that had done us so much good in sailing over the lakes would cease, a light breeze from the north would follow with clearing weather and warm sunny days, and for a few days during this particular part of the year these zephyrs from the north would bring with them a perfect snowstorm of small brown moths or millers, not unlike the grasshopper plague of years ago on the Western plains. A puff of wind or an eddying gust would tumble many of them in the water where the current would pack them down in strings of brown color faster than the fish could think of eating them, and most curious of all it was during this very time that we caught our gamy grayling, and that, too, with brown flies. The millers caught by the water and drifted

into eddies would not be touched, and it was only when an isolated one came beating its wings and fluttering on the waters' top around the swiftest corners that a spring for it was at all certain, and a brown hackle dancing around in the same place would monopolize every rise within the radius of a game fish's eyesight. They were not much inclined to jump at any time in the vicinity of the canyon or its rapids, probably fearing that the mosquitoes would eat them up, as some one remarked, but on several other occasions and places, especially during quiet but lowering and rainy evenings, they could be heard seeking their suppers, being probably the gnats and mosquitoes the rain was beating down; at least, let us all hope so and pray for rain and graylings or grayling.* Our Tahkheesh friends were as much surprised at this peculiar kind of fishing as the grayling themselves, and expressed their astonishment in guttural grunts.

They ate all the spare ones we would give them, which was often nearly a dozen apiece. The largest grayling we weighed was two pounds and a quarter.

Early on the morning of the 2d of July a small rafting party of two or three persons was sent over the portage trail to get below the cascades and help the raft's being brought ashore at that point, and were supplied with rope for that purpose. A little after 10 o'clock in the morning, Billy, our half-breed, entered the canyon with our canoe and disappeared around the corner of the basaltic columns. At 11:25 A. M. we loosened the raft from her moorings and, although it took fully five minutes to pole her out from the eddy where she had been moored, she at last got under headway and started out. The first accident was a smashing collision with the basaltic columns of the canyon's west side, that tore off the inner log in a twinkling and snapped off the outer one and shot it into the middle of the stream. It swung around the landing place with tremendous velocity and soon took up its original swiftness. Right about the center the canyon widens out into a circular basin of basalt where the water's edge might possibly be reached on the western shore, and in this whirlpool and boiling cauldron it was thought that the raft might get left spinning around in the big eddies, but no such misfortune befel it, and it shot through the basin so that a person on the banks couldn't have told it from a stern wheel steamer. It went grating over the rapids below, laboring like a ship in a heavy sea until nearly down to the sandhills by the cascades, when Billy and Indianne, a large burly Chilkat-Tahkheesh Indian, rowed out to meet it at the bend and, then gathering itself like a horse for a hurdle, it rushed at the cascades, first buried its nose in the flying froth, and then rising in the air shot through at an angle of twenty-five or thirty degrees in the air, sinking to a level in the simmering suds beyond. The same old halliards was gotten ashore that had stood us so well before, but it snapped like a thread as the raft reached its end.

A second attempt, about 400 to 450 yards below the cascades, was more successful, with a good, generous shaking up of the whole. Not far from here was a little grove of small pines, that had been well seasoned by some disasterous fire raging through them within the last two or three years, and as our present deck looked like the horizantal plan of a pound of fish hooks, we determined to take advantage of this little grove to redeck our boat, which was accordingly done. All of these groves and timber districts must be subject to periodical devastation of fire, especially the conifers, the spruce, the pine and other resin-bearing trees, according to the appearances that were presented to us from time to time along our route, and are no doubt set fire to by careless campers of nomadic Indians, or more probably by their setting fire to dense masses so as to throw up a thick smoke that can be seen for miles as signals. In most of the fired ranges the trees are quite large, and falling into decay after having been killed by the fire, they soon form an entanglement of blackened limbs and trunks. This is anything but easy for a pedestrian to make any headway through, especially when it is coupled, as usual, with a dense growth of young trees, whose limbs extend to the ground. As I have worked my way through them at a rate of a mile in twenty-four hours, I could not help thinking of the chances of escape if a grizzly bear should be out taking the fresh air at the same time, and the two paths should intersect at an angle of 180°, and the bear was of that unreasonable nature that insisted on the whole path and that "mighty quick." But as no bear in his right mind would have lived twenty-four hours among so many mosquitoes for all the unwashed explorers from "the land of the midnight sun" to "the dark continent," no such a collision occurred, and I was left alone to fight my mosquitoes in peace. And, by the way, there is some reason why the grizzly should dread the mosquito of Alaska, and that reason is, that they have been known to kill them during the short summer months. Absurd as this appears, and as first it appeared to me, I was at last a convert to the theory advanced by the Indians, that the large brown bear of Alaska, here inappropriately, I think, called the grizzly, has been known to succumb to mosquitoes in these parts. I first heard of this on the lower river, and although I was in a better frame of mind than the average reader of the FOREST AND STREAM for believing the story, I did not, until an old trader in these parts who had no object in stuffing me, and whose every manner and conversation on every other subject was perfectly reliable, confirmed it. Should one of these big brown fellows, tempted by something unusual, as a savory mess of defunct salmon, wander down into or across a swamp unusually full of these prickly pirates, and they make their attack upon him, the bear is likely to rear up on his hindquarters, bruin fashion, and fight them with his paws until he is nearly exhausted and his eyes become vulnerable to the incessant attacks of the insects, and in course of time they are swollen shut, and if in this condition the bear is not able to get away from the district, or should get deeper into the marsh, starvation finally ends his sufferings. Hard as this is to believe I felt that the reasoning was not unreasonable and the outside facts in the case strongly corroborating it in all that was needed to make it appear possible and even probable. I think I have spoken in a former article of the widespread terror the brown bear produces among all the Alaska natives within the limits of my travels. I found the animals or heard of them, by this means principally, along the whole length of the Yukon, and extending back along all its estuaries whose Indian tribes visit the great river.

[TO BE CONTINUED.]

*"Would you say that graylings or grayling were caught in large numbers on the Upper Yukon?" asked one writer of another of the party as they sat together in the evening balancing accounts for the day. "It makes no difference whether you lie in the singular or plural in Alaska," was the unsatisfactory answer of the individual interrogated, who had supposed the questioner referred to the Yukon above this place as the "Upper."

Natural History.

THE DEER OF THE OTTAWA VALLEY.

BY WILLIAM PITTMAN LETT.

[Read before the Field Naturalists' Club of the City of Ottawa, Ontario, Canada, on the 13th day of March, 1884.]

"The antler'd monarch of the waste
Sprang from his heathery couch in haste.
But, ere his fleet career he took,
The dewdrops from his flanks he shook;
Like crested leader, proud and high,
Toss'd his beam'd frontlet to the sky:
A moment gazed adown the dale,
A moment snuffed the tainted gale,
A moment listened to the cry
That thicken'd as the chase drew nigh;
Then, as the headmost foes appear'd,
With one brave bound the copse he clear'd,
And, stretching forward, free and far,
Sought the wild heaths of Uam-Var."

—*Lady of the Lake.*

IN engaging, as briefly as possible, in the, to me, delightful task of dealing with the deer of the Ottawa Valley, I shall be obliged, for the sake of necessary conciseness, as far as may be, to steer clear of the rifle, the camp-fire and the runway, and confine myself to hard and, if possible, interesting facts connected with the history of the noble and beautiful race of animals of which I am to treat.

First and foremost on the list, properly and correctly, I believe, I shall place the wapiti (*Cervus canadensis*), the great stag of Canada. I do so on account of his being not only the most noble specimen of the genus in America, but by far the most beautiful and stately animal of the deer tribe in the world. No animal known to naturalists carries such a magestic and symmetrical set of horns as the wapiti. In this particular he far surpasses the great sambur of India and the red stag of the British Islands. A large male of this species will weigh between eight hundred and a thousand pounds, the female, when full grown and fat, weighing upwards of seven hundred pounds. The form of this noble animal is compact, strongly built and graceful, the only apparent drawback to its perfect beauty being the shortness of its tail. A large buck wapiti stands seventeen hands high, equal to the height of a large horse. The colour is yellowish brown, verging towards a dark, glossy brown about the head and shoulders, belly brown, and a yellowish white patch on each hindquarter. The horns, however, constitute the greatest point of beauty in the wapiti. Antlers of the largest size have been frequently met with measuring upwards of six feet from the burr, around the beam to the highest point, ornamented with four formidable brow antlers, two over each eye, each eighteen, and sometimes twenty-four inches long, curved upward, and elegantly tapering and sharp and smooth at the points. The other prongs or tines range from a foot to eighteen inches in length, and are nicely graduated to fine points, as if they had been artificially tapered and polished. The horns shoot upward with a graceful sweep, and are generally peculiar for the almost uniform regularity of their growth. The largest stag of the highlands of Scotland would appear but a mere fawn standing beside a full-grown, peerlessly-crowned stag of Canada. The monarch of the highland glens seldom reaches more than four hundred and twenty-five pounds in weight, while his giant American congener turns the scale, when gralloched, at double that weight.

The wapiti—long misnamed an elk—was formerly quite numerous in the Ottawa Valley. In contradistinction to the cariboo and the moose, he was found more generally on the southern shore of the river. One hundred years ago these animals were still present in no inconsiderable numbers in the county of Carleton, the hardwood forests of which were their favorite haunts. The horns of the wapiti are still quite frequently turned up by the plough in the vicinity of the city of Ottawa. I have frequently found them when a boy, in the woods around the village of Richmond, lying on the surface of the ground in a pretty fair state of preservation, a sure indication that not very long before those majestic animals must have been natives of our immediate neighborhood. The fragment of a wapiti horn, which I show you now, was found a few years ago near Eastman's Springs, and about eight years ago a much larger and more perfect specimen was found on the farm of Mr. R. J. Hinton, within two miles of the city limits. Many naturalists imagine that the presence of the wapiti in this neighborhood dates back to a period comparatively remote. This, however, can scarcely be the case, as facts more conclusive than even the finding of their horns can be adduced in proof of those animals having been numerous here less than one hundred years ago. Mr. Rice Honeywell, of the township of Nepean, one of our earliest settlers in this region, positively affirms that within the last seventy years he has seen the wapiti both alive and dead within four miles of the city of Ottawa, on the old Thompson farm. Mr. Honeywell knows well the difference between a wapiti and a moose, many of the latter he was in the habit of seeing in the same locality. This brings the period of the existence of this grand animal in our midst much closer and less remote than is generally supposed. The wapiti is still hunted successfully, being much less vigilant and much more easily approached than any other Canadian deer. In the Northwest, the Indians ride in amongst a herd, keeping well down on the necks of their horses, and thus frequently succeed in killing a herd of nine or ten in a few minutes. A wounded wapiti is a dangerous animal to approach unprepared, as many an unlucky hunter has found out to his cost.

The progress of settlement, the cutting down of the forests and the resistless march of civilization has driven those noble animals out of their old haunts. The race in this neighborhood was by no means exterminated; for then there were but few hunters, and the appliances for slaughter were of a much more primitive description than the arms of precision of the present day. Rifles in Canada were unknown in the days of the wapiti; and the weapon of the Algonquin, the Iroquois and the Abenakis was the bow and arrow. Like the Indian, the wapiti has had to travel before the aggressive strokes of the axe toward the setting sun; and he is now only to be found in Canada at the North and South forks of the Saskatchewan in any great numbers. Parker Gilmore, a famous sportsman and a naturalist of no mean order, says: "I do not think from the information I have been able to obtain from searching old authorities who have written on the fauna of North America, that the range of the wapiti ever extended eastward to the Atlantic seaboard; but that their habitat commenced with the prairie country, say Illinois or Indiana. However, those States have long ceased to know them; for, like other large game, they have rapidly retired before the tide of emigration. The upper waters of the Missouri, the plains around the fork of the North and South Saskatchewan are where, at present, this mammoth stag will be found most abundant."

The stag of Canada, like the cariboo, is essentially gregarious, the herds frequently numbering hundreds. Those grand animals, year after year, are growing scarcer. The assassin skin-hunter and the repeating rifle are doing their deadly work amongst them, and the time will shortly arrive, if legislatures in Canada and the United States do not forthwith undertake the needed work of protection with a strong and relentless hand, when this stately ornament of forest and prairie will leave his last shed antlers to tell the people of no distant day of the folly and improvidence which deprived them of a woodland glory of which any country ought to be proud. The miserable, thoughtless Indian, and the atrocious skin-hunter, have nearly exterminated the bison, the mightiest of all American game animals. The boundless prairies where they were formerly to be found by hundreds of thousands, even in millions, are now wide wastes covered by the white bones of the butchered herds. The tramp which shook the prairie as the mighty cavalcades thundered along, is no longer heard; and small bands of ten or twenty here and there, like heaps of ashes, indicating where fires had once been, alone tell the pitiful story of the present.

Do not say that I speak from a sportsman's selfishness. I never expect to kill a bison or a wapiti; but I love the beasts of the wilderness and the beautiful birds of the air. If I could, I would not exterminate even the skunk. Each beast of the field and each bird of the air has been allotted its proper place, and assigned its legitimate position of usefulness or beauty; and I hold no feeling in common with the man who, through avarice or cruelty, wantonly destroys them.

The wapiti has long been called an elk, while it has always been well known by naturalists that he has none of the distinguishing characteristics of the genus *Alces*, in either form, appearance, anatomy or shape of horns, but must be recognized as the head of the family of stags, the largest and the most stately of the whole tribe of the *Cervidæ*. To this family belong the red deer of the British Islands and the Indian and Asiatic stags. It is time that the misnomer applied to the wapiti were transferred to the moose, the true elk and undoubted congener of the Scandinavian and great Irish elk. In this particular of misnaming, history, year after year, repeats itself, and, as it were, causes the world to listen again and again to a gross misrepresentation, countenanced and tolerated by science.

THE BARREN GROUND CARIBOO (*Tarandus arcticus*).

As you are all doubtless aware, there are two species of the reindeer of North America—the barren ground cariboo and the woodland cariboo (*Tarandus rangifer*)—resembling each other in almost every particular, excepting in size of body and shape of horns. The barren ground cariboo is found in every part of Arctic America, including the region from Hudson's Bay to within the Arctic circle. It is somewhat smaller than our common deer (*Cervus virginianus*), the largest bucks seldom weighing more than 125 pounds when skinned and dressed. These animals, however, do not entirely confine themselves to the extreme north, but in the autumn migrate southward, and spend the winter in the woods, where they have been frequently killed by the Indians. Both male and female of this species have horns, and, like all animals of the deer genus, shed them yearly, in the month of February, somewhat later in the season than the red deer of America. Like the wapiti, the cariboo of both species have canine teeth in the upper jaw, but no incisors. The smaller species, not being now, nor has it been at any time common to the valley of the Ottawa, and being nearly identical in habits with the larger, I shall not go into any more minute particulars as to food, color, size or habits of the former, but proceed with a description of the larger species, which has always been, and is still, an inhabitant of certain parts of the Ottawa country.

The woodland cariboo (*Tarandus rangifer*), as I have remarked, is similar in appearance and habits to the *Tarandus arcticus*, but double as large, with shorter and stouter horns in proportion to its size. It inhabits Labrador and Northern Canada, and thence may be found south to Nova Scotia and New Brunswick, the northern part of the State of Maine and Lower Canada on both sides of the St. Lawrence, thence westerly in the country north of Quebec back of Lake Superior. It never migrates towards the north, but makes its migration in a southerly direction. In this particular it acts directly opposite to the course pursued by the smaller species in its migrations. The following is the description given by Audubon of this deer:

"Larger and less graceful than the common American deer, body short and heavy, neck stout, hoofs thin and flattened, broad and spreading, excavated or concave beneath; accessory hoofs large and thin, legs short, no glandular opening and scarcely a perceptible tuft on the hind legs; nose somewhat like that of a cow, but fully covered with soft hairs of a somewhat moderate length; no beard, but on the under side of the neck a line of hairs about four inches in length, which hang down in a longitudinal direction; ears small, blunt and oval, thickly covered with hair on both surfaces; horns one foot three and a half inches in height, slender, one with two and the other with one prong; prongs about five inches long, hair soft and woolly underneath, the longer hairs, like those of the antelope, crimped or waved, and about one to one and a half inches long." As to the color of the animal, this author states that, "at the roots the hairs are whitish, then become brownish gray, whiter on the neck than elsewhere; nose, ears and outer surface of legs and shoulders brownish, a slight shade of the same tinge behind the fore legs, hoofs black and throat dull white, a faint whitish patch on the side of the shoulders, forehead brownish white, belly white, tail white, with a slight shade of brown at the root and on the whole upper surface, outside of legs brown, a band of white around all the legs adjoining the hoofs and extending to the small secondary hoofs, horns yellowish brown, worn white in places."

This description is all very well, and in the main points generally correct. The rather arbitrary dimensions given of the horns is scarcely borne out or corroborated by the practical naturalist known as the hunter. The horns measured by Audubon for this description were likely those of a female. Here before you are two sets of horns of the woodland cariboo, both of which came from above the Desert River on the Gatineau, seventy or eighty miles further north. They are singularly dissimilar in appearance, and I am of opinion that both were taken from the heads of male animals. I saw a pair of cariboo horns some years ago in the possession of Mr. Hiram Robinson of this city, which were very much

larger, more massive and wide-spreading, and had many more and longer prongs than either of these. The height of a full-grown animal of this species is about four and a half feet, and the weight of its carcass about 350 pounds. Large bucks are occasionally met with nearly 400 pounds in weight. The food of the cariboo consists of mosses, lichens and creeping plants found in the swamps in summer, and in search of which it paws up the snow with its hoofs in winter. The flesh when fat is most delicious venison; when thin and meagre it is dry and insipid. The cariboo is the fleetest of American deer. In galloping it makes most extraordinary leaps; and as a trotter, the slow-going 2:15 horses attempting to compete with him would be simply nowhere. Like his useful congener—some authors believe them to be of the same species—the reindeer of Northern Europe, the cariboo is possessed of great powers of endurance, frequently escaping from the Indian hunters after the fatigue and starvation inseparable from four or five days of a continuous following up hunt. When the hunted animal gets upon glare ice, over which he can glide at a rate that would double upon the fleetest skater, the hunter is obliged to give it up as a bad job. The cariboo is a shy and exceedingly wary animal, and most difficult to still-hunt, neither can he be successfully hunted in deep snow, he being enabled to go over the surface of the snow like a hare, upon his broad flat hoofs. So far as I have ever been able to learn, it is only time lost attempting to hunt them with dogs. The hounds might follow the scent, but they could scarcely ever be in at the death, and it is pretty well known that dogs cannot drive them to water. They are, however, successfully still-hunted by Indians, and also by white hunters skilled in the craft. Large numbers of them are also frequently slaughtered when discovered swimming across a river or lake in their migrations. The cariboo is still to be found in considerable abundance on the Riviere du Lievres as close as sixty or seventy miles from the Ottawa, on the Gatineau River above the Desert, and in more limited numbers above Pembroke, in the neighborhood of Black River, and along the shores of Lake Nipissing; they are still plentiful on both sides of the St. Lawrence, beyond Riviere du Loup below Quebec. They are also quite numerous on the northern shore of Lake Superior. I have no recollection of cariboo being met with on the south shore of the Ottawa River, with the exception of an odd one occasionally many years ago; in each of such cases the animals had evidently strayed from the north side, which has always been their true and natural habitat. The skin of the cariboo, when tanned, is made into moccasins and wind-proof garments, and in its raw state is used in the manufacture of snowshoes. It is fine, thin, tough and durable. Frank Forester has described hunting the woodland caribou in the following terms:

"As to his habits, while the Lapland or Siberian reindeer is the tamest and most docile of its genus, the American cariboo is the fiercest, fleetest, wildest, shyest and most untameable. So much so, that they are rarely pursued by white hunters, or shot by them except through casual good fortune; Indians alone having the patience and instinctive craft, which enables them to crawl unseen, unsmelt—for the nose of the cariboo can detect the smallest taint upon the air of anything human at least two miles up wind of him—and unsuspected. If he takes alarm and starts off on the run, no one dreams of pursuing. As well pursue the wind, of which no man knoweth whence it cometh or whither it goeth. Snowshoes against him alone avail little, for propped upon the broad, natural snowshoes of his long, elastic pasterns and wide cleft clacking hoofs, he shoots over the crust of the deepest drifts unbroken; in which the lordly moose would soon flounder, shoulder deep, if hard pressed, and the graceful deer would fall despairing, and bleat in vain for mercy—but he, the ship of the winter wilderness, out-speeds the wind among his native pines and tamaracs—even as the desert ship, the dromedary, out-trots the red simoon on the terrible Sahara—and once started may be seen no more by human eyes, nor run down by fleetest feet of man, no, not if they pursue him from their nightly casual camps, unwearied, following his trail by the day, by the week, by the month, till a fresh snow effaces his tracks, and leaves the hunter at the last, as he was at the first of the chase, less only the fatigue, the disappointment and the folly."

While we have no historical record of the woodland cariboo ever having been found in any considerable numbers on the south shore of the Ottawa, I think there can be little doubt of its having been quite plentiful on the north side of the Ottawa within a few miles, sixty or seventy years ago. As mentioned before, stray members of the family have been, to my own knowledge, seen on the south side of the Ottawa, one having been killed at L'Origual about twenty years ago. The cariboo migrates in herds of from ten to two, three and four hundred, and it is a notable fact that a concealed hunter, with the wind in his favor, if he has ammunition enough and does not show himself, can slaughter a whole herd, providing the man behind the rifle is "the right man in the right place." While under ordinary conditions the cariboo is the most difficult of approach of any known species of deer, when accidentally met with under circumstances such as I have mentioned, the animals seem to be completely panic-stricken, and unable to make any attempt to escape.

[TO BE CONCLUDED.]

BIRD NOTES.

WHILE out on the 23d day of February, to find out if all the quails had perished during the deep snows and severe cold of the past winter, my dogs found a nice little bevy of eight. This goes to prove that Bob White has lived through the inclement weather and will multiply the coming season. My dogs also found on that day a woodcock in an alder thicket. Is not this early for Mr. Longbill to be in New England? Robins and bluebirds are plenty, and have been for the last three weeks. D. D.

GLENVILLE, Conn., March 4.

Partridges, squirrels, rabbits and such game have wintered well. While in the woods lately I heard numbers of gray squirrels barking all around me, but did not try to get a shot, as I was out for pine grosbeaks and bluejays, which have been very plenty. I have secured several fine specimens of males but taking no more than I wish to mount. The Lapland bunting and black snowbird are very scarce, have mounted but one of each. A. C. MILLER.

BROOKFIELD, N. Y., Feb. 10.

I saw a blackbird this morning. It was snowing very hard at the time, and my advice to the voyager was to lay his course due south for at least twenty days. Never saw one so early in the season before. PARSON O'GATH.

GORE, O., March 5.

SEALS IN THE UPPER ST. LAWRENCE.

BY C. HART MERRIAM, M.D.

SEALS are commonly supposed to confine themselves to the immediate vicinity of the sea; still they frequently ascend large rivers, and have been known to reach fresh-water lakes far in the interior. At least two have been killed in Lake Champlain, and several have been recorded from Lake Ontario. The most extraordinary record that I have seen is that already published in your columns concerning the capture of a seal in Onondaga Lake, in the interior of New York State. This animal was shot (April 28, 1882) by George F. Kennedy in the very suburbs of the city of Syracuse. (FOREST AND STREAM, Vol. XVIII., No. 15, May 11, 1882, p. 286). As stated by your correspondent, it must have ascended the Oswego River from Lake Ontario.

All of these examples belong to the species known as the harbor seal or dotard (*Phoca vitulina*), which is at present abundant in the St. Lawrence, fifty miles below Quebec. In the Brockville *Evening Recorder* for Jan. 11, 1884, appeared the following: "Seals in the St. Lawrence.—Several gentlemen crossing the river from Morristown this morning were considerably surprised to find in the open water near the first Sister Island an exceedingly lively seal, which was gamboling about in apparent glee. When first noticed it was making an abortive attempt to capture two winter ducks, failing in which it suddenly went under water and out of sight. Mr. William Griffiths, of Morristown, one of the gentlemen who witnessed the animal's gambols, says it was about the size of an ordinary Newfoundland dog. Seals have been seen in the St. Lawrence on several occasions during the past few years, and two have been known to meet death at the hands of fishermen, one at Chippewa Bay and one at Wolfe Island."

Upon reading this notice I wrote to Captain Ward Plumb, of the steamer Armstong, for further information, and he has kindly favored me with the following facts: He first saw the seal at 9 A. M., Jan. 11, ult., a quarter of a mile from Morristown, and says, "We were then crossing over to Brockville. It kept ahead of us all the way across, occasionally coming up so we had a full view of it. I should judge its size was that of the end of a flour barrel. Its color was a very dark brown. The last I saw of it was at 4 P. M. the same day, but have since learned of its presence about four miles above here, at a place called McDonald's Point. Two years ago one was caught in a gill net at Chippewa Bay, twelve miles above Brockville, but was dead when found." Chippewa Bay is about twenty five miles above Ogdensburg and fifty from Lake Ontario. Wolfe Island is at the point where Lake Ontario flows into the St. Lawrence, about 600 miles above the Gulf of St. Lawrence.

ORTYX VIRGINIANUS NOT IN ARIZONA.—The article in last week's FOREST AND STREAM (p. 104), copied from the Tucson *Weekly Citizen*, stating the capture of this species in the Barboquivari range, probably refers to the Massena quail (*Cyrtonyx massena*), which occurs abundantly in many parts of Arizona. *Ortyx virginianus* has not been traced further west than Central Texas, where it is confined to the country east of Llano Estacado, or Staked Plains; and the birds occurring there are a light-colored, grayish race, distinguished from *O. virginianus* proper by the name *O. virginianus texanus*, or Texan quail. *Cyrtonyx massena* presents somewhat of a superficial resemblance to *O. virginianus*, but upon comparison will be found exceedingly distinct, both in form and coloration. If not the Massena quail, the bird referred to must be one of the Mexican species of *Ortyx* (perhaps *O. graysoni*), none of which, however, have been taken on our side of the boundary line. In order to settle the question, it is very desirable that a specimen be sent for examination; merely a wing, with a portion of the skin of the breast, with feathers attached, would be sufficient to insure identification.—ROBERT RIDGWAY (Smithsonian Institution). [We were assured by the writer of the article in the Tucson *Citizen* that the birds were Bob White. We will have more definite information on the subject shortly.]

ICE ALWAYS FLOATS.—If I am not mistaken I read an account in your paper some time ago in regard to ice sinking in some small lakes in the spring. I once lived near a small lake where the ice would disappear very suddenly, and I was told that it sunk. Will you please advise me if you ever heard of such a thing?—W. D. S. (Smithport, Pa.). [Water expands in freezing, and ice always floats. Anchor ice, often seen on the bottom of streams, is formed there, and is held in its place by cohesion between it and the stones at the bottom. The impression that ice sinks arises, no doubt, from its sudden disappearance. It is usually supposed to sink in spring when the waters of the lake are growing warmer constantly, and the ice is melting from below as well as above. If under such conditions the waters of the lake are agitated by a wind and the warmer lower strata are thus brought to the surface, the ice will often disappear in a few hours.]

MANY RATTLES—Mr. Grant, of our town, has recently returned from Florida, where his son has a plantation, bringing many things which, though common there, are looked upon as curiosities here. Among the collection was one thing which is really a curiosity—it being the rattles from a rattlesnake killed near the plantation, and the tail shows twenty-nine (29) rattles. Bluebirds and song sparrows were seen here Feb. 17.—S. F. DEXTER (Pawtucket, March 8).

CONCERNING ROBINS.—*Editor Forest and Stream:* A few days since, while on a St. Augustine ferry boat, a native white man came aboard with a shotgun and a bag of forty robins, shot in the woods opposite Jacksonville. I inquired what he proposed to do with them, and he replied: "O, them's mighty fine eating, and we shoot heaps of them every winter." I looked the thing square in the face and replied: "Fortunate for you, sir, that you live in the South; if you were seen in the North with that bag of song birds in your possession you would be lynched, and your carcass given to the crows;" and turning on my heel, I moved to a less irritating atmosphere. Is it lawful, Mr. Editor, to so slaughter the little songsters that sing so sweetly about our Northern homes? Would it not be well for a few missionaries from the North to visit this section and labor with the lawmakers? It seems to be an inviting field with plenty to do. —A. T. S. [Robins are shot in the North as well as in the South. One country is not much behind the other in the wholesale methods of game killing. If our correspondent wants to do missionary work in this direction, he can probably find a field at home. But to give a man to understand that he is deserving of a halter is hardly the way to convert him to your way of thinking. Our correspondent neglects to tell us what the Floridian said, and this omission is to be deplored, for doubtless the remarks were interesting.]

Game Bag and Gun.

THE YELLOWSTONE PARK BILL.

WE print below the text of the bill passed March 6 by the Senate, providing for the enlargement and better protection of the National Park. It is an interesting document and will well repay study.

The letter from Mr. Arnold Hague, of the Geological Survey, will commend itself to our readers. The writer is thoroughly familiar with the Park, and his opinions are entitled to the greatest weight.

A Bill to amend sections twenty-four hundred and seventy-four and twenty-four hundred and seventy-five of the Revised Statutes of the United States, setting apart a certain tract of land lying near the head waters of the Yellowstone River as a public park.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the boundaries of the Yellowstone National Park, as now fixed by section numbered twenty-four hundred and seventy-four of the Revised Statutes, shall hereafter be as follows: Beginning at a point on the forty-fifth parallel of north latitude where said parallel is intersected by the meridian of one hundred and eleven degrees west longitude; thence due east to a point on said meridian within ten miles of the eastern boundary of the Park as now established; thence due south five miles; thence due east to the meridian of one hundred and nine degrees and thirty minutes west longitude; thence due south along said meridian to the forty-fourth parallel of north latitude; thence due west along said parallel to its point of intersection with the meridian of one hundred and eleven degrees west longitude; thence due north along said meridian to the place of beginning; and it shall be the duty of the Secretary of the Interior to cause an accurate survey to be made of the boundary lines of said Park as established by this act, said survey to be recorded in the offices of the Surveyor-General and Commissioner of the General Land Office of the United States, as provided by law.

Sec. 2. That all of the territory embraced within the limits of the Park as herein established shall be reserved and withdrawn from settlement, occupancy or sale under the laws of the United States, and dedicated and set apart as a public park or pleasure ground for the benefit and enjoyment of the people of the United States; and said territory so set apart shall be under the control of the Secretary of the Interior, and subject to all the provisions of sections numbered twenty-four hundred and seventy-four and twenty-four hundred and seventy-five of the Revised Statutes of the United States, except as herein otherwise provided.

Sec. 3. That the Secretary of the Interior shall make and publish such rules and regulations as he may deem necessary and proper for the management and care of the Park, especially for the preservation from injury or spoliation of all timber, mineral deposits, natural curiosities, or wonderful objects within said Park, and for the protection of the game animals found in the Park, to prevent their capture or destruction. He shall cause all persons trespassing upon the Park to be removed therefrom, and shall take all measures which he may think necessary to carry out the purposes of this act; and the Secretary of War is hereby directed to make such details of troops as the Secretary of the Interior, with the approval of the President, may require for the purpose of preventing trespassers or intruders from entering the Park with the object of destroying the game therein, or other illegal purposes, and for removing such persons from the Park.

Sec. 4. That the killing, wounding, or capturing, at any time, of any buffalo, bison, moose, elk, deer, mountain sheep, Rocky Mountain goat, antelope, beaver, otter, martin, fisher, grouse, prairie chicken, pheasant, fool-hen, partridge, quail, wild goose, duck, eagle, magpie, swan, heron, sparrow, robin, meadow lark, thrush, goldfinch, flicker or yellowhammer, blackbird, oriole, jay, snowbird, or any of the small birds commonly known as singing-birds, is prohibited within the limits of said Park; nor shall any fish be taken out of the waters of the Park by means of seines, nets, traps, or by the use of drugs, or any explosive substances or compounds, or in any other way than by hook and line. Any person violating the provisions of this section shall be deemed guilty of a misdemeanor, and, upon conviction, shall be fined for each offense not less than twenty nor more than one hundred dollars, or by imprisonment for not more than three months, or by both such fine and imprisonment. Possession of the dead bodies, or any part thereof, of any of the animals or birds hereinbefore mentioned, shall be prima facie evidence that the person or persons having the same are guilty of violating this act. Any person or persons, or stage, express, or railroad company, receiving for transportation any of the animals, birds, or fish named herein, knowing or having reasonable cause to believe that such animals, birds, or fish were killed or captured in violation of this act, shall be deemed guilty of a misdemeanor, and shall forfeit and pay for every such offense the sum of two hundred and fifty dollars, to be recovered by a proceeding in the nature of an information before any Territorial or United States district court within whose jurisdiction such offense was committed; and it shall be the duty of the district attorney of the United States for such Territory or district to institute and prosecute said proceeding in the name of the United States, the amount collected from the party offending to be paid into the treasury of the United States.

Sec. 5. That the Secretary of the Interior may lease small portions of ground in the Park, not exceeding ten acres in extent for each tract, on which may be erected hotels and the necessary out-buildings, and for a period not exceeding ten years; but such lease shall not include any of the geysers or other objects of curiosity or interest in said Park, or exclude the public from the free and convenient approach thereto, or include any ground within one quarter of a mile of any of the geysers or the Yellowstone Falls, nor shall there be leased more than one tract of not exceeding ten acres to any one person, association or corporation; nor shall any hotel or other buildings be erected within the Park until such lease shall be executed by the Secretary of the Interior; and all contracts, agreements or exclusive privileges heretofore made or given in regard to said Park, or any part thereof, inconsistent with this act, are hereby declared invalid; nor shall the Secretary of the Interior, in any lease which he may make and execute, grant any exclusive privileges within said Park, except upon the ground leased.

Sec. 6. That for the purpose of giving protection to life and property within said Park the laws of the Territory of Montana are hereby extended over the same, so far as said laws do not conflict with this act; and said Park is declared to be, for the purpose aforesaid, and the administration of justice generally therein, a part of the county of Gallatin, in said Territory, until Congress shall otherwise provide. All costs and expenses arising in cases under this act, and properly chargeable to the United States, shall be certified by the court or justice trying said cases to the United States marshal for Montana, and shall be paid by him out of any public funds in his hands, and be reported by him to the Department of Justice, as in the case of other cases in the United States courts. The violation of any regulation made and published by the Secretary of the Interior in regard to the control and management of the Park, and the protection of the game and public property therein, is hereby declared to be a misdemeanor, and the party convicted shall be punished for each offense by a fine of not less than twenty nor more than one hundred dollars, or by imprisonment for not exceeding three months, or by both such fine and imprisonment.

Sec. 7. That the Secretary of the Interior shall appoint a superintendent of the Park, who shall be paid an annual salary of two thousand dollars, and fifteen assistants, who shall each be paid annually nine hundred dollars. And it shall be the duty of said superintendent and his assistants to reside continuously in the Park, and to protect the game and public property, to preserve the peace, and prevent crime; and for this purpose they shall have power to arrest all persons committing any crime or misdemeanor within the Park, and shall also have all the powers and duties conferred by law upon the sheriffs and constables for the Territory of Montana, and their deputies: Provided, That the power hereby conferred shall be exercised only within the limits of said Park, and in conveying persons arrested to the nearest court or officer having jurisdiction of the crime or misdemeanor with which the person or persons have been charged: And provided also, That nothing herein contained shall be construed as preventing the United States marshals from serving within the territory of the Park any writ or process issued by lawful authority: And provided also, That no timber in said Park shall be cut, either for building purposes or for firewood, except by the permission in writing of the superintendent of said Park, specifying the place at which said timber may be cut, and the quantity thereof.

Sec. 8. That the Secretary of War shall detail an officer from the Corps of Engineers whose duty it shall be to survey and lay out suitable roads in said Park, and select the proper location for bridges therein; and the Secretary of War shall, upon the report of said officer, make annual estimates for the cost of such improvements, and communicate the same to Congress, with such other recommendations in regard to the Park as he may deem proper; and all sums received by the Secretary of the Interior from rents in the Park, or arising from fines or forfeitures for violations of the laws and regulations made for the government of said Park, and protection of the game and public property therein, shall be applied to the improve-

ments hereinbefore mentioned; and the officer or officers collecting said fines and forfeitures shall pay the same to the Superintendent of the Park, to be accounted for by him to the Secretary of the Interior.

Sec. 9. That all leases, contracts, rules and regulations made or issued by the Secretary of the Interior as herein provided for shall be subject to the approval of the President.

NEW YORK, Dec. 28, 1883.

Hon. George G. Vest, United States Senator, Washington, D. C.:

SIR—During an interview, last summer, on the borders of the Yellowstone Lake, you asked me, on my returning East, to give you my views about the Park, and such suggestions as seemed to me necessary for its protection and preservation. Expecting to be in Washington in January, I deferred the matter, hoping to see you then, and present a few suggestions more fully than I could by letter. Noticing, however, that you had brought the subject up in the United States Senate, I take the liberty of writing you in regard to one or two points upon which, it seems to me, some action should be taken this winter.

The most important object to be gained in maintaining the national reservation is the preservation of the forests which now cover the greater part of the Park plateau and neighboring mountains. The Park is situated along the continental watershed, in a region remarkably well favored in its rain and snow fall, and abounding in such broad sheets of water as the Yellowstone, Shoshone, Lewis, and Heart lakes. These lakes are the sources and natural reservoirs of the Mississippi and Columbia rivers, and for the supply and storing up of the waters the forest is an absolute necessity. Without arguing the question at length, I need only call your attention to the discussion now going on in New York State in regard to the importance of preserving the Adirondack forest, by State legislation, in order to maintain a steady supply of water for the Hudson River. The difficulties and expenses of buying and controlling this forest region at this late date are found to be very great.

No such reasons exist to-day against forever protecting the forests in the neighborhood of the Park; while the reasons for so doing are equally urgent. In a country like the far West, with its vast treeless areas rapidly being taken up by settlers, it is all the more important that certain exceptionally situated timber regions should be carefully protected by law, before seized upon by people.

For these reasons I wish to see the Park area considerably extended to the south and east, and at the same time to slightly alter the boundaries on the north and west. In the original bill setting aside the Park domain the boundaries are somewhat loosely stated, and should at all events be more clearly defined.

The present northern boundary is at the "junction of the Gardiner's River with the Yellowstone River." By making the 45th parallel the northern boundary it places the line about two miles south of the present one, and makes it the same as the boundary between the Territories of Wyoming and Montana. In making this change but little would be lost in the way of timber land or natural scenery needing protection. The Mammoth Hot Springs would still be two miles south of the boundary.

The western boundary is very poorly defined, the law reading "the meridian passing fifteen miles west of the most western point of Madison Lake." At that time Shoshone Lake was frequently designated as Madison Lake, and is so called in the bill setting aside the Park, as it was supposed to be the headwaters of the Madison River. As you well know, however, the Shoshone is one of the sources of Snake River, the headwaters of the Madison rising in a small insignificant lake. By placing the western line along the one hundred and eleventh meridian it would be made to coincide with the boundary between Wyoming and Montana, and would at the same time only cut off a strip about two miles wide. It would place the Park wholly within Wyoming.

According to the present law, the eastern and southern boundaries of the Park run ten miles from the most eastern and most southern points of the Yellowstone Lake. Now the southeastern end of Yellowstone Lake is low marshy ground, and between high and low water there is a considerable difference in the position of the shore line, a difference which might easily at some future time give rise to questions as to the ownership of valuable timber. This, however, a trivial question compared with the importance of extending the area of the Park both south and east. In my opinion the forty-fourth parallel of latitude would be the most suitable southern line. By extending the Park as far south it would take in a rough mountainous country mainly made up of volcanic lavas, but densely covered with forests and a resort for large game. On the other hand, by extending the line still further south, there would be some danger of including what might prove, upon exploration, to be valuable mineral lands, as well as lands favorable for summer pasturage. This is the line, I believe, suggested two years ago by General Sheridan.

To the east of the Yellowstone Lake lies a broad elevated region, singularly rough and wild, full of striking and grand scenery, and densely covered forests. These mountains are the resort of large animals, and are regarded by hunters as the best game region anywhere in this part of the country. As shooting within the Park limits is prohibited, these mountains are already frequented both for sportsmen and those shooting to supply the demand of visitors in the Park for fresh meat.

I would recommend making the eastern boundary the meridian of 109° 30'. This would extend the area of the Park about thirty miles to the eastward of the present boundary. It would take in all the streams draining westward to the Yellowstone River and the headwaters of most of the streams running eastward, besides adding largely to the domain of timber and protected game area. General Sheridan advised carrying the line further east, to Cedar Hill. This, I understand, would take land already occupied by ranchmen as grazing country, upon which a number of people have already settled. It is also more likely to embrace valuable mineral land, and is moreover a far less definite point than a standard meridian line.

As a Park for the preservation of game the present limits are by no means satisfactory, if it is intended, as it should be, to make the place one where large game will naturally roam, particularly when driven in from outside for protection; the neighborhood of the hot springs and the geyser basins is one which has never been used to any great extent by game as a permanent haunt, and the broad volcanic plateau lying between the geyser basin and the Yellowstone Lake and canyon is not a favorable grazing country. On the other hand, the mountains lying to the south, east and west abound in game, and present all the natural advantages sought for by deer and elk. Enlarge the Park and you make the whole area a game country.

It seems to me it should be the policy of the government, in the management of the Park, to protect above everything else the timber and game. If this view is correct then the admission of railways within the Park should be prohibited. Nothing would tend more to destroy the timber by the mere passage of trains through the forest. Moreover, the locomotive whistle and the additional traffic caused by railway transportation would convert the place into a public highway and tend to destroy all aspects of a Park. It would most effectually drive out all large game. The Park should be kept as a place of recreation and rest for those who can afford sufficient time to enjoy its benefits and reap the advantages of an out-door life. The country already offers a sufficient number of resorts for gripsack travelers who like to huddle together in large hotels and move with the crowd.

It is also very essential that more efficient means be taken to prevent the destruction of the deposits and incrustations around the springs and geysers. Probably no other place in the world bears any comparison to the Yellowstone Park in the display of the phenomena connected with thermal waters, and every precaution should be taken to preserve the place from destruction by tourists.

During the past season the demolition of these natural curiosities has been very great. I was surprised at the condition of the Mammoth Hot Springs upon my first visit early in August, but on returning to the springs in October I was amazed to see to what extent the destruction of the deposits had been carried on in the short space of three months.

Upon the general management of the Park I have some views which I would be glad to express to you, but preferred, in this already too long letter, to restrict myself to some of the more scientific questions, such as the all-important one of maintaining the forests, the protection of large game, and the preservation of natural curiosities of a scientific interest.

Very respectfully, your obedient servant,

ARNOLD HAGUE,
Geologist, United States Geological Survey.

BURSTED GUN BARRELS.—We presume that most men who know anything about guns are aware that it is injudicious to discharge a gun or rifle which has an obstruction in its barrel, for it is very likely that the barrel may be bursted. This familiar principle has lately been made the subject of a number of experiments by Mr. W. McK. Heath, of Philadelphia, who has burst several guns and rifles by shooting them with stuck bullets, snow, wet sand or mud in the barrel at the muzzle. Mr. Heath publishes a photograph showing the condition of fourteen such barrels after his experiments. He is with J. C. Grubb & Co., Philadelphia.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I was pleased with the paraphrased remarks you made in issue of Feb. 21, to the effect that a comparison, muzzleloader versus breechloader, was a dead issue. Just so I consider it. No sportsman wants to go back to the muzzleloader. The advantages of the breechloading system are so well settled that it is quite proper to let all discussion on that point drop right here, save only that suggested by my first inquiries, the vital one of shooting qualities.

It so happens that we have to charge the shells of our breechloader upon principles (as recommended by the best authorities) entirely different from the charging of our old muzzleloaders. These principles are not understood by numbers who are novices with these improved weapons. I am free to confess my ignorance. This difficulty is aggravated by the various and contradictory instructions published by the different manufacturers. One utterly eschews paper shells and advises the use of metal shells exclusively. Another, a proportionately larger charge of powder than of shot. One, to use a pink-edge felt wad two sizes larger than the gauge of the gun. Still another claims that this is wrong; use wads of same gauge but two or three thicknesses of them between the powder and shot. Then, too, in the country, where breechloaders are rapidly being introduced, the force of old habit is so strong, aside from the further difficulty of obtaining exactly what you want in that line, for you cannot pick it up at a country store, your economical countryman loads his shells with an ordinary charge of common powder, a dossil of old paper for a wad, a charge of shot, and another dossil of old paper for a wad—the same as he managed his old muzzleloader—and so I might go on at much greater length, but this will suffice. Hence arise a diversity of results, independent, probably, of the intrinsic shooting qualities of the arm considered alone. Is it any wonder, then, that so many complain of failure?

If my former views, or inquiries rather, have led any of your correspondents astray touching these pertinent matters, I beg to recall them to the points proper for discussion—*range, closeness of distribution, and penetration.* How to attain these three desiderata.

In making comparisons, I think it quite proper to compare guns of equal gauge or caliber, using charges of same quantity or quality.

The result obtained by your correspondent "Oct," p. 66, Feb. 21, is certainly far ahead of anything in the way of pattern I have been able to accomplish.

If such grand results are only attainable, as some correspondents seem to intimate, by an increase of caliber (heavy weight and large gauge), then your modern "Sampson" has the advantage, for, while he may rejoice in slamming a quarter of a pound of shot after a single bird, very few of us small folks could stand up to that sort of "racket," nor would we, if we could.

I would commend the attention of the "big gun" men to the article by N. E. White to the Sacramento (Cal.) *Bee* (published in your paper of Feb. 28), as well as to my own in same issue.

BACKWOODS.

BEVERLY, W. Va.

Editor Forest and Stream:

I have owned half a dozen and experimented with as many more, both 10 and 12 gauges of standard manufacturers. My trials have proved to me at least the fallacy of a great many assertions about the sure killing powers of guns loaded with from 3 to 4 drams powder and from 1 to 1¼ ounces of shot. I have yet to see the gun, either of 10 or 12 gauge, I don't care how it is loaded (providing it is a field gun), that will kill every shot at 90, 80 or even 70 yards, measured distance. Of course a person will occasionally make an extra long shot, but to depend on it every time brings little but disappointment. A close, hard-shooting gun of either gauge loaded with the proper proportions will kill with No. 8, 9 or 10 shot, quail, snipe, woodcock, etc., with reasonable certainty at from 45 to 50 yards, which is the limit of certainty for these sizes. The larger sizes of shot will kill further simply on account of maintaining a greater velocity during flight over same distance. But the larger the shot the larger the pattern, and the greater distance between pellets decreases the certainty of killing very rapidly. If, on trial, the gun loaded with No. 4 to 6 shot will give a pattern at 60 yards, so close and evenly distributed that a duck or same sized bird cannot escape being struck even by one shot, I should not try to get a better one.

As to the most effective gauge, opinions differ widely. I prefer a 12-gauge for general shooting, on account of using less ammunition per load, and having less weight of ammunition to carry for given number of shots; and I think it has equal killing power. For general shooting, if loaded properly, a 12-gauge 2⅝-inch paper shell, loaded with 4 drams powder, 2 pink-edge wads and 1⅛ ounces shot, sizes from 6 down, or 1 ounce shot, sizes 7, 8, 9 or 10, will give as good result with most guns as any one could wish for. Of course the load is for the extreme distances; less powder and shot answers very well for shooting in cover. * * * *

Editor Forest and Stream:

There are three things in which I think many of us err. We use the small shot and too heavy charges, and are not careful enough in suiting the size of the grain of the powder to the length of the barrel of our guns. My field gun is a 12-gauge Webley, barrels only 26 inches. For larger game, ducks, etc., I use a 10-gauge, 30-inch barrels. In this gun I use 4 drams No. 8 Curtis & Harvey's powder and 1¼ ounces of shot. In the 12-gauge, 3 drams a size finer, with 1 ounce shot. Some may ask, why this change in the quality of the powder? All will admit that in order to get the full power of the powder it must be burnt in the barrel. If I load my 26-inch gun with the coarser grade, I find some of it blown out without being burnt, adding nothing to the force of the charge. In my 30-inch barrels a much smaller portion escapes, as it has longer time in the barrel to ignite and exert its force behind the shot. In regard to the relative charges of powder and shot, my experience teaches me that the proportions stated are not far out of the way. We want always all the speed put into our lead that we can get, even then it sometimes seems to me a frightened quail will keep ahead of the swiftest shot; so we must not plug up our guns with too much lead. Am I right? I claim that no small proportion of the birds we hit are lost because they are not knocked right down, but fly out of sight before they drop. I admit that at the best, we cannot always make dead shots, but I do believe that the wounded birds we leave for the foxes would be less if we used heavier lead. For woodcock I use number eight. They are a tender bird, and if hit with but three or four pellets, are pretty sure to stop, where the plucky "Bob Whites" sail away beyond your sight. For them and ruffed grouse I find number six is not too large.

As to muzzle or breechloaders, I am sure your verdict is in accordance with the facts; the muzzleloaders are a "thing of the past." Years ago I owned one, a far-shooting gun; with its left barrel I have killed a good many foxes over ten rods away, but my breechloader will do the same thing, and it is always ready for the next fellow. I hope that others will be induced to enter into this discussion. Take it for granted we all have good guns, now let us tell each other how to load them to fill our bags and let the foxes go hungry.

SPICEWOOD.

CENTRALIA, Pa.

Editor Forest and Stream:

We are very apt to place our poor holding on our gun. I remember that, for a year or two, I experimented largely endeavoring to secure a gun which would kill, and did not learn to shoot well until I studied holding.

In a certain city in Massachusetts there lives a retired man of business, who, for a hobby occupies his time dealing in guns and rifles in a small way, going hunting occasionally, and experimenting extensively. Indeed, though it may have happened, I never knew Mr. Sam Brown to go into the field loaded twice alike.

One beautiful autumn morning (I remember it well from its perfection) together we started full of joy and hope for a day's sport. Sam had a habit of straying off by himself, the better I suppose to notice the result of some deeply matured experiment. Happening, as usual, to miss him, I soon discovered him all doubled up, with every appearance of extreme caution in his manner, trying to creep up on a grouse which was viewing him with calm contemplation from its perch on a wall. Approaching within about forty yards, Sam slowly raised his gun and was about to fire, when to his astonishment the grouse asked, "Are you Sam Brown?" "Yes," said Sam, after partly recovering from his astonishment, "I am." "Well, then, Sam," said the grouse, "blaze away, blaze away."

RIGHT AND LEFT.

HILLSBORO BRIDGE, N. H.

Editor Forest and Stream:

I was very slow to acknowledge the superior qualities of the breechloader, and the first one I owned proved to be a very inferior weapon, although I paid a high price for it; but I tried again, and this time obtained a piece which satisfied me that a good breechloader would do good execution. I have owned five as good muzzleloaders as any one, and eight breechloaders of the best American and English make, and with the exception of the first breechloader they were all far superior to the muzzleloaders, both in pattern and penetration.

I was greatly pleased with Mr. H. E. White's article from the Sacramento *Bee* in your issue of Feb. 28, as it expressed my own views of a gun for game-bird shooting.

There are hundreds of sportsmen to-day who think that nothing short of a 4 or 8 bore of 16 or 25 pounds will kill wildfowl. I have used 6 and 8 bores, and found them exceedingly unhandy in a light duck boat, beside requiring a vast amount of ammunition.

Last fall I purchased a 10-bore, 10¼ pounds, and found I could kill more ducks with the same amount of powder and shot than I could with the heavy guns, that is, a pound of powder and five pounds of shot used in the 10-bore would bag more ducks than if used in the 8-bore.

I am well aware that more havoc can be done to a flock of wildfowl at one discharge from a gun loaded with 7 drams powder and 2¼ ounces shot than from one loaded with 1¼ ounces, but where ducks are flying in singles or pairs the 10-bore is the weapon I prefer, and if properly loaded will kill a single duck nearly, if not quite, as far as an 8-bore.

I know there are large gun advocates who will differ with me, but after having used 6 and 8 bores I am satisfied to use a 10-bore for all wildfowl in the future.

I have killed large numbers of ducks with my field gun, a 12-bore, 7¾ pounds, and when on the marsh rail shooting, have killed teal with 2½ drams powder and ¾ ounce 10-shot at 30 and 35 yards.

I have three breechloaders now, and have tested them with the best muzzleloaders in this vicinity, and have not found one yet to beat me, although some of the guns were much heavier than my own.

GEO. F. ALDEN.

FISHKILL-ON-THE-HUDSON.

Editor Forest and Stream:

A good breechloader will beat a good muzzleloader in one way only, viz., distribution. As distribution means everything in a shotgun, it must be conceded a superior weapon. Powder will give the penetration far beyond the "hitting" range of either. I speak of good guns. A good muzzleloader will beat a poor breechloader and *vice versa*. A very heavy muzzle gun may be a better gun for long range than a lighter breechloader, but a really good 10-bore 10-pound breechloader will beat any muzzleloader same weight and bore, at all ranges. This opinion is backed by just such a gun and something to make it more interesting if desired.

Some one asks about the relative shooting of 10s and 12s. I think the superiority of the 10 gun is mainly due to the extra weight and larger bore, chambering more shot and burning more powder; 4 drams powder and 1¼ ounces shot is just as effective in a 12 as a 10-bore. Bogardus used a 12-gauge in all matches shot in England, and made them all drop their dollars. In a pigeon match shot at our town some years ago, a 12-gauge muzzleloader "grassed" more birds than any one gun in the match. But for general shooting a 10-bore is preferred, as it will take in more "territory." There is one very important factor in gunning that is quite often overlooked—"The man behind the gun." Good holding will make a poor gun appear to very good advantage.

Good loading is very important; cheap powder is as good as any, but cheap wads are an abomination. My advice is to buy a 10-bore 10-pound gun from a reliable maker. 38.

MARION, Ind.

Editor Forest and Stream:

I have been using shotguns ever since I could hold one at arm's length. I have had several of different makes, both muzzleloaders and breechloaders, and after careful and thorough tests I must confess that the breechloader, properly loaded, will surpass the muzzleloader, both for pattern and penetration. The best test is game shooting. I have killed a good quantity of game in my hunting, and I never yet had a muzzleloader kill a deer, wild goose, duck or turkey over 50 yards, while, on the other hand, I have killed with my breechloader deer, turkey and wild geese from 80 yards to 100 yards in several instances; and I killed one deer this winter at 120 yards, measured, hitting it with two shot in the neck. I am now using a 12-gauge, 36-inch Damascus barrel.

weighing 10¾ pounds. This gun when properly loaded is sure to kill at 100 yards, if held on the game.

There is a great deal in good powder, shot to fit the muzzle of your gun and shells properly loaded. I use in deer hunting, nickle-plated shells 2¾ inches long, 3½ drams Orange Lightning powder, 2 pink-edge wads, hard down on powder, 12 buckshot weighing 1¼ ounces, 1 pink-edge wad, well down on the shot. Then I run wax from a wax candle all around the edge of the wad on shot—nearly equal to crimping.

I have used this gun two years, it has never failed to do execution under 100 yards when held on the object shot at; it is as good as when first bought, and not for sale. I have never had a muzzleloading gun to shoot anything like the breechloader, and I've owned some fine guns, both 10 and 12-gauge. I prefer the 12-gauge to any other, believing they give more satisfaction. I owned a 10-gauge gun before I bought the one I now have and sold it, soon after I tested its shooting qualities. I have owned muzzleloaders, made by W. & C. Scott & Son, W. W. Greener, H. & J. W. King, and Bliss & Hutchinson; the last I still have and keep it for old associations' sake. I find a heavy gun does better and harder shooting than a light gun, and I prefer the close choke to any other. My gun shoots any size shot well, and a turkey, duck, or squirrel, with No. 6 shot at 50 yards, is in great danger of losing its life. I owned a 12-gauge, 32-inch, five years ago, and sold it, not liking the way it scattered large shot; since then I have found out it was my fault in loading, not the gun. Mark Ivel.

Alabama.

Editor Forest and Stream:

I like small bores for several reasons. They handle with a clean, prompt feeling, which of itself is a pleasure. A 6-pound gun weighs 12 pounds by night, especially if the bag is light and the tramp long. Large guns for flocks are certainly effective weapons, but why carry a number of pounds of often high-priced wood and iron for the occasional big chance, ignoring the average shooting of the section within your reach. I commenced some twenty years ago with a 16-bore, single muzzleloader. Getting "tony" I bought a 14-bore, double gun, then a 12, then a 10, and back to a 14-bore. Losing some geese (*A. canadensis*) because their size made me think I was near enough when I wasn't, I invested in an 8-bore, double, being determined to be prepared next time. I followed "float gunning" off and on all that winter, but my big gun was generally quiet. An old 10-bore Lane & Read did most work. These I sold and bought my first breechloader. I had done good work with my old friends, but I have never regretted my change of system, and of course to-day argument is superfluous. That is, as a rule. I have owned two 12-bores, one 10 and a 16. The 10-bore I used shooting hagdons, and such sea birds, on the banks of Newfoundland. It shot well and killed clean, but a 12-bore, then at home, has since done equally well. I shot two seasons from a float and on the marshes, using a 12-bore, and the birds I got were numerous and varied.

I used a 12-bore while in the Arctic, and have fed the whole ship's company repeatedly. I shot seals, gulls, eider ducks, old squaws, brant geese, plover and ptarmigan. This gun was a pleasure to shoot. Alas, to-day I have it not. It was sold in far Northern Siberia, where I was with other survivors of the Jeannette. The articles gotten in exchange were sorely needed or else I should never have parted with her. I called her "Betsy," and now we "are out." To-day I am using a 16-bore Parker, 6 pounds. It is a strong shooting gun. My first day out with it I got thirteen snipe (*G. wilsonii*). One I shot dead and picked up fifty-four paces away. I shot a curlew (*N. hudsonicus*) dead at seventy-six paces. The bird is stuffed and in my dining-room to-day. Charge, 2¾ powder, 1 ounce No. 8 shot. Sportsmen, I think, generally use pretty fair-sized guns for upland plover (*T. bartramius*). I find my little Parker has to be held close, but kills as clean as any gun I ever owned.

While at Plum Island last fall I met a party from Gloucester. They all had heavy guns, 10-bores and one 12-bore, weighing 10 to 11 pounds each. Sport ran quiet, so we shot at targets. All their guns and my own were shot from rest, same distance, same man and same sized target. In charges they used 4½ powder, 1¼ shot, No. 8 and No. 4. I used 2¾ of powder and 1 ounce of shot No. 8 and No. 4. One of them beat me only once. I beat it twice badly, another three times, and the third twice. These guns, I presume, are in the hands of their respective owners, Mr. Frank Gaffney, Mr. Abbott Coffin, Mr. Marchant and Mr. Rowe. I think that to-day I should take a 16-bore were I going again to the Arctic. Raymond Lee Newcomb.

Salem, Mass., March, 1884.

Editor Forest and Stream:

A common 10-gauge gun of Parker's, which I targeted on Jan. 27 last, with following results: My targets were 24-inch. Distance 45 paces, as long as I could take (which is at least 40 inches), and shot against a heavy wind blowing from over an immense marsh: No. 10 shot, right-hand, 276; left-hand, 265. No. 8 shot, right-hand, 165; left-hand, 119. No. 6 shot, right-hand, 91; left-hand, 85. Charge used, 4½ powder, 1¼ shot, 2 wads on powder, 1 on shot. G. H. W.

Toledo, O.

Editor Forest and Stream:

His shotgun—killed a buck with it 120 yards—the charge was one dram of powder and thirteen buckshot. With "Ogeechee" to tell it for the muzzleloader the breechloader must stand back. Send "Ogeechee" first prize next time. The cold spell I fear has about used up the quail here. Our shooting was very poor last fall. A bill is before the Ohio Legislature to protect squirrels between January and June. May it pass. W. H. H.

Wauseon, Ohio.

Editor Forest and Stream:

With me it is a settled question that a breechloader is the gun; also, that for all kinds of game, large or small, a 10-bore is the thing. I have never seen a 12-bore that could hold its own, everything considered, with a 10-bore. If that is not so, why are the 10-bore barred, as Mr. "N. E. W." writes? Let us hear from parties that have used both bores, 10 and 12 gauge, and that bag game and learn which will kill the cleanest at long distance, both large and small game. I use a 10-bore and have friends that have used and owned both, and they all say that a 10-bore will kill cleaner at a long distance. Let us hear from those that have used both, and that are not prejudiced. New Subscriber.

SHOOTING IN MEXICO.

PERHAPS a word from this "land of God and liberty," of the Montezumas, of the Aztecs, and of Mañanas, may not prove wholly uninteresting. This city, Monterey (or King Mountain), lies in a beautiful valley entirely surrounded by mountains, the principal of which, or rather the most widely known of which, is the Saddle Mountain, from its close resemblance in shape to a Mexican saddle. Distant from Laredo, Tex., about 165 miles on the Mexican National Railroad. It is the capital of the State of Nuevo Leon, and has a population of about 50,000. Some 500 Americans do business and reside here, principally German-Americans; climate perfectly delightful. Game—quail, jack rabbits, cotton tails, ducks, deer, wild hogs, wildcats, Mexican tigers and cougars, all found within three leagues of the plaza. A strange country this; you never see nor hear of a sportsman, seldom see a dead quail (you can buy live trapped ones in the market); occasionally a greaser rides in with a deer, but about the only sign you see of the existence of this game is on Sunday morning. Then you see a dozen different Mexicans hawking the hides of wild cats, wild hogs and deer, with occasionally a fine specimen skin of the tiger and cougar, or Mexican lion, as it is called. I have the pelt of a deer shot by me here two months since that measures exactly seven feet long. Is not that more than the average? All the deer here are the blacktail variety.

Of late I have enjoyed (save for the want of a fellow sportsman) this fine shooting ground. I have a fine Irish red setter bitch, Vick, and at my rancho, adjoining the city, can bag any day thirty to fifty quail with a couple of braces of rabbits. My grand old dog Pete (his like will never be seen in Mexico) died three weeks ago of throat disease. Shooting here would be a paradise but for the warm weather. We rarely ever see a frost. The undergrowth is rank, intensely so, and what with prickly pears, sand burrs, thorns, mesquite, etc., it is almost a "cruelty to animals" to hunt a setter here. Above here, say ninety miles, at Saltillo in Coahuillo, it is much cooler, with more open land, a grain country, and I am told it is full of quail. Of this more anon.

This week I have bagged in one day thirty-five quail, one teal, seven rabbits and thirteen doves. Not bad for Mexico, is it? Duck shooting is good here almost any cool day on the water courses.

I have all the outfit a sportsman ever wants in any country, and would gladly welcome any sportsman from the United States and do my level best for him.

Are you fond of mocking birds? Verily this is their Eden. Bird and cage for fifty cents, Mexican money, with 18 per cent. discount thrown in. One five years old is singing above my head so beautifully this moment, as if to say, "Don't forget me." Don Carlos.

Monterey, Mexico.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

Among other things I desire to call attention to a new cartridge, which, as I am indirectly informed, is soon to be put upon the market.

I do not think I am the only one who will favor its introduction. The cartridge referred to is of .45-caliber, and will be loaded with 115 to 120 grains of powder and 350 grains of lead. This, in my present opinion, would be greatly in advance of anything yet made for hunting purposes. With reference to this cartridge I would invite the opinion of some of your correspondents who have already given us the benefit of their views upon other subjects pertinent to this discussion.

"Greenhorn" early in the discussion, "Prairie Dog" and others have already demanded a cartridge somewhat similar, and I have small doubt that it will meet with almost universal approval.

My predeliction for the .40-caliber is not so great that I cannot recognize the advantages claimed for other calibers, nor will it prevent me from adopting a larger caliber, if, upon good and sufficient reasoning, it can be shown me that it is better adapted to game shooting. After all, my preference for the .40-caliber may be founded more upon individual taste than upon any better reason. The results which would probably be obtained from the use of this .45-115-350 I confess, I think, would be in advance of anything obtainable in a .40-caliber cartridge. This proportion—something more than 3 to 1—should give a very flat trajectory, and yet the bullet is of a weight which would, when impelled with a high degree of velocity, give penetration and bone-crushing effects sufficient to satisfy the most exacting, especially if a hard, solid bullet is used, or one with a very small hole, tapering to a point at the bottom, and extending one-half its length, as described by Mr. Van Dyke. His suggestion that in every box of cartridges, one-half be loaded with solid bullets and one-half with hollow-fronted bullets, is an excellent one. In this way not only could every one be suited, but all could have an opportunity of testing for themselves the efficacy of the hollow-pointed bullet.

For every kind of game possessed of less vital power than grizzly bears, or buffalo and like large animals, this cartridge, in my present opinion, would be very near perfection; even for these it would be considered sufficient by many. This is very nearly the charge used by "P." when he made such havoc among the grizzlies, killing upward of twenty in a single season; for, if I am rightly informed, he used at this time a .45-caliber rifle, with 100 to 110 grains of powder and 344 of lead.

Now comes the question, shall this charge be put in a straight or in a "bottle-neck" shell. Personally I am in favor of the straight shell as being simpler, stronger, less liable to burst and productive of less recoil. Were I accustomed to use single loading rifles I would strongly urge that it be put in a shell of this shape. But as I favor the use of a good repeater as being less "cruelly wasteful of game," all things considered, I am met with the objection that in this form the cartridge would be entirely too long, at least 3½ inches, for use in any repeating system using the lever underneath.

Very regretfully do I make this assertion. The arc described by the lever would be so long that it would be impossible to pump it with the gun at the shoulder. A 2⅛ inch cartridge is about the maximum length for comfortable use in a repeater of lever action, and this is rather too long. Now one of two things must be done, either invent some repeating system which will not be open to this objection, and which can be as conveniently and easily worked as those using the lever action, or reduce the length of the shell. The only means of reducing it to the desired limit, and maintain the same charge of powder and lead is, of course, to make the shell "bottle-necked."

Therefore, on behalf of all wedded to the use of repeaters, I hope that the above charge or one approximating it may be put in a shell of this description. But I would advise all to be careful to see that the shell fits closely and exactly the entire length, especially at the shoulder, at which place it is most liable to burst if there be an unoccupied space between the shell and the chamber. If, however, the rifle be properly chambered, so that the shell fits snugly and evenly throughout, the danger of bursting or sticking may be readily avoided.

Of course the recoil of this cartridge would be rather severe, especially if it be bottle-neck. Fortunately there is a way of overcoming this objection. Should such a cartridge be made and a repeater adopted to its use, I would recommend the use of some good permanent (not adjustable) recoil pad. There are several of these, particularly the Silver pad and the elastic heel plate, invented by Piffard, recently described in these columns. These, though they do not abolish the amount of recoil, would reduce its contusive force, or sensible effect, about one-half. By the use of such a contrivance I do not think the recoil of the proposed .45-115-350 would be more disagreeable than that of the regular service ammunition .45-70-405.

It is wrong to speak of the "unmanly fear of a little recoil." I think that the majority of men who do any amount of still-hunting will be found of physique sufficiently tough to enable them to stand up against considerable recoil, when the rifle is held properly. But excessive recoil, while attended with no serious physical injury, is productive of a very serious mental one, which is this: In a short while, one who uses a rifle which recoils greatly, becomes in a certain sense afraid of it, and involuntarily flinches when he pulls trigger. Bad shooting is the invariable consequence. I have known men to swear that they did not flinch, yet distinctly saw them do so, showing that it is wholly involuntary and does not proceed from any actual fear of the recoil. Especially is this true of men of nervous temperament.

So I have known men to make better shooting at game than they could possibly do at a target, with a rifle whose recoil was very heavy, for the reason that in their excitement the small item of recoil was entirely forgotten.

The reason I at first demanded the use of the 500-grain bullet in a .40-caliber repeater, was that I might have a cartridge with weight of lead sufficient to use against the largest and toughest animals on the continent. For all smaller game, by cutting down the bullet, I could easily have used more powder and less lead, as desired. I am convinced now that I was wrong, for the simple reason that this cartridge cannot be made short enough for use in a repeater of lever action, except possibly by those whose arms are of unusual length.

So also I see no reason why this proposed shell could not use a heavier bullet if desired, say one of 500 grains. In order that the cartridge maintain the same length as in using the 350 or 325 grain bullet, the former would necessarily extend further into the shell and beyond the shoulder, displacing something like 15 to 20 grains of powder. Greater penetration and energy—terms here nearly synonymous with higher trajectory—would be the result. Would there be any objection to this because of a certain amount of powder surrounding that portion of the 500-grain bullet, which in this way would extend beyond the shoulder? I should think not, unless, perhaps, that the fact would be productive of additional recoil. So also less lead than 350 grains could be readily used by the substitution of a bullet of the desired weight and character. The difficulty which might arise from the confusion of these different kinds of ammunition might be avoided, as before pointed out, by employing different colored shells or primers.

If it be found that this cartridge will be too long in .45-caliber even when bottle-necked, for use in a repeater of lever action, then let a cartridge be made in its stead, which, while maintaining nearly the same proportion of powder to lead, will contain 105-110 grains powder and 325 grains of lead. Without doubt this can be brought within the limit of length.

Mr. Duane has anticipated me in calling attention to the fact that as we increase the diameter of the bullet it meets with proportional atmospheric resistance, a fact seemingly lost sight of when the broad statement was made by your correspondent, Mr. Van Dyke, that the only possible way to give a ball weight without cutting down its velocity is by "widening it."

High initial velocity is not so much what we want as a high degree of velocity combined with energy within hunting ranges, say 200 yards.

I should much like to be told in some such tabular form as Mr. Duane has been kind enough to furnish us, the results following experiments with a certain charge, *e. g.*, 100 grains powder and 300 grains lead in the three calibers, .40, .45 and .50.

I am inclined to think that with an even start in a 200 yards race, while the .50-caliber bullet might start the quickest and lead at the first fifty or one hundred yards, the smaller .40-caliber bullet would win, and be less "winded," *i. e.*, have more energy left to go much further, if necessary. What we all want is a rifle which, while convenient to handle, will accurately use ammunition which will give enough penetration and bone-crushing power to always reach the vitals, and break whatever bones it encounters and will in addition give a trajectory so flat that the bullet will not fall more than six inches in 200 yards.

Though the proposed cartridge, .45-105 to 110-325, may fall somewhat short of this result, I feel sure that its introduction will be considered a good long step in the right direction. I am glad Mr. Duane has demonstated so clearly the two important conditions of accuracy and energy which, the latter especially, seem to have been somewhat lost sight of in the anxiety to get flat trajectory. I cannot as yet agree that for all-round work a bullet of less than 300 grains has enough of this quality of energy. Individual instances may seem to prove the contrary, but in the long run I am quite certain that a 300-grain bullet (I like one with 25 or 50 grains added to it even better) will prove more satisfactory than a much lighter one. Now pile on all the powder that the rifle and the man shooting it can stand, and do accurate work.

To illustrate: Although in the very large majority of instances, 250 yards is outside hunting range (it will be found to be somewhat less in the East), I have killed two bull elk, either of which was considerably over 500 yards distant, and upon ground considerably higher than that upon which I stood or rather laid. I cannot think that some of the light express bullets which have been advocated, or even a round ball, would have been so effective, even if I had been able to hit the game with them, because much more of their energy would have been lost than was the case with the heavier solid bullet, their staying power would have been less. Don't imagine that either of these elk was hit by the first shot, or the second or the third.

I confess to a considerable amount of surprise in reading

Mr. Van Dyke's sweeping denunciation of the .40-caliber, and those who favor its use. Even admitting that the caliber is not sufficient for all-round work, and that we are mistaken in its adoption, I cannot think that it is so to an extent which merits this wholesale criticism. It would seem that when his pen, which has written many good things, and given much valuable advice, wrote this, he was possessed of a certain amount of that same illiberality which he so severely criticises in others. It is hardly possible that he has given it a fair trial upon game, and I cannot escape the conviction that his objection is founded more upon theory than practice.

As I have before said, very possibly, nay, certainly, there may be better charges, better ammunition than we have at present. And moreover, I am perfectly willing to be shown that these will find best result (sufficient accuracy and energy with the flattest possible trajectory) in a larger caliber, and that, therefore, I am wrong in using and advocating a .40-caliber rifle, but not before I have said something in defense of that which is at present at least my favorite. Nor would I be a sportsman if I did not repell the insinuation that I and all who use a rifle of this caliber are so fond of spilling blood that the crippling and wounding of game is a matter of no consequence to us. Being thoroughly convinced from a somewhat extended experience that I am not that "demi-god" he properly refers to in such sarcastic language, and being tolerably well acquainted with many of the "eccentricities of lead," I feel that I am at liberty to take up the gauntlet flung down by him, and risk impalement upon the points of his propositions. He asserts that he who uses a .40-caliber solid bullet must necessarily be understood as saying that—

"First, he can hit his game just where he chooses; or,

"Second, that a ball is just as effective in one part of an animal as in any other part; or,

"Third, that the crippling and torturing of game is a matter of no consequence."

As regards the matter of accuracy and being able to hit within ".87906 of an inch" of the precise spot where it is desired to plant the ball, or to place it in the "heart of a bounding deer," let me say that, in my belief, the man who can, under all the varying circumstances likely to arise in hunting, hit within a foot of that particular spot when shooting at game standing over 100 yards distant, or within three feet of it when shooting at running game at that distance, is a better shot than the large majority of men with whom I have been brought in contact, at least, who use any sort of a hunting rifle.

A man who is able to hit a fifty-cent piece six times out of ten at 50 yards, will often miss a deer standing broadside at 75 or 100, and apparently there is little if any, more excitement in the latter case than in the former. "The ever-changing conditions of ground and light," the inability to tell just how the deer is standing, the fact of being "blown" from a hard climb or run, etc., etc., are factors which cause misses which are often so bad that, hearing of them, many a "target" shot would laugh heartily, and assure himself, if he did not declare it, that he could never score such a miss. But I have had the good luck to see them come sadly to grief when attempting shots even easier than that the possibility of which they ridiculed. Now, I have known many hunters, aye, good sportsmen, too, who prefer the little .40-caliber to any other, as being best able to assist them in bringing their game to bag.

Will your correspondent answer me why it is that so many of the pelt and meat hunters of the West, whose opinion upon a subject like this is certainly entitled to great weight, favor this caliber? It is simply because they find that it enables them to ply the abominable profession with the best results, and that they make a better livelihood by its use. It would seem to me that a bullet of this description, which is so great a favorite on the buffalo range with old hunters, would generally be found to be quite sufficient for animals so much smaller and possessed of so much less vitality as deer and antelope.

I do not doubt, however, that better results follow the making the bullet expansive, as suggested by your correspondent "D. McG.," when the shooting is to be confined to animals of this description.

The second proposition is of course preposterous and unworthy of consideration.

As regards the third, let me ask your correspondent which is the more cruel, to shoot an elk or a buffalo—for this discussion is not confined to deer alone, but extends to all large game on the continent—in the haunch with a light weight bullet of large caliber, or an express expansive bullet which will flatten out (if it does not go into splash), or to hit him in the same place with a 370 or 500-grain solid bullet of .40-caliber?

Neither of the former will do more than reach and probably fracture the bone in a majority of cases, making a larger surface wound, while the latter will rarely fail to have "energy" enough not only to crush the bone of the hip, but also to find its way to the hollow. Unless the artery be cut, in which case does he suppose the animals would longest survive the injury?

Let us suppose a "Plains" scene. Two men on foot, about equal in their ability to hit game. One armed with a .40-90 Sharps, and the other with a .50-caliber Winchester, suddenly find themselves close upon two buffalo bulls. The buffalo turn and run; one takes the left buffalo, and the other the right.

When the firing has ceased and the smoke cleared away, let us look at the result. One buffalo is down, the other, wounded in a number of places, making his lumbering way across the plain to furnish food for wolves after two or three days of painful existence. Little need to ask by which rifle the bull on his side came to be there.

I mention this case because I know that the result would be much the same in all such tests and, also, because the facts are very like a page out of my own experience.

He, of the Winchester, having tested it upon this and a large number of other occasions and "found it wanting," was very anxious to change it for the .40-caliber.

It is only fair to say that his cartridge was not loaded as Mr. Van Dyke recommends. I have no doubt that he gets excellent results from his method of loading in shooting deer; but, though they might have proved somewhat more satisfactory, I do not think the results would have been materially different in shooting larger game, unless, perhaps, the bullets were made solid and very hard.

It is proportionately, of course, more difficult to drive a light ball presenting a large surface into flesh than a heavy ball presenting a small surface.

On the other hand I thoroughly appreciate the force of the remark made by "D. McG.," that when using the .40-caliber solid ball it often took him longer to find his game after it was hit than it did to look it up in the first place.

This, of course, is the great objection, and great annoyance and vexation of spirit is apt to follow the shooting of an animal "a little too far back." I grant it is much more gratifying to see plenty of red evidence of your work on the trail, but I am not yet willing to concede that the bullet which makes a great surface wound and does not penetrate, is so surely and so quickly productive of death as that which always makes two holes in the hide. It is a sad thought to one who has any of the humane sentiment of the sportsman in his composition, to know that he has shot an animal through the paunch, and that the afflicted beast will live for hours and sometimes days, suffering intensely.

Give me a formula for driving the irregular flattened express bullet clear through bone and tissue, and also show me the rifle of a large caliber which is as handy to use and as convenient to carry, and also teach me how to shoot it with as little discomfort to myself and as accurately as I now can do with the smaller caliber, and I will adopt it at once.

Let me instance an example where I went to the other extreme. Before going to the Rockies on a prolonged trip I had Lefevre make me a double-barreled 13½-pound rifle, chambered to shoot six or seven drams of powder and an ounce and a half of lead.

I naturally expected great things of this rifle. In fact I was induced to purchase it from the fact that one of your correspondents had a similar rifle by the same maker. Probably the charge which I used—generally 155 to 160 grains (1¼ ounces) lead—was wrong, probably the sights were not so good as some others, probably it was not quite accurately or correctly made, since the balls seemed to pursue divergent courses or fly wild when the rifle got at all dirty, and it fouled very much after two or three shots.

As to the results I am quite positive it kicked tremendously, seemed to weigh a ton after a hard day's tramp in search of elk or sheep, and above all I was never able to do good shooting with it. I am quite willing to admit that when that solid ounce and a half ball struck anything, the paralyzation which followed was most satisfactory. But I missed very often when I am certain I could have killed with a .40-caliber. The result was so unsatisfactory from the use of the hollow-fronted ball that I soon gave it up.

I was very sorry not to have had the opportunity to use this rifle with about 120 grains of powder and a round ball. The truth of the whole matter is that in loading our ammunition or selecting a rifle, we must be greatly influenced by the character and variety of game we are likely to encounter, and the probable range at which most of the shooting is to be done.

But I feel quite assured that a good repeater, and one which is not liable to get out of order, adapted to the use of this proposed .45-115 to 120-350 cartridge, or if this prove too long, the .45-105 to 110-325, will be the best rifle for extended trips to those localities where we do not wish to be encumbered with more than one rifle, and want that one easy to handle and to carry, and where in a week we may possibly shoot at six or seven kinds of animals, including some of a dangerous character.

I confess that I am dissatisfied with the rifles I have at present. What we want is a rifle which one will not soon wish to exchange for something better. If we are so fortunate as to get this, let us use it exclusively and get to thoroughly to know its disposition, its capabilities and its faults. There will arise a confidence in it and a love for it which will not only give us additional pleasure in its possession, but will very greatly assist our shooting. For that confidence in it, that feeling that "the gun will do its duty," does as much as anything else to insure good shooting at game. In fact, it seems to render the eye truer and the arm more steady, and it certainly greatly enhances the sport of stalking.

Then if one misses there is a half-ashamed feeling that he has not done his part. One cannot escape having a feeling of friendliness and affection for a gun that has served him well, and has never betrayed his reliance in it. Sentiment aside, it is at least a source of great satisfaction to know that a bad shot cannot be charged to the fault of the gun, and that one must look elsewhere for the cause.

After all I am compelled to think that correspondent who intimated his regret that the breechloader had ever been invented and that the muzzleloading rifle was a thing of the past, more nearly right than any of us. Were this the case, there would be plenty of game left within easy distances, and the sport would be in every way more satisfactory. For as we all know the greater difficulties there are to surmount for him who has the courage and patience to persevere (the crucial test after all, and the rock upon which so many would-be sportsmen go to pieces), the harder he has to work for a shot the keener the enjoyment in bagging the game at last. So on the other hand it is very easy to become surfeited with too much killing.

When the game is easily found and more easily killed, it is no longer sport, and the manly art of stalking becomes butchering. Oh that many who yearly visit the Rockies in quest of slaughter could see that in this way they are killing the goose that lays for them the golden egg, and be taught that there is really much more enjoyment in following a herd of elk or sheep all day to finally get a good shot at and kill an old bull or ram, than in banging away indiscriminately as soon as within range, piling up half a dozen cows and calves, or ewes and lambs, as the case may be. But no, it is blood they want, and blood they get, but not all of them, thank heaven! A little while and there will be no game left where it used to be most abundant. Between these sportsmen (?) and the nefarious hide hunter the slaughter will soon be complete. But this is an age of progress, and I suppose we must bow to the spirit of the age.

While every true sportsman must admire the picture of our old friend "Nessmuk" clinging with fond tenacity to the use of the faithful old muzzleloader, which has served him so long and so well—and, as we all hope, will continue to do so for many years to come—I am of clay much too human not to covet something better than that which I now have, when that something can readily be had; nor do I wish to feel that I am handicapped by the fact that my rifle is not so good nor so effective as my neighbor's. I wish to be as fully and as well equipped as he. I would greatly like to soar above this, but I cannot. So, as in the good old days of the muzzleloader we would have wished to have the best that could be made, I now, in the days of the improved breechloader, have the same desire to have the best; and, having obtained it, indulge the comforting reflection that I am not obliged to admit the fact that my companion is happy in the possession of a rifle better than my own.

I fully agree with your correspondent "Greenhorn" in his preference for a butt plate similar to that used on the Springfield army rifle. I have also used the shotgun stock on hunting rifles with great satisfaction. With a butt plate of the shape of either of these, a rifle can be readily and quickly brought to the shoulder and be firmly held in proper position, especially if it be provided with a rubber heel plate, since the rubber will not allow the stock to slip from the arm as readily as the iron plate. A stock with a butt plate resembling that of the old Kentucky rifle is a nuisance. I am surprised that there has not been more discussion with regard to the effect of the various methods of rifling upon accuracy and energy. D. M. B.

PHILADELPHIA.

Editor Forest and Stream:

I am watching for the evolution of a perfect rifle out of all these "hunting rifle" articles in your paper. In 1872 I fired a Winchester rifle 1,250 times without cleaning it. Then the charge was only twenty-five grains of powder, but I found it heavy enough for moose, caribou and bear in Canada, and brought down several. Of course, a heavier load would be much better, but can't we overcharge a rifle as well as a shotgun? MANHATTAN.

NEW YORK.

A TAXIDERMIST'S VIEW OF IT.

Editor Forest and Stream:

It is not without years of consideration to strengthen my convictions that I offer the following remove from public opinion. I would further ask the careful and unprejudiced consideration of my statements, and now, while the subject of bird laws is being agitated, seems to be a fitting opportunity.

The time to shoot birds is in the spring and not in the fall. If the birds were shot at this time (spring) only, they would be far more abundant than at present. Let us begin with the ruffed grouse or partridge, and see how this change will operate in his case. The law at present is taken off Sept. 1, and the sportsman is not slow to begin hunting. The flocks of young grouse are inexperienced, and often but partially grown, and are cleaned up close with but little difficulty. Suppose these birds were left until January and then the law taken off until April 1, they would become as shy and difficult of capture as their parents, and a few years would find them a far more abundant bird than at present. The same would be the case with the quail, while for the woodcock a decided advantage would be gained. The woodcock arrives early, and could be shot until April 1, when the birds arrive that will breed with us. The summer shooting is fast annihilating this species, and it is getting to be a scarce bird in thickly settled districts. And this is not to be wondered at, when a sportsman locates a pair of birds, and on the 4th of July cleans them up and their young also.

But if we are to have any shore birds a few years hence, the summer and fall shooting must be prohibited. The former in particular is very disastrous to the species that return leisurely, and they are killed with but little difficulty almost as fast as they appear upon the marshes they frequent. In the spring it is different; the birds are then en route for their breeding grounds, and are much more shy and difficult to get at. They do not linger so long as in the summer or autumn, and although good bags are often made, yet the slaughter cannot compare with that made during these seasons. Besides all of this, there is more satisfaction in having a few spring birds than a quantity of fall ones, if one has any eye for beauty.

With our small birds the case is not different, as those know who make collections of them. It is a wise provision also that of most of our bright-colored species the males arrive first, and the best plumaged in the van, and are the individuals going the furthest north. The golden rule for all collecting is, take what birds are wanted while the migration is in progress, but as soon as the individuals appear that breed with us let them alone. If this rule is adhered to, no section will be depopulated or any decrease noticed. But few if any birds should be killed from June 1 to Sept. 1.

The decrease of small birds noticed in many localities is almost wholly on account of the shooting of resident birds. If, for instance, any of our common robins are wanted, let them be taken in March while passing by in flocks, but early in April those come which sojourn with us, and if these are not disturbed robins will not grow scarce from the shooting of them. The first to come are those which are to distribute themselves in our northern country, and a missing bird here and there will make no difference. But a man or boy can seriously impair the number of robins in a locality by shooting them between April 1 and September 15. There are birds enough for all who wish if they will use and not waste, and temper this destruction with a regard for natural laws.

The taking of birds' eggs is considered by many worse than the killing of the birds; but this is not so. I know of no birds which will not make at least three or four attempts to rear their brood before giving it up. But I would severely denounce the killing of the parent birds from the nest unless in exceptional cases, or when absolutely necessary for positive identification. If the places where birds are breeding in large numbers are not visited by the shotgun as well as the eggers, and the latter will confine themselves to the taking of the eggs twice only, and not trouble the third clutch, little if any harm will be done.

The preceding remarks, if lived up to, are practical. The author loves the birds, and does not like to kill any for which he has no use. If birds were only killed for some purpose and not merely for the sake of seeing them drop dead, the laws would need but little enforcement.

One more point, if gained, will do much to protect our beautiful birds. Our (protective) tariff on bird skins is directly antagonistic to our bird laws. Let us look at it. All of the States have laws for the protection of small birds, and the killing of them is stopped in every possible way, if they are to be used for millinery, and at the same time a duty is imposed for the protection of the same industry here. Birds, and of bright colors, too, are collected extensively in foreign countries, and sent into Great Britain free of duty. If those birds were allowed to be brought to this country free also, they would be imported at prices that would defy our collectors, and if that was done would it not largely protect our small birds? F. J. TINGLEY.

[This is only saying that instead of killing our own birds we must kill those that are passing to States north of us.]

V. C. BARTLETT, proprietor of the Sportsmen's Home, Saranac Lakes, N. Y. (the oldest hotel in the Adirondacks), died at Keeseville, N. Y., on the evening of 27th of February. His hotel has long been regarded with peculiar favor—was most home-like, and has always been for years liberally patronized by well known anglers and tourists. He will be greatly missed.

DO THOU LIKEWISE.

WE are having a very severe and protracted winter here, and I fear the few birds left over by the shooters are having a hard time of it. My shooting the past season has been more varied and over a larger extent of country than any heretofore, commencing at the foot of the Rocky Mountains on September 3, in the Northwest territory, and ending on February 23, way down in Tennessee. My first bag of the season consisted of sharptailed and ruffed grouse, duck and snipe. My last of quail, woodcock, snipe and rail, and of this I will give a short account.

I had gone to this point a month previous with three of the greenest puppies in the field that could be imagined, neither ever having pointed a bird, and scarcely knowing their names when beside you, and when a short distance off not at all. I knew they would hunt and were brave, and going there to break them, cared for nothing further. The morning was lovely, with the sun out bright and warm, and the slight frost of the previous night had entirely disappeared when I started for a large field, two miles distant from my stopping place, which I knew contained birds from previous acquaintanceship with it and them. I was accompanied by Knight, a setter, a grandson of Rob Roy, Druid and Doll, and greatgrandson to Carlowitz, and Shot, a pointer of obscure but worthy parentage.

In entering the field the dogs were cast off to hunt out a large sedge patch on a hillside, facing the sun. Knight, to the right, went off with a dash, and wheeling quickly, with his head high in the wind, walked up a few steps and became rigid, Shot backing him firmly off to the left. I knew the birds were moving from the action of the dog, and walking on in front of him, flushed the covey wild, bringing only one to bag, the balance dropping in a thicket a short distance off. After retrieving the dead bird, I turned to follow one I had marked down, and missed Knight. On whistling for him without response, I went back to look for him, and found him fast under the hill on another covey, near the place where he found the first. On flushing those, I got a brace, and marked a part of them settle by a fence on the course I meant to beat. I then returned to the location of the first which I had marked down in a brier thicket. Knight instantly pointed a bird. I crippled it only, and in searching for it, flushed a woodcock, which I got. Shot then pointed another, which I also got. I then left those birds and went to look after another covey, and of these I secured another brace. Their numbers were rather limited, owing to our former acquaintanceship. We then went on toward another likely looking field, a short distance ahead. I had scarcely entered the field, when Knight was again firm, and the pointer rigid behind him. On flushing the birds I got two with my first, and another with my left, the balance of four pitching into a thicket close by. Here the dogs flushed two; one I got, and the other I did not get, and passed on to another field. In this the pointer accidentally flushed a covey, and marking them down, I got beautiful points from both dogs, getting two birds and missing, as my old mentor used to say, other two, most inexcusably. Knight then found, in an adjoining field, a beautiful specimen of the rail family which I secured, and Shot immediately after was firm on four quail, Knight backing him some distance off with his head turned back over his shoulder. I enjoyed this performance so much that the decimated covey were allowed to go free.

In going down behind the fence dividing the next two fields to give the dogs the wind, Knight showed much anxiety to get over, and when taken over at the lower end and cast off, made a break at full speed, with his head high up, to a fine covey, and stood them in grand form, directly opposite where he wanted to get over the fence on his way down. I killed one only, missing the second. The balance went down over a steep embankment and across a creek, where I did not choose to follow them, and having as many as I cared about I started for home.

On my way back the dogs made several more points on quail and flushed a snipe, and I added to my bag enough to make a total of fourteen quail, two woodcock, one snipe and one rail; not a large bag certainly, but enough for the space of time occupied in getting it, and for amusement.

JOHN DAVIDSON.

MONROE, Mich., March 7, 1884.

PHILADELPHIA NOTES.

THE game stands of Philadelphia this week show that some one has been down the river and done execution among the snow geese, or that the Smyrna (Del.) market shooters have been more than usually successful, and shipped their fowl to this market, for at almost every poulterer's stand more or less of these geese can be seen hanging up for the first time this season. I took the trouble of making a trip to almost all the game cellars and shops on Saturday, but failed to find one man who called the bird by his proper name. Some (most of them) termed them brant, others bastard goose, and one gull goose. They did not sell at all well, and the pair your correspondent purchased were bought very cheap, and proved most excellent eating. Very few solid white fowl were among them, the majority being clad in the sooty white garb of the young bird. On inquiring where they came from, I was always answered, "Down the bay." Since the late snow fell, trapping of crows for shooting matches has been extensively going on at Bristol, Pa., and the netters have been very successful. A number of crow matches were shot during the week. Any quantity of these sable birds may be bought now for ten cents apiece, but after being caught for three or four days they become weak and do not fly well. In fact, at their best they are slow and make poor shooting from a trap, oftentimes having to be thrown into the air before they will take wing. Much floating ice is in the Delaware River at this writing, but the ducks, which were so plentiful before the present cold change in the weather, have decreased in numbers, and appear to have gone further down the river.

The shooting at Havre de Grace flats this spring thus far has been a total failure. Gentlemen I have talked to who own outfits there attribute it to the scarcity of feed, others to the bushwhackers. The truth is, however, that it is only a question of time when box or battery shooting will entirely destroy the duck shooting of a section where it is practiced, notwithstanding it may be allowed every other day only. In every instance in this sport the battery must be from necessity anchored directly on the feeding grounds where the water is shallow or of moderate depth, and the ducks become alarmed by the great number of "machines" laid out where they wish to alight. Box shooting in the fall and winter is bad enough in its destructiveness, but in the spring it is worse. I heard a very intelligent correspondent of FOREST AND STREAM state a few days ago, that in these breechloading times it would be only a few seasons more when it would not pay to own a battery outfit, so alarmed and timid were the fowl becoming. He is a part owner of a scow and double box, and takes every opportunity of using it, and is capable of knowing whereof he speaks. HOMO.

PENNSYLVANIA GAME.—Centralia, Pa., March 3.—When "snow bound" and shut in from the woods I have been greatly interested in the social chats in your paper. I listen to the speakers as they speak up from the "Rockies," from the great North Woods and from the orange groves. I wonder as I hear of bags filled without hardly a miss, and am pleased as I hear now and then one, as he tells his experience, admit that often the cunning grouse and quick-winged quail are too smart for his eye and his finger. I am pleased because I am on the same bench. Up here among these mountains—spurs of the Blue Ridge—we have not much game, although on the "Little Mountain," four miles north, there are several flocks of wild turkeys, and in the deep ravines lying among these hills a few deer hide away. In the Roaring Creek Valley, lying some ten miles away, during last autumn I had several days of grand sport among the "Bob Whites." I am afraid this cold winter and its deep snow has been too much for them, although many of the farmers I have prevailed upon to feed them. If they all winter through we shall have a great many birds the coming season. —SPICEWOOD.

MICHIGAN NEEDS A BOUNTY ON WOLVES.—The Marquette *Mining Journal* reports: John Spicer made a visit to Mud Lake, recently, and reports finding the carcasses of five deer that had been killed by wolves. Only a very small portion of each had been eaten. He stated, however, that deer in large numbers were "yarding" (staying together) near there, and that the wolves hang around, so that when they feel in need of something to eat they kill a fresh deer and take their meals warm. Something should be done to protect deer from the ravages of wolves, and, as there is but one thing to do, and that is to kill the wolves, enough bounty should be placed on them to make the job of eliminating them a short one. Every year there are hundreds of deer driven over the Pictured Rocks by these hungry pests, and are, of course, destroyed, without satisfying the appetites they fled from. Mr. Spicer said that he found twelve dead deer very close together, two years ago, that had perished in this way.

FISHER'S ISLAND CLUB.—Hoboken, N. J., Feb. 22.—*Editor Forest and Stream:* The Fisher's Island Club has received the second shipment of Western quail, about one hundred in number, in good condition. More birds are to arrive shortly and we hope the full number contracted for will be reached. We have heard from the farmers on the Island that there has been hardly any snow there this winter, and the weather much milder than on the mainland. We will liberate the birds within a month from now or as soon as the full number of birds has arrived. The New York *Herald* reporter was decidedly off when he claimed we would stock the lakes with fish as food for ducks, etc. Black bass would be an expensive diet for them.—MAX WENZEL, Secretary.

HUNTING ON THE SABBATH.—When so-called sportsmen from the North come to Florida, and our little country villages, and spend the Sabbath day in ransacking a man's land, with his guide and dogs, for game, it is about time that steps were taken to prevent it. Yesterday Northern men were banging away within less than two hundred yards of a meeting-house, where services were being held. It is a disgrace for sportsmen to hunt on Sunday; if they care not for the laws of God and man, they ought to have respect enough for our residents to do their hunting on week days. True sportsmen will not take pleasure in disobeying Sabbath laws, unless while out on a camp hunt, away from settlements, and in need of food.—RED WING (Glencoe, Fla.).

CAPTURED WHITE DEER.—Johnsontown, N. Y., March 9.—An old guide from the Lake Pleasant country has reached here. He reports that three white deer have been captured alive in that section. Two of these, a large doe and fawn, were extricated from the deep snow, near Piseco Lake, by William Courtney, an old sportsman of the vicinity. The other animal, an adult specimen, was captured in the same manner on the following day by a brother of Courtney. The fawn has since died, but the other two are doing well. They are on exhibition and awaken considerable interest on the part of the guides and hunters, who claim they are the only white deer ever known in that country.—*Morning Journal.*

DISTRIBUTION OF QUAIL IN NEW JERSEY.—Mr. Chas. H. Bernard, secretary of the West Jersey Game Protective Association, states that between Jan. 14 and Feb. 8 he made five shipments of quail, amounting to 306 birds, to the Atlantic county director of the society at Smith's Landing. We would like to hear from Mr. Bernard what proportion of birds purchased for putting out in the five lower counties of New Jersey have thus far lived. Of course the quail have not yet been put out, nor should they be liberated until spring is fairly settled, but it would be interesting to the readers of FOREST AND STREAM to learn what percentage of birds have died and from what State they came.—HOMO.

GAME IN MINNESOTA.—Dodge Centre, Minn., Feb. 28.—I should be very glad if some one would give some hints on duck and goose shooting, as they will be plenty here in a few weeks on their way to the north. Pinnated grouse, or prairie chickens, are wintering quite well, as we have had no severe storms this winter. Ruffed grouse and quail are scarce. Wolves are plenty, with $7 bounty on them; they live largely on grouse and rabbits, and are hunted but very little.—A. E. B.

MIGRATORY QUAIL.—New York, March 4.—Will you kindly say that any one desirous of importing live migratory quail this spring from Messina, Sicily, can receive information and all particulars as to price, etc., by addressing me.—CARL F. BRAUN (P. O. Box 2,487).

WHERE GAME IS SCARCE.—A Pennsylvania man sends for a specimen copy and explains: "Game is getting scarce here, and think it will be easier to buy a few hunting stories than to try the real thing. However, I hunt."

ARKANSAS.—Evening Shade, Feb. 26.—We lost no quail by the cold this winter. Deer and turkey are plentiful and in fine condition.—J. G. S.

WE HAVE received from L. C. Smith, Syracuse, N. Y., an illustrated catalogue of the Baker guns made by him.

Camp Fire Flickerings.

"That reminds me."

106.

DEAR D. B. has gone to his rest. He was the mentor of my boyhood in all that pertained to the use of the gun and the love and pursuit of the sports of the field. He was an excellent wing-shot in the days when wing-shots were few in number.

One day when he wished to go quail shooting his own gun was away, undergoing repairs. He borrowed a singlebarrel gun of a neighbor. This gun had been a flint lock a century ago, but was at the time altered to a percussion. It had the wealth of barrel that is now only seen in the guns made long since by the Arabs. My dear old mentor shouldered this gun, was gone for some time, and returned without any birds, an unusual occurrence. "What!" I exclaimed, "no birds?"

"No," in a solemn voice.

"Did you not find some?"

"Yes."

"Well, why didn't you bring them home then?"

In the same solemn voice, and with a face equally solemn, he replied:

"I put up one covey, but my gun was so long that the muzzle was far ahead of the birds; so I turned round and ran back some distance so as to get the muzzle behind the birds, and when I thought that I had accomplished that end I faced about just in time to see the birds settle between me and the muzzle, so I gave it up and came home." M.

Sea and River Fishing.

THE BEST COLOR FOR LEADERS.

Editor Forest and Stream:

Recognizing the justice of the point made by your correspondent in your issue of the 14th ult., in regard to the color of gut leaders, I have undertaken to make a few trials, proceeding as follows:

Selecting first a cloudy and dull day, then a bright, clear one, I next filled my bath tub with as much water as it would hold, and having prepared a number of pieces of gut dyed a variety of hues, all more or less light, proceeded to look at them by placing my head under water about twelve inches, if not more, and passing the pieces before my eyes as near and as far as I could discern them. This was tried facing the light, then with my back to the window, but always taking care the gut should not be in shadow.

I used Ridgewood water, which was clear, yet at a distance of twelve or fifteen inches only the very dark gut was discernible, while such as were of a dye from a dark color (such as blue slate, drab, and coffee, but in only sufficient strong color to make the gut that particular shade) stood the test very well. Clear, bright colors, will not suit, as they do not diminish the brightness or shine of the gut.

On a bright day, a much lighter shade of the same color must be used, while on a dull day darker shades will answer. I believe the principal object should be to use only such colors as dull the surface of the gut, as by so doing it also prevents the adhesion of thousands of very small air bubbles which attach to the gut and makes it very conspicuous.

In any event, I doubt if the human eye can distinguish any gut through two or three feet of water, while fish must see plainly ten times further, hence the angler, I think, will do well to see, first, the color of the water he intends to fish; next, the sky he will have for a background, and select his leaders accordingly.

For my part, of all the shades used, I select first the coffee stain, which makes the leader the color of slightly muddy water, next a light blue green drab, dulled. These two I shall try as soon as the season opens, and let the creel decide for me. Notwithstanding, I intend making further experiments in both sweet and salt water, as soon as weather permits, and I can secure a brother of the craft, equally interested, to assist me.

I hope others will continue this subject, meantime I inclose samples which tested well, and four showing too much, so you can tell me what the colors are, after allowing a good margin for the color that washed off in the test.

BROOKLYNITE.

Commenting on the above, Mr. Wells writes:

Editor Forest and Stream:

It would decidedly seem the angling column is looking upward. The issue of to-day contains two well-considered and able communications on practical fly-fishing, both of value.

And now further to encourage the hope that the fly-fishermen are, at least some of them, neither so selfish as to wish to keep their "points" secret, nor so indolent as to shirk the plain duty of making them public, comes "Brooklynite's" communication to hand.

Before considering the latter, I would most heartily re-echo "J. G. W.'s" question: "We have all read time and time again of a bass when hooked leaping from the water and falling on the leader so as to break it. How does he do it?"

I had always supposed the age of miracles was past, and that falling bodies, whether alive or dead, were governed by the laws of nature. Again and again have I been staggered by this statement, made in evident good faith. I reiterate the question, "How does he do it?"

And now as to "Brooklynite's" communication.

It would most certainly seem, at the first blush, that to immerse the eye beneath the water and then to look upward, was the surest and most direct way to determine how a leader would appear to the trout; for thus the natural conditions would seem exactly to be reproduced.

But a moment's reflection shakes this opinion.

We all know how sensitive is the human eye to any foreign body, and how instantly the slightest irritation of the exterior affects the action of the muscles which control the focussing power of the lenses within, and whose office it is to form the image on the retina.

We also know that unless these muscles perform their appointed duty, the eye is as powerless to convey to the brain a truthful imagine as is a telescope, the different lenses of which have not been relatively adjusted to distinct vision. We have all, either in frolic or from necessity, tried to see through a pair of spectacles totally unsuited to our eyes, and we all know the result; and this experiment well illustrates the case in point.

Again, though the mechanism of the eye work perfectly,

still so intimate is the relation of its various parts, so profound their sympathy one with the other, that the power of the retina to receive and transmit a perfect image, even were one formed upon it, may well be doubted under such circumstances.

A gentleman well known in angling circles, and an acknowledged authority, told me, when spoken to of the experiments on the color of leaders that I intended to try—an account of part of which appeared in your issue of Feb. 7—that it was all useless; that he had tried it when in swimming; that everything appeared black, and that I could see nothing.

It is clear, therefore, that in the unusual conditions in which his eyes were then placed they refused to act altogether. And that the same was the case with "Brooklynite's" eyes, though in less degree; and that the same will be the case with every one's eyes to a greater or less degree under such unusual conditions, I cannot doubt. In this view I am sustained by a high medical authority, whom I have consulted on the subject.

From his experiments "Brooklynite" "doubts that the human eye can distinguish any gut through two or three feet of water."

If he will again fill his bath tub, immerse a mirror in the water, incline it at such an angle that it will reflect upward any image received by it—say at an angle approximating 45°—and then insert his leaders in the water and watch for their reflection in the mirror, he will have no difficulty in seeing them at twice two or three feet, if the length of his bath tub will permit them to be so far removed.

It is absolutely certain that any image which will form in the mirror and be reflected by it, would be even more plainly seen by the human eye if it was located there and acted in its normal manner. And this, because the loss of light due to the reflection would be saved. Nothing can prevent the formation of an image in the mirror but the absorption of the light proceeding from the leader by the water, and nothing but this cause can prevent the human eye from perceiving an object so situated.

That the eye of the trout is different from ours, is a frequent remark. That it is different in size—different in color, is true. But that it is different in function, different in its relation to the reflection and refraction of light, is a mere supposition, resting, I believe, as at present advised, upon no foundation whatever. It may be more sensitive to light than ours. It may render objects visible to them through a stratum of water, which would totally obscure them to us. But even this I know no reason to believe, notwithstanding the fact that will here occur to every one of the incessant rise of trout long after the shades of evening have fallen, and after we can no longer distinguish our fly upon the water. The difference of background toward which they look sufficiently accounts for this to my mind.

It may be that some of the rays which compose the beam of light may be visible to them, which are incompetent to excite our retina, and of the presence of which we only become aware as they evidence their existence by heat, or chemical action. But if we are prepared to grant this, and I for one can see no reason so to do, it but prolongs the spectrum in one or both directions. It is too improbable even for mere surmise, in the absence of direct proof, that they can see both ends of the spectrum, while the middle is to them a blank. Their every action in reference to the color of flies negatives this.

Light is light. And by its aid all animated beings see, and in its absence all alike are blind. The laws of nature operate equally and invariably both above and below the surface of the water; and, until it is demonstrated to be otherwise, I cannot think trout see in any different manner, or by any different means, than do we. There may be a difference in degree, but I cannot believe in kind.

It is to be hoped that not only will "Brooklynite" continue his experiments, but that others will enter the field as well. Such cannot but be productive of good. Let us relegate the era of guessing to a past age, where it properly belongs, and before the coming season is over know something definite in reference to this matter so important to our interests.

NEW YORK. HENRY P. WELLS.

THE DOWEL PIN IN FLY-RODS.

Editor Forest and Stream:

Mr. Wells's article on the dowel pin in fly-rods is certainly worthy of notice; and although it is not a new idea, it is by no means a poor one. There are a good many rods made now without the dowel (or tenon) and from my own observations, they are every year gaining in favor.

I will not take room in your paper to write at length on the subject, but will ask for enough space to give in a few plain words my approval of this method of making fly-rods.

For a long time I have been trying to convince my customers that the way to construct a light fly-rod to obtain the greatest amount of strength and uniform elasticity was with short ferrules and without dowels.

When a rod is ordered from me I always suggest the idea of making it without dowels; sometimes this is looked upon as being a good thing and the rod is so ordered, but others look at it as something new, and they don't wish to try anything different from what they have always used.

I would as soon make a rod with dowels as without, and always try and satisfy any notion a fisherman may have regarding his rods, but for the last seven years I have made all rods for my own use without the dowel joint, and have found a more even spring and fewer fractures the result.

By parties for whom I have made rods in this manner I have heard them very highly spoken of, and have had many of their doweled rods brought to me for repairs, and at the same time been instructed to remove the tenons, which I do, then plug the socket with hard wood firmly glued and shorten the ferrule. A long ferrule reduces the spring of a light rod to a much greater extent than most fishermen imagine, and unless the female ferrule is long a dowel is of no use.

I have had rods brought to my shop for repairs that had the socket for the dowel bored below the female ferrule, which, of course, completely destroyed the strength of the rod.

Then again, as Mr. Wells says, to repair a rod that has been broken at or near a ferrule, it shortens and stiffens the rod to a degree that is very damaging, and in making repairs of this kind the rod often has to be worked down from butt to tip before it is a fit article for a fly-fisherman's hand.

As to the strength of a rod, if we take, for instance, a fly-rod of 6 ounces, or 7 ounces, and make it with dowels, the wood of the tip below the ferrule is worked down to receive the tapering piece of metal until it is about the size of a knitting needle and tapered to almost a sharp point. Now there is not strength enough in this piece of wood to in any way assist in preventing a breakage should the rod spring at the ferrule.

Most rod makers are now making the tenon solid with the male ferrule, and although this is stronger it is heavier, and does not prevent the necessity of a long female ferrule, which, in a measure, takes the long even bend from the wood, and having a greater amount of purchase than a short ferrule is much more liable to cause a fracture than to prevent it.

I have made a good many bass rods, after the Dr. Henshall and other patterns, and with one exception they have been made without dowels, and I have never known of a ferrule having been bent on a rod broken at the ferrule, although some of them have had very rough usage among the Thousand Islands and Lake Champlain.

I think Messrs. Abbey & Imbrie, of New York, make the Henshall rod in this manner, and Mr. C. F. Orvis makes his rods without dowels.

There is another point in rod-making which should be considered, and which I have practiced for a long time, viz.: the fitting of ferrules without cutting away the wood the thickness of the metal. The ferrule should go "over" the joint of a wood rod, the same as on the split bamboo. The enamel of the bamboo is never cut to fit the ferrule on (I speak of fine rods only), and it is almost as damaging to a wood rod to cut it around to fit a ferrule as it is a bamboo.

If we take a piece of hard wood, lancewood, for instance, ¼ inch in diameter at the middle and tapering to ¼ inch at either end, make a slight incision around the center of the rod, then fasten one end in a vise and spring the rod until it breaks, and nine times out of ten it will break at the incision, although it may not be more than a scratch around the wood.

I taper the joints of my rods to the inside diameter of the ferrule, and let the ferrule go over the whole diameter of the joint, then with a neat wrapping of fine silk, or a ring which can be put at the female ferrule of the butt and second joint; it makes when varnished over fully as nice a finish as to cut the wood away.

But I will not go into any more details, as I am afraid I have already taken too much room in your paper.

GEO. F. ALDEN.

FISHING IN CARDENAS BAY.

BEING in Cardenas, and finding that a gentleman whom I wished to see would not be at home for several days, I thought I would make time pass quickly by taking a fishing excursion, so I went down to the wharf where the fishing smacks, or *viveros* come in and asked the captain of one of them what he would charge to take me with him on his trip. He said he would not charge me anything, but that I could bring something along to eat and that would be all that was necessary. We went to the Plaza, and for $13 paper I bought a large basketful of vegetables, eggs, oranges and four or five pounds of fresh meat, for the kind of fresh fish the fishermen like best is *carne de vaca* (beef). I did not forget some cigars and cigarettes.

At 10 P. M. we set sail to catch the first of the land breeze, that commences to blow generally at that hour, in company with about eight or ten more *viveros*, so called from the fact that they have a tank on board where they keep the fish they catch, alive, there being many holes in the bottom of the same so that the sea water circulates continually through. We went down the bay, which is about twenty miles long, outside of the lighthouse on Rock Key, to the open sea, and after fishing all day we would run in behind some key or small island and anchor for the night. In the morning we would run out again, and so continue until the tank was filled. In our case this took four days. I have been on fishing excursions many times, as you well know, but I never saw so many fish caught in so short a time before. The lines we used were large and strong, with hooks about the size of bed spring wire. Still, many times the fish would get away with the tackle, so you can form some idea of their size. We used live fish about six to ten inches long for bait, hooking them through the back, and seldom would I throw out my line with a good, lively bait on the hook, without seeing it snapped up by a ten or twenty-pounder, and then would come a tussle. I tell you, they fight hard, and it takes some tact to bring to the top of the water so as to get a net under him, a big fellow, three or four feet long, with teeth like a saw. In fact there is a kind of fish they call *sierra* (saw). I found out one must keep a cool head and not get excited if he wishes to be successful at this sport.

Many times, after a long struggle, I would get my fish to the side of the boat, and then, before we could get a landing net under him, away he would go and I would have to go through the same maneuvers again before getting him safe in the tank. My hands are sore and cut by the line running through them, and from handling big fish. I won't say how many fish I caught, but I will say that I fished until I was tired out with the sport.

One thing which contributes greatly to the sport is, that the water is so clear that one can see down to a great depth, and so can always see his fish when in the act of taking the bait, which is done like a flash, and away goes the line and the fight begins in earnest. One must have blood like water if it does not surge through his veins as a big fish drags the hissing line through the water, now here, now there; perhaps toward you, giving you lots to do to pull in the slack to keep him in hand; then, again, off like a flash down deep in the water, until you begin to think he will never stop, but take all your line, and that you will have to let him go, but just before you reach the end you feel the fish getting weaker. You hold on a little, restraining him, and little by little begin to pull in. Perhaps you will get him to the top of the water, but it is much more likely that you will see him dart off again to renew the fight, and sometimes with a grand leap clear from the water, he will let you see what a magnificent prize you have hooked. Then after all is over, and he is swimming in the tank, you would say, as I did, that you never knew what it was to fish until you had played a big thirty-pounder, and after a half hour's fight brought him safe to hand.

There are a lot of sharks after the boat, great, wicked-looking objects, who would make short work of one in no time. We would often throw over dead fish, which they would snap up in a flash, fighting among themselves for the prize, and then I would give it to them with my revolver. There was one which I wounded three times in the head, and still he would keep on after the boat and look up with his wicked eyes, as much as to say, "Oh! I am here yet."

If I go again I intend to take a shark hook along for them. They would often take our bait, but of course we could do nothing but let them break our lines. The *vivero* on which I went was about the size of the clam sloops which come up the Hudson. The captain was a young Cuban only three months married, and as nice and kind a person as one would wish to see. He could not do too much to make my trip pleasant, bringing dishes and other conveniences from his house on purpose for me. I did not have a good appetite for some time before I went on this trip, and it has done me much good. I see I have made quite a long letter of this, and as I want to say a word or two on other subjects I will stop.

C. H. GALLUP.

THE LENGTH OF FLY-RODS.

Editor Forest and Stream:

In your issue of Feb. 14, Mr. R. H. Dixon had a brief article upon "Fly-Rods, Long vs. Short." I was glad to see it, because the superior success attending the use of long rods has been mentioned to me more than once. I confess that I am totally unable to see why a long rod should have any advantage over a short one, provided the user of the short one can make long casts, and I do see many reasons why a short rod is always a more convenient and manageable thing than a long one. Then, too, the constant tendency to shorten rods, for all uses except fly-fishing, which has been very manifest for some years past, and the repeated declaration of those who have used both kinds that the short rods are better, would seem to be decisive against the long rods. I can easily see that, if the angler can only cast a line twice as long as rod, he who uses the longest rod will have the most success, for it is a general rule that the longer the cast the greater the likelihood of taking fish; but the users of short rods are generally expert casters and in no way limited by the length of their rods. Still, let us have the experience of the users of both kinds of rods; let us have the matter discussed; good will come of it. Mr. Henry P. Wells, in his recent most excellent article, said: "The anglers have fallen, or are falling, into a rut, and are three-quarters asleep besides." Let us wake up; let us get out of our rut. The way to do this is to discuss and compare our various practices.

I have, in a brief way, championed the short rod, but I am willing, nay, anxious to learn the intent and value of a long one, or of any other appliance or practice in use by my brethren of the angle. I want to be taught anything that will enhance my enjoyment of my favorite recreation.

In conclusion, let me call attention to the last paragraph of Mr. Wells's letter, so that anglers may be roused to the use of the pen: "A comparison of the correspondence in your paper in reference to the art and implements of the angler with that in reference to other sports, is a standing shame and reproach to every man who handles a rod."

M.

STURGEON FISHING.

Editor Forest and Stream:

Mr. Clayton Von Culin desires me to explain. Permit me to do so.

In my story entitled "Gaffing a Sturgeon," which appeared in a recent number of FOREST AND STREAM, I had no intention of descanting on the size of the fish taken, knowing well that sturgeons reach enormous size and weight.

As to the *modus operandi*, let me say that sturgeon lines proper, range from 100 to 1,000 yards in length. These are anchored securely at both ends, and buoyed at certain distances from the shore. This fish line proper, has suspended from it at regular distances of three feet or so, smaller lines of about two feet in length, each of which is hooked and baited with perch cut up in small pieces. The position of the line proper is thus suspended from buoy to buoy, and so the hooks will be, some off the bottom at different distances, and those in the middle will lie on the bottom.

The fisherman stands in the bow of his boat, because the stern of it would fill if presented to a heavy sea. A commencement is made at the leemost buoy, and the line proper is passed along hand over hand—hooks whose baits are destroyed are rebaited, those having taken fish are removed from the line proper by jerking the slip knot that fastens the small line to the line proper as soon as the captive fish is safely gaffed. A fresh small line and baited hook then replaces the one just removed, and so on till the whole line proper has been overhauled. The boat then returns to shore, the fish are cared for by being cut up, smoked, etc., and the hooks then taken out of their mouths.

Pound nets are also used, but not in the places where the aforesaid lines are the only means of sturgeon taking.

The condition of the water as to roughness makes all the difference to the labor of gaffing, not only because it is more difficult to stand and work in the boat, but because there is nearly always a greater catch by reason of the fish both biting better and the time being longer since the lines were last gone to after a blow.

PORT ROWAN, Ont.

THE FISH QUESTION IN MAINE.

THE Norway, Me., *Advertiser* prints the following from an Oxford correspondent who signs himself "Mark Tapley:"

There are many rumors afloat in regard to the little disturbances of last week caused by the visit of one of the State Commissioner's emissaries to our villages. The truth as near as we can ascertain, seems to be that Leander Wardwell pleaded guilty to a charge of catching one spotted trout, for which crime he made satisfactory amends. The other-fish, a kind of mongrel, known as togue or Thomson Pond trout, don't come under any of the statutes. Mr. Wardwell is one of our most respectable and worthy citizens, and we have no idea he was conscious of violating any law at the time. Neither had the *Advertiser's* correspondent any evil intention in making the thing public. The law as it exists, is strongly disapproved by almost the entire community. Still as it is the law let us obey. We hope our next Legislature will be asked to modify this law so as to give our own people the privilege of catching a few fish now and then, and not give to a set of city grandees all the preference, who hang around our hotels at a time when the working people are so busy they can't attend to it.

The "togue" is the fish known in New York and elsewhere as lake trout, and is not a "mongrel," nor a fish peculiar to any pond. Commenting on this one of our correspondents writes:

Editor Forest and Stream:

I inclose you a little slip, cut from Norway *Advertiser*. See how they go for our hotel guests. I am trying to learn who wrote that article, but am unable. I was in hopes to see some of our Commissioners come out on this last week in answer to that article from Oxford about the trout, by which I learn there is more truth than poetry in the charges. Nevertheless this poaching ought to be stopped at once. It is a shame to destroy the fish as they do. They say they don't catch the speckled trout, only togue, or lake trout. The law is the same in both cases, if I understand it correctly.

I talked with Wardwell the other day. He will give

them a hot pill if he can only get a chance. In regard to that part where "Mark Tapley" speaks of giving a privilege to our own people of catching, etc., and his slurs on the guests of our hotels (for I happen to be in the hotel line), it is an insult, and no person who has common sense would write such trash.

It is a shame that the State would not give those poor, overworked people a certificate, allowing them to fish the whole year through with nets, snares, spears, etc. Our country stores would not be so crowded, perhaps; they do more work there than anywhere else, when, in fact, they go fishing at their pleasure, regardless of the law. But when one gets taken up and punished, why then they complain and go for the gentleman sport or true fisherman, who comes only when the law says he can, fishes in a sportsmanlike manner, and winds up his tackle and goes home the moment it goes on again; comes here at large expense, paying for board at the best hotel; gets the best guides, the best boats and, the best of all, never finds a word of fault with his bills; has had a good time, grown fat, and returns home a wiser man, with hopes to come again another year.

MAJOR LOVEJOY.

BETHEL, Me., Feb. 20.

A SNAPPING TIME.—Philadelphia, March 5.—When I was a boy of about fourteen I was accustomed to spend my summer vacation in the country with a farmer friend, where I devoted my time to the pursuit of pleasure in general. Principal among my enjoyments were the rod and line which I plied with varying success in the "raging canawl," which "raged" but a few fields distant from the house. One bright morning in August, after a refreshing rain during the night, I hied me to my favorite nook, just across the lock, in a corner of the dam formed by the overflow of the canal. It was a famous place for catfish, and I soon had a fine string. While waiting for another bite I soon saw my cork disappear slowly but surely, and something told me I had a big one, which I proceeded to land. To my astonishment, though the rod bent and cracked, I found I could not move my fish, and then reluctantly concluded that my hook was fast on a log or brush; so I pulled and switched to right and left all to no purpose, and was on the point of breaking the line when I felt it begin to yield. Slowly, very slowly I pulled my fish to shore and then, fearing it might break away, I seized the line with my left hand and drawing my fish close to shore, slid my right hand carefully down the line to get a good hold near the fish. I had scarcely got my hand under water when—great Cæsar! Christopher Columbus! Had lightning struck me, or a house fallen on me? Pain, as though pierced with ten million needles, shot through my arm, and, jerking my hand from the water, I brought with it, attached to my index finger, with his jaws set through the root of the nail, his eyes closed, his head drawn into his shell but hanging on with the tenacity of a bulldog, a snapping turtle about a foot long, but weighing fully a ton. The pain I suffered was simply agony, and I thought I felt all the tortures of Fox's martyrs boiled down. Perhaps, if there had been any one to hear me I would have yelled, but no one being near I "suffered in silence alone." However, I severed the line (how, I don't know) and supporting the weight of my captive (?) with my left hand, dashed across the lockgates (before I had crossed Oh, how carefully) up the hill, over the fences (I don't know how) and into the yard of good farmer H. As luck would have it he had just come in from the field and his shout of laughter as I danced around and implored him to help me let go the snapper, brought all the girls from the kitchen, and for a while the chances of release seemed slim. However, sympathy prevailed and, after much punching and prodding with a piece of hickory, his snappership's jaws were pried open and my finger released, and from that day I abandoned the rod and took up the gun as the less dangerous of the two. Moral—Take a bull by the horns, but never take a snapper by the jaws.—JUVENIS.

A PECULIAR FISH.—Concord, N. H., March 5. An exceedingly interesting question has arisen in Dublin, N. H., in relation to the subject of fish protection. It appears that of late persons have been catching a certain kind of trout from Dublin Pond and claiming that it is a peculiar species and is not protected by the State law. The local wardens refrained from making arrests under the circumstances, but caught some of the fish and forwarded them to the State Commissioners, who are Col. George W. Riddle of Manchester, Hon. Luther Hayes of Milton, and Col. E. B. Hodge of Plymouth. These gentlemen sent the specimens to Harvard University for examination, and an answer has been received from Prof. F. W. Putnam, Curator of the Peabody Museum. Prof. Putnam, assisted by Prof. Gannon, head of the Zoological Museum, has made a preliminary inspection of the fish and says the variety is one they do not yet make out. At present they are inclined to believe them a variety of the *Salmo fontinalis*, or brook trout, but add that a further study may change their views. In the meantime the Commissioners have instructed the Dublin Wardens to prohibit the catching of the fish under discussion, and to prosecute all persons found taking them. This action is based on the belief that they are a variety of brook trout. They are small in size and fine eating, and their general appearance is such, that if a few of them were mixed with accepted brook trout it would require an effort to separate them. There is a rumor that Agassiz once stated that he discovered a rare variety of trout in Dublin Pond, such as was found nowhere else in the United States, excepting in a small lake among the Rocky Mountains.—*Boston Journal.* [We have seen the singular trout from Dublin Pond, and think it merely a white form of the common brook trout. These silver fish, which are the rule there, occasionally occur in Caledonia Creek, N. Y.]

FINGERLING TROUT.—New York, Feb. 28.—*Editor Forest and Stream:* I am glad to notice that now and then some indignant angler "stirs up" the trout hogs who slaughter fingerlings and call it trout fishing, when they ought to be imprisoned for infanticide. And I see that the Connecticut Fish Commissioners have been endeavoring to get a law passed limiting the size of trout, "exposed for sale," to six inches. Can't our Legislature give us a law fining any one in possession of a dead trout under six inches? If we don't do something to stop this slaughter of trout babies, we'll soon have to mourn the loss of the whole species.—MANHATTAN.

"SEBAGO," OR "LAND-LOCKED" SALMON.—Cannot we get a better name than that of "land-locked salmon," for that choice fish? Why not come back to *Salmo sebago?* for the last report of the Maine Fishery Commissioners seems to show that they are again becoming plentiful in that beautiful sheet of water, and that specimens of great size are being found there. Food and water seems to determine the size of the fish, for it is a fact that those which were hatched from eggs from Grand Lake stream and planted in Sunapee Lake, in New Hampshire, have been taken last summer of over 6 pounds in weight, in several instances.—VON W.

WHAT FISH IS THIS?—Cayuga Lake, N. Y., March 1.—I wish that some of your readers would tell me what kind of a fish it is that has come into Cayuga Lake within the past two years. When small they look like trout, but when grown they can hardly be told from bullheads. My attention was called to them by John Parker, the fisherman who showed me some of the little ones a year ago. Last fall he caught full-grown ones with bullheads. It is thought that it is some fish that has been planted here by some one who has been fooled with a worthless fish.—W.

SALMON ANGLING.—*Editor Forest and Stream:* Should any of your readers be in search of a real first-class salmon river, they can have their desire satisfied. I happen to know that the Moisic, on the north shore of the river St. Lawrence is just now vacant. It can accommodate four rods and the fish run very large, looming up in the forties. Weekly steamer from Quebec and telegraph station. Early application to Mr. John Holliday, Quebec, will secure preference.—B.

Fishculture.

AGRICULTURAL DRAINING AND THE FLOOD.

IN the days of national calamity, caused by a repeated flood, it becomes the duty of every good citizen to assist in finding a remedy to prevent such disasters in the future.

Agreeing entirely with the foresters, who see the root of the evil in the destruction of our forests, I go further yet and charge it in addition to the neglect of water farming. It is astonishing what an amount of labor and capital there is unconsciously expended in this country to decrease the value of our creeks and rivers by a condemnable rude method to rid farming lands of water, not to mention other surfaces.

As soon as any way possible, the farmer drains all his land; many a dollar is spent in tile, culverts and other devices to secure a rapid and direct off-flow of the water. This is well enough if done with proper care. It is necessary to produce crops in some soils, but it can be and is overdone.

It is quite plain that after heavy rains the already full-running creeks will be overtaxed by additions of water from innumerable drains, and in consequence they will be forced to overflow and wash. What is to be done then is to retain that part of the water which is under our control as long as possible, to the great relief of the creek. This can be done by constructing ponds.

Prof. N. H. Eggleston shows how the leaf mould sucks up and retains the water for a long time, thus preventing both a sudden freshet and a sudden drought. These same faculties I claim for ponds. The remarks made by farmers that it does not pay them to replant part of their land with forest may be correct, as I hardly think that small tracts of forest could withstand the effects of dry winds in the summer to such an extent that a sufficiently thick coat of mould would ever collect to act as a sponge. Forests, therefore, to be of any service in that direction, would have to be planted in large tracts and kept up by companies or the State.

Ponds, like leaf mould collected in a forest, retain vast amounts of water; the drains of cultivated land can be led into them, and from there, after fish have had the benefits of the ingredients washed from the fields, it would gradually pass into the little run or rivulet. The latter would then be assisted during a "run," the water flow during summer better regulated, and the much-missed fish of our creeks would make their appearance again.

Contrary to forests planted by individuals, ponds pay almost from the beginning. Tracts of land which have to be drained with much expense to be suited for agriculture, can sometimes, with a trifling expense, be turned into good ponds, and made to pay far better than the best field. The desired "sponges" would thus be re-created by individuals to assist those formed by large forests under State control. The water before looked upon as waste and driven from the premises to bring devastation, would thus be made a servant; which fact is very important, since the old proverb truly says that "the water is a good servant, but a bad master."

HUGO MULERTT.

CINCINNATI, O.

DEATH OF MR. JOHN E. REARDON.—We are informed of the death of Mr. John E. Reardon, president of the Fish Commission of Arkansas, on Dec. 4, 1883. Mr. Reardon was a well-known citizen of Little Rock, and had been a Commissioner for a number of years. He was a warm friend of fishculture and had long urged his State to take a more active interest in it. He was highly respected by a large circle of friends in both public and private life.

THE WYOMING COMMISSION.

THE biennial report of the Fish Commissioners of Wyoming Territory, for the two years ending Dec. 31, 1883, is at hand. It opens with the fish laws of the Territory.

The year 1882 was devoted almost entirely to the planting of native trout and other varieties. The practical results attained from all of the plants are very successful.

Brook trout planted by the Commission have been taken from the "alkaline" (?) streams of Laramie and Albany counties, which never before afforded them. *Salmo fontinalis* weighing as much as fourteen ounces have been sent this season to the chairman of the Board, almost reaching the status of a three-year-old—which is sixteen ounces—placed under the most favorable conditions—a sufficient proof that streams flowing into the North Platte will support trout.

Concerning this planting of trout in alkaline waters the Commissioners say: "In the beginning of our work we were often informed that it would be waste of money and loss of time to place trout in an alkaline water, whose proverbially known constituents would destroy the plant. Disbelieving, however, this "well-known fact," we have gone on, meeting with flattering success. Trout will live in such waters as are found heading in the Black Hills and Rocky Mountain base. We believe they never were there, until the Commission placed them in the streams."

Carp have thriven wherever planted and promise to give good results. Directions for making ponds are given.

NEW PUBLICATIONS.

The Angler's Note Book and Naturalist's Record is again to be resumed by the editors of the "Bibliotheca Piscatoria," W. Satchell & Co., 19 Tavistock street, Strand, London, W. C. The Note Book is specially designed to promote the interests of writers, publishers and sellers of books on angling and other field sports. Bibliography will also receive a large share of attention. The "Green Series," published some three years ago, was exceedingly interesting, and many regretted its suspension. The present series will cover twelve monthly numbers.

MILLIONS OF DOLLARS WERE LOST by men who were accidentally injured in 1883, and not insured in the Travelers, of Hartford, Conn. The wise ones insured and drew $864,000 in cash benefits.—*Adv.*

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1010.** Volume I., bound in cloth, sent postpaid, $1.50.

EXPERIENCE WITH DOGS.

Editor Forest and Stream:

My experience with dogs covers a period of twenty-five years.

I believe I am as free from prejudices regarding breeds as it is possible to be. My first dog was an imported English setter, thoroughly broken, and a finer dog is seldom seen. I have since owned red Irish and Gordon setters, pointers, and Llewellins, and I candidly believe the difference between them is far more imaginary than real. Individual pointers and setters differ more widely than do the two classes. The performance of a single setter or pointer proves nothing but the merits of the individuals immediately concerned. I have worked pointers and setters side by side, day after day, and season after season, and I would not give five dollars either way as a preference.

I have never owned a pointer that would refuse to go where a setter would. With the exception of the first dog mentioned, I have broken all the dogs I owned myself, and I contend that a dog properly trained—pointer or setter—will remain so, as long as worked by his trainer or any one who understands the method by which he was trained, and that he will begin the season as steady as he closed the preceding one. Herbert set the fashion in dogs in America forty years ago, and the "Forester bathos" continues to-day, so far as dogs are concerned.

His opinion of pointers arose from a very limited knowledge of them. This is plainly shown in his works. Charging pointers with lack of affection, and hunting with a stranger as well and as readily as with their master, is not a characteristic of them by any means. I have never owned a setter or pointer that would follow a gun or hunt with any one but myself. "Hunt," in an article on the subject, states that pointers are inferior to setters in speed and endurance. This is the first charge of the kind I have seen. The setter when at work has an industrious air about him that is apt to deceive. The pointer ranges more widely and goes with a bound that does not show up as well as the other, but he will cover as much ground and pass as few birds as the setter. I have a pointer nine and a half years old that worked last season on chickens day after day in company with a son of Gladstone and an Irish gyp. They were both good ones and much younger, but the noble old fellow more than held his own. If one inclines to setters he should own them, if to pointers they are his dogs. If he has more than one let him get one of each. After using them for a number of years he will be of my way of thinking. A dog is just what you make him. Give him proper care and affection and he will come nearer anticipating your wants than a human being can. DICK.

BRAZIL, Ind.

FOX HUNTING ON OIL CREEK.

SOME six weeks ago Doc P., of Petroleum Centre, presented the Rhodes Brothers, of Pioneer, with four of his famous foxhounds—Drive, Tickler, Center and Jo B. Thursday of last week, being the first fair day for hunting, the boys crossed Oil Creek, and at the mouth of Bull Run they jumped a big red fox, whose confidence in himself was signified by the pauses he made in listening to the bay of the dogs as they made the first rush to get in. It was but a few minutes, until he understood that there was a different class of hounds in his wake from what he had been in the habit of dealing with, and with a good-bye switch of his tail he began his flight for Becker's Heights, where for about thirty minutes they poured it to him so hot and fast that he made a break for Cherry Run, up and down the banks of which they drove it to him so fast and furious that he began to get frightened, thereby losing his confidence. Crossing at Morrison's Corners the music of the dogs was glorious, double discounting any "Dutch band" in the State.

The pace was now at its best, Drive and Tickler running to catch, while Jo B., Center and Wynder, one of their best home dogs, were well up. They were now making the pace still more terrific, and reynard was fast losing his head. He tried several short turns, but the scent was good, and the dogs were running with their heads up. His twists and short turns amounted to nothing. They were now giving it to him hot and heavy, part of the time in sight. He swept in toward McDonald's Rocks, but they pushed him so hard that he took the big road back toward Oil Creek. Hokey, pokey, you ought to have heard them giving it to him now; how they cried for help, but the pace was too much for him. They were fast overhauling him, when he made a short turn into the meadow and tried to reach some thickets on Hutchinson's Ridge, but Drive overhauled him nearly in the door-yard of the Burns Mansion, his jaws just closing on him as Tickler got there, followed closely by Jo B., Center and Wynder. Time of run, one hour and twenty minutes—well done on strange ground and with strangers. But that is nothing when you have the stock. Delighted we were with the hunt and our new dogs, but our glee was great yesterday and our cup bubbled right over the brim with fox-hunting fun. Harley feeding his dogs at noon, letting them out of their kennel at the time, ten minutes after which they winded a big red fox as he was crossing Western Run. In a jiffey they were giving it to him up on Benninghoof's Point, back across the run, up by the white school house, over the Stillwagon settlement.

The music now was soul-stirring, I know reynard was enjoying it, for he made a bee line for the city of Titusville, so the hunters there could hear it too. The pace was now killing, the cry of the hounds was fast and furious, it was the anxious whining cry of dogs that were running to catch their game. At Boughton, just below Titusville, the pace was too great for reynard, he had to make a turn, taking the creek hills back; he tried every way to shake himself clear, but Drive and Tickler would not be denied while Jo B., Wynder, and Center were bound to be there at the finish. The pace was a hot one as they worked their way down the creek, the music was delicious, knocking out all the Jenny Linds that ever crossed

the sea. At Gregg's Switch they made it so warm for him that he tried to get over the sedge. It was while climbing the summit that we got the first glimpse of his impudence, tongue out, brush down, ears laid back, running zig-zag, aimless, head gone, picked up by Drive as he was crossing a clear patch, with Tickler so close that it was almost a doubt which nipped him first; Wynder, Jo B. and Center close up and getting in at the wooling match as they shook him up. Time, two hours and fifteen minutes. This is a team that you will hear from again. HOUP-IT-TO-EM.

PIONEER, Pa.

THE DACHSHUND.

Editor Forest and Stream:

In the last issue of your paper I saw an article about the dachshund and his pointing like a pointer or setter to a bird. I have never seen this done by any of them. I think it must be very uncommon. I always found that as soon as they get the scent of game they pitch in for it without stopping.

I have had a good deal of experience with these smart and spirited little dogs in Germany, where they are very common hunting dogs. Indeed, every forester and almost every sportsman keeps one or two of them. Mostly they are used to drive foxes and badgers out of their holes in the ground, while the hunter waits behind some bush or tree to lay them low as soon as they leave the dog in possession of their homes. Sometimes a fox, especially when sick, will not leave, even when attacked by a sharp dog. In one instance, I remember, the dog of a forester, a friend of mine, had got away from the chain and hunted on his own responsibility. When the dog did not return the third day after he left, his master inspected all the fox holes in the neighborhood, and in one of them he heard his dog bark and sometimes make attacks on his enemy. It was evident that the fox did not want to jump, so his warm home was laid open with shovel and pickaxe. We could not see the fox through the opening we made, but the dog came out panting and covered all over with sand. His master caressed him and offered him a nicer-piece of meat out of his pocket than he had ever tasted in his life. But the dog did not even touch it, but turned and went down again to finish his fight first. When the fox was finally killed, we found that he was sick, and that was the reason he had not jumped. As soon as this was done the dog lost all his pluck, and showed so much exhaustion that his master carried him home. He did not refuse then the meat any more.

Once I saw two puppies, which were about eight months old and out for the first time, attack an old fox which had been shot but not killed. Even after receiving several bites from the infuriated animal that made them howl they did not keep off, but killed him, and had such a hold of him that the gentleman with whom I hunted lifted fox and dogs up and swung them over his head, but they did not let go.

I have seen old dogs of this kind with torn ears and scars all over their body. They get these mostly in fights with the badger. This animal is a worse foe even against the strongest dog than a fox; these jump a great deal easier than the badger, which is generally too fat to feel like leaving his home in a hurry, but fights harder for it.

We shot a great number of foxes with one of these dogs. He went into the thicket and was sure to drive the fox into shooting distance, and he finished him in good shape when not killed by the shot. It is astonishing to see how these little bow-legged animals will run, and what an amount of perseverance they possess. They have a splendid nose, and tied to a line make excellent retrievers for wounded deer. They are used a good deal for this when there are no bloodhounds.

I always liked these bright little fellows with their beautiful heads. I remember with pleasure the days when I heard their high voices in the German woods, expecting the appearance of Mr. Fox every minute.

There is only one drawback to them. It is very hard to make them mind. If excited by the chase, you can yell at them ever so much, they will go on like fury. X. Y. Z.

OSHKOSH, Wis., March 1.

MANGE AND CANKER.

Editor Forest and Stream:

The desire of imparting to the world any useful knowledge that one may have acquired is a most laudable one, and I have no doubt but what that was the motive which prompted the communication in your last issue, from Mr. Thomas But. But it is rather aggravating, for any one who thinks he knows something about the subject, and has had some experience in the matter, to see in print that a certain combination of ingredients will cure the worst case of mange with two applications, and, another one, canker of the ear with three. Being a medical practitioner, and also a lover and owner of dogs, I have naturally paid some attention to canine pathology and therapeutics, and, although I have come to the conclusion that with the exception of cathartics, tonics, etc., the less dosing a dog gets the better, from the fact of my practice being in a great measure in the special branch of dermatology, I have taken a good deal of interest, and spent considerable time in investigating the lesions of the skin on the dog. The term mange, as used, is a most indefinite one, being popularly applied to almost any cutaneous affection that has itching as a concomitant. In many cases washing and any cooling or soothing application is all that is needed, and not a few will disappear without any treatment at all. The severe contagious power of mange is due to a parasite, which is the same that causes certain skin diseases on the human race, *i.e.*, ring worm, scald head and barber's itch, according to the seat of its development. This parasite is a fungus, known as trichophyton, which, once planted in the skin, multiplies by rapid production of microscopic sporules not very different from those of the yeast fungus. On the skin, *i. e.* ring worm, it is easily killed by any strong application, on the scalp and in the beard it is a much more difficult matter, as it attacks the hairs, and develops in the hair follicles, where external applications cannot reach it. This is the case when a dog is affected with it. The prescription Mr. But gives is composed of very excellent ingredients, but they are no more so than many other well known anti-parasitic applications, such as carbolic, phœnic or salicylic acids, and to say that that especial combination will cure every case of mange with two applications, is simply absurd.

In the same way the term canker of the ear is applied to all cases where there is an irritation of the external auditory canal sufficient to produce a discharge, and to cause the dog to shake his head and scratch his ear with his hind paw. This may be caused by many things, such as the presence of a foreign body, an accumulation of wax, a little eczema (salt rheum) of the inner ear, or inflammation of the same, which may merely affect the superficial mucous membrane, or may extend deeper so as to cause disease of the bone, destruction of the drum of the ear, etc. Practically, such cases, even the commencing ones, are very hard to handle. The only case that I have ever known of, where the disease had really existed for some time, that was cured, was in the case of a dog belonging to a friend of mine, in whom a mutual friend, a scientific aurist, took interest enough to make frequent applications and cured him. The canal of a dog's ear is quite deep and crooked, and I doubt if any body but a specialist could succeed in making applications to the deeper parts. It is only fair to say that in this case, I believe it was boracic acid that was used, but so far from three applications curing it, I doubt if, had the dog been a patient, a hundred dollar bill would have settled his account. I have no wish to criticise Mr. But's communication, as I have no doubt but that he has had excellent results with the two prescriptions he has published, but he claims too much for them, of which fact time will convince him. We have now several men in the country who have taken hold of veterinary medicine and surgery with a thorough and scientific education, and it is to be hoped that their influence will be able to lift horse and dog doctoring above the use of empiric mixtures.

However, when I remember how often, when on my annual trips for rest and sport, I have, when some native found out that I had a Dr. before, or an M.D. after my name, been asked, "What will cure a headache?" or, "What is good for a cough?" I ought not to be surprised to see that a certain mixture would cure mange, or canker of the ear. MIC. MAC.

BOSTON, Mass., March 8, 1884.

CINCINNATI DOG SHOW.

THE bench show held this week at Cincinnati, O., has proved an immense success. There were in all 289 entries, exclusive of the specials. The attendance was very good, in fact, the hall could not at any time conveniently accommodate the crowds which literally packed every corner.

The sporting classes, especially the Irish setters and pointers, were well represented; also the non-sporting, in pug, Yorkshire terrier, and toy terrier classes. Mastiff, St. Bernard, and Newfoundland classes did not fill so well, but the greyhounds were a fine collection.

Major J. M. Taylor judged the setters and pointers. Mr. J. Mortimer all other classes.

MASTIFFS.

There were three entries in the mastiff class. Lion, a fine dog, with good legs, back and loin, won easily. Leo, who won second, is a fine dog, with a good mask, but his ring tail is against him. Gulnare, who was given an hc., is only five months old. She may develop into a good one.

ST. BERNARDS.

The St. Bernards were a poor class. Rex, who won first, is a fair puppy. Finette, who won second, is too small. The others were a poor lot.

NEWFOUNDLANDS.

The first prize was rightly withheld for want of merit. Nig, who was given second, got full as much as he deserved; he is a large well shaped dog, but is too curly in coat.

GREYHOUNDS.

The greyhounds were much above the average. Parvin's Major, who won first, is a very fine animal with lots of quality, he will compare favorably with any that we have seen. Smith's Major, who won second, was shown in bad form; he has a racing-like look that is very taking; he has excellent shoulders, legs and feet. Pedro, who won vhc., is short in neck and heavy in shoulders. Gypsy, hc., is well formed, but was shown too fat; had she been in condition she would have beaten Pedro.

SCOTCH DEERHOUNDS.

The first prize winner, Ray, is a very fine animal; he has good head, ears and coat, he is a trifle weak in loin and quarters, which is probably owing in part to lack of proper work. Dick, who won second, is also a fine specimen, of good form, but a little undersized. Queen, who won vhc., is a fair animal with a capital coat.

SETTERS.

In the champion English setter class, Lava Rock, the only entry, was absent. In the champion bitch class, Dido II., owned by Gen. W. B. Shattuc, had a walk over, there being no other entries. She has wonderfully improved since we saw her at New York in 1883, having let down and lost the tucked up appearance which then characterized her. She is an extremely handsome bitch and fairly earned her honors.

In the open dog class, Dick Bee, a smart little dog, was first, and deservedly. Count Gladsome, with wonderfully good chest, legs and feet, came next, his weak point being his badly placed ears. Royal Lothair, vhc., is a very powerful dog, rather coarse in head, and with loaded shoulders. Maxwell, vhc., is rather a commonplace dog, he looks like a good mover. Rocket, hc., ought have changed places with Royal Sultan, c., who was all out of condition, being quite sick. In bitches, Nellie B. won first over Flora Bee, second. Joan of Arc, a very handsome bitch, but with a bad stern, was vhc. Lucy D., hc., and Faustina Lava Rock, vhc., were all good ones. The puppies were a very fair class, Dan winning over Rex, a Count Gladsome puppy who inherits his father's badly carried ears but is otherwise a very promising puppy. In champion black-tan or Gordon setters Rupert II. had a walk over. Mr. Thayer's entry being absent. In the open class, for dogs or bitches, Mr. John E. Long's Hugo won an easy first, Mack, second, showing age. The others were scarcely worthy of special mention. There was but one entry in the puppy class.

In champion Irish setter dogs, Biz was conspicuous by his absence. In champion Irish bitches, Lady Clare had a walk over. She was shown in wonderful good coat, but a bit fat and soft.

In the open dog class, Norwood (Elcho—Rose), the property of Mr. Overman, of this city, won easily. He is a magnificent specimen, and will compare very favorably with the best. Barney, second, we did not so much fancy, and thought Brag, vhc., might have exchanged places with him. This was a good class and well filled. In bitches, Clara Bell won well; Effie, second prize, being also a very superior bitch, but showed cares of maternity. Clytie, vhc., Virginia Reel, hc., all local bitches, made up a very good class. In puppies, Lotta (Norwood—Nellie) was first, another Norwood puppy being second.

POINTRRS.

In champion pointer dogs, Bravo easily disposed of King Tom and Knickerbocker. In champion bitches, Marguerite II. won over the W.K.C.'s Lassie, Rhona being absent.

In the open class for dogs, over 55lbs., Mr. Munson's Meteor had an easy win. Joe, a dog without a pedigree, being second, he has a grand chest and loin, good legs and feet; but we cannot overlook his bull-terrier head, bad eye and illy carried ears and think Bang (commended only) should have been second. Lamplighter, vhc., was a useful looking dog. Donald II., vhc., is too stilty and straight at the shoulders. Icicle, hc., did not fulfil our expectations, we thought him well placed.

In dogs under 55lbs. Perry won the pride of place. The class was a very poor one.

In bitches, any weight, Vanity was a good first, Lady Croxteth second, Flash and Spinaway vhc. The latter is a very good bitch, in fact the quality of this class was second to none in the sporting division. Trinket, the property of Mr. Stoddard, vhc., and Moonstone, c., showed age. In puppies Rapp and Doncaster first and second, by Croxteth, are a very symmetrical pair. Glen and Dora, both vhc., give promise of future excellence. This class was also well filled, there being fourteen exhibited, and but few bad ones. This finished Major Taylor's duties, when Mr. Mortimer commenced with

SPANIELS.

In field spaniels, Hornell Rattler, a very useful dog with good legs and feet, but rather short in body, and in poor coat, was first, the heavy Clumber-headed Success being second. This is a grand-bodied and coated dog, but his heavy head and forelegs will always prevent him getting in the front rank. The others hardly deserve special mention. In cockers, Hornell Daisy, a good liver-colored bitch, won easily, Hornell Silk second. A workmanlike, merry little fellow, he is too high on his legs and too curly in coat. Black Bess, vhc., had nothing but her profuse feathering to recommend her, as she was out of condition, and her coat was faded. Hornell Dinah, a useful bitch, was badly shown. The other entries were of a nondescript character.

FOXHOUNDS.

In foxhounds, D. O'Shea's Ringwood was much the best of a poor class.

BEAGLES.

Beagles saw four entries, three of which came to the ring, Mr. John Brass's Rattler II. being absent. Rattler was first. Music II. second, and Major T. vhc. These are three good ones, Major T. being short of leather and light-colored eye, but good in body, legs and feet.

DACHSHUNDE.

There were only two dachshunde, both fairly good ones, the young one a trifle the best in bone and crook, also color.

FOX-TERRIERS.

Lyra had a walk over in the champion class. In open dogs, Lancelot won over Flippant, who was shown badly. He has a timid manner in the show ring. In bitches, the Surrey Kennel's Jill far out-classed the others, but a protest was lodged against her, a veterinary surgeon called in, and she was disqualified for mange. This also was the case with her in the puppy class in which she competed. Clover Belle, a seven months old puppy, by Akely Joe—Guilty, taking first. Mr. Thayer's entry being absent.

COLLIES.

In champion collies, dogs, Robin Adair had a walk over, he was in grand form, but is a trifle soft in coat. In champion bitches, Effie won. Open dogs introduced a very nice young dog, Mac, eleven months old, who deservedly was first. Cheviot II., a very strong, but rather heavy skulled black and tan being second. In the open bitch class, the prize was withheld.

BULLDOGS.

This class did not fill well. Mr. Thayer's entries in this class, as in all others, being absent. The winner, Mr. Livingstone's Boz, wrongly entered as Boy in the catalogue, is a very good one and won easily, as did Sweet Briar in bitches. The others were a poor lot.

TERRIERS.

Young Bill, the ever green, won an easy first in bull-terriers, Mr. Livingstone withdrawing his fine young dog Grand Duke, who had unfortunately broken out in blotches all over. Of the others, Chip, vhc., and Fanny, hc., were gamy-looking animals, but scarcely up to bench show form.

Black and tan terriers were poorly represented. Spring, first, is just an ordinary one.

There were no entries in Bedlingtons, and only one Skye terrier of very moderate pretensions.

In hard-haired Scotch terriers, Tam Glen was first. He is a typical little dog, but could do with a better head. Boxer was second, and Lady vhc.

In Irish terriers, Erin beat Norah, second, in texture of coat and color.

Yorkshire terriers were well represented, the local pets being far above the average.

PUGS.

In champion pugs, Joe, now the property of Mrs. Hill (Cincinnati) won easily. In the open class, which was a large and good one, Bo Peep, a nice little bitch with good mark and color, was first, Sambo second. Judy III., who is immensely fat and refused to show herself in the ring, had to put up with a vhc.

TOY TERRIERS

were a numerous and good class in which Lotta, a diminutive black and tan, weighing 1¼lbs., was adjudged the winner, Flora second. Charlie, a pretty white, black and tan toy spaniel, had a walk over.

MISCELLANEOUS.

The miscellaneous class as usual was a large collection of all sorts, from an immense Great Dane down to the tiny and elegant Italian greyhound, which latter breed was well represented. There were three prizes in this class, which went to a Caniche poodle, a Dandie Dinmont, a good, one and an Italian greyhound.

Following is a full list of the

AWARDS.

Class 1. Mastiffs.—1st, James H. Lynch's Lion, fawn, 2yrs. 3mos. Salisbury—Tigress II.; 2d, Geo. H. Ingall's Gulnare, fawn, 5mos.

Class 2. St. Bernards.—Harry D. Emerson's Rex, orange and tawny, 6mos., Sultan—Finette; Louis Cook's Finette, orange and tawny, 1½yrs., Fox— ——. Very high com., Louis Cook's Barri, white and lemon, 1½yrs., —— —Finette, and W. H. Sutherland's Bruno, white, 4yrs.

Class 3. Newfoundlands.—1st, withheld; 2d, Charles Jacquemin's Nig, black, 15mos., Frank—Nell.

Class 4. Greyhounds.—1st, Geo. S. Parvin's Major, mouse, 1¾yrs., Prince—Gipsy; 2d, William G. Smith's Major, white and fawn, 1½yrs., —— —Lady. Very high com., William H. Campbell's Pedro, black, 2yrs. High com., Edward Wooldridge's Flora, black, 11yrs., and M. Schrank's Gipsy, fawn, 4yrs. Com., Bayard Taylor's Cricket, liver, 5mos., —— —Fanny.

Class 5. Scotch Deerhounds.—1st, Clover Nook Kennel's Ray, brindle, 2yrs., Paddy—Lassie; 2d, J. M. Taylor's Dick, gray, 2½yrs. Very high com., Henry C. Spellman's Queen, light brindle, 3yrs.

Class 6. Champion English Setters, Dogs —Absent.

Class 7. Champion English Setters, Bitches.—1st, Dido II., black, white and tan, 3yrs., Druid—Star.

Class 8. English Setters, Dogs.—1st, J. Kline's Dick Bee, white, black and tan, 2yrs., Paris II.—Romp; 2d, John Overman's Count Gladsome, white, black and tan, 2yrs., Gladstone—Leila. Very high com., C. B. Phips's Royal Lothair, black, white and tan, 3yrs., Racket—Kelp, and Thos. L. Martin's Maxwell, black, white and tan, 5yrs., Luke—Rene. High com., W. R. Traver's Rocket, A.K.R. 118. Com., Hugh Hill's Royal Sultan, blue belton, 3yrs., Racket—Kelp. A. G. Wetherby's Dick, lemon and white, 16mos., Rex—Kate, and L. G. Hanna's Don, black, white and tan, 2½yrs., Foe—Pach.

Class 9. English Setters, Bitches.—1st, John E. Long's Nettie B., black, white and tan, 2yrs.; 2d, Ontario Kennel Club's Flora Bee, black, white and tan, 2yrs., Paris II.—Romp. Very high com., John Shrink, Jr.'s Joan of Arc, blue belton, 4½yrs., Leicester—Pearl, and Geo. W. Law's Faustina Lava Rock, white and lemon, 1yr., Lava Rock—Lady Beaconsfield. High com., Wm. C. Howard's Lucy D., blue belton, 5yrs., Paris—Coomassie. Com., W. E. Mitchell's Brownie, black, white and tan, 1½yrs., Dorman's Racket—Rose, and Ontario Kennel Club's Dinah, black and white, 18mos., Mark—Betsey.

Class 10. English Setter Puppies.—1st, P. B. Spencer's Dan, black and white, 10mos., Chief—Nancy Lee; 2d, G. W. Schulter's Rex, black, white and tan, 7mos., Count Gladstone—Melissa. Very high com., J. A. Oskamp's Lady Nonpareil, black, white and tan, 6mos., Count Noble—Rosalind. High com., H. L. Kyler's Slip, black and white, 10mos., Royal Lothair—Nonie.

Class 11. Champion Black-Tan or Gordon Setters.—1st, Franklin Kennel's Rupert II., 4yrs., Rupert—Queen.

Class 12. Black-Tan or Gordon Setters.—1st, John E. Long's Hugo, 8yrs.; 2d, Alex Jeffrey's Mack, 9yrs. High com., Geo. C. Miller's Rube, 8yrs., Rip—Nell.

Class 13. Black-Tan or Gordon Setters, Puppies.—1st, Phil Trottner's Frank, 8mos.

Class 14. Champion Irish Setters, Dogs.—Absent.

Class 15. Champion Irish Setters, Bitches.—1st, J. S. McIntosh's Lady Clare, 5yrs., Elcho—Rose.

Class 16. Irish Setters, Dogs.—1st, Henry Overman's Norwood, 3½yrs., Elcho—Rose; 2d, A. S. Knoblaugh's Barney, 3yrs. Very high com., John C. Sherlock's Brag, 7yrs., Bob—Duck. High com., W. P. Biddle's Bob, Jr., 2yrs., Bob—Flash. Com., Geo. C. Walker's Joe, 2yrs., Kent—Dance.

Class 17. Irish Setters, Bitches.—1st, E. F. Weiss's Clara Belle, 2¾yrs., Bob—Flash; 2d, J. A. Sullivan's Effie, 3½yrs., Tollstone—Ruby II. Very high com., Dr. Chas. I. Keely's Clytie, 7yrs., Elcho—Fire Fly. High com., J. Shelley Hudson's Virginia Reel, 3yrs., Kent—Dance.

Class 18. Irish Setters, Puppies.—1st, H. C. Bradley's Lotta, 9 mos., Norwood—Nellie; 2d, J. P. Heister's Beauty Belle, 8 mos., Norwood—Clara Belle.

Class 19. Champion Pointers, Dogs.—1st, Norbury Kennel's Bravo, A.K.R. 559.

Class 20. Champion Pointers, Bitches.—1st, H. W. Fawcett's Marguerite II., liver and white, 4½yrs., Faust—Devonshire Lass.

Class 21. Pointers, Dogs (over 55lbs.).—1st, John W. Munson's Meteor, liver and white, 3yrs, Garnet—Jilt; 2d, Dalliba & Munhall's Joe, liver and white, 2smos., unknown. Very high com., Mrs. John Schrink, Jr.'s Lamplighter, liver and white, 5yrs., Ranger—Queen, and C. M. Munhall's Donald, liver and white ticked, 18mos., Donald—Devonshire Lass. High com., Geo. W. Fisher's Icicle, A.K.R. 82, and A. A. Thomas's Bolus, liver and white, 2yrs., Bodine—Dare. Com., John W. Munson's Bang, liver and white, 4yrs., Bang—Luna.

Class 22. Pointers, Dogs (under 55lbs.).—1st and 2d, A. A. Thomas's Perry and Riot, liver and white, 18mos., Lort—Lass.

Class 23. Pointers, Bitches.—1st, John W. Munson's Vanity, liver and white, 3yrs., Bang—Pinette; 2d, B. F. Settner's Lady Croxteth, liver and white, 2yrs, Croxteth—Lass. Very high com., John W. Munson's Flash III., liver and white, 2yrs., Bang—Pride; and Spin-

away, liver and white, 3yrs., Garnet—Keswick; and E. F. Stoddard's Trinket, liver and white, 5yrs., Tory—Jaunty. High com., B. F. Seitner's Lass, lemon and white, 3yrs., Sensation—Rose. Com., John R. Daniel's Fan, lemon and white, 3yrs., Duke—Nell; Chas. Rule's Margaux, liver and white, 18mos., Faust—Musette; and Westminster Kennel Club's Moonstone, liver and white, 5yrs., Bang—Luna.

Class 24. Pointers, Puppies.—1st and 2d, B. F. Seitner's Rapp and Doncaster, liver and white, 11mos., Croxteth—Lass. Very high com., Dalliba & Munhall's Dora, liver and white, 11mos., Sensation—Devonshire Lass, and E. F. Stoddard's Glen, white and liver, 9mos., Bodine—Lady. High com., Luck & Thornton's Bob L., liver and white, 7mos., Bodine—Bell. Com., J. A. Oskamp's Grace, liver, 4½mos., Sport—Corley, and Luck & Thornton's Bowlander, liver and white, Bodine—Bell.

Class 25. Irish Water Spaniels.—No entries.

Class 26. Field Spaniels (over 28lbs., any color).—1st and very high com., Hornell Spaniel Club's Hornell Rattler, chestnut and tan, 11mos., Dandy—Dinah, and Hornell Baroness, black and tan, 2¾yrs., Baron—Queen; 2d, Surrey Kennel's Success, black, 3¾yrs., Bachelor—Salus.

Class 27. Cocker Spaniels (any color).—1st and 2d, Hornell Spaniel Club's Hornell Daisy, liver, 2yrs., Benedict—Flirt, and Hornell Silk, black, 1½yrs., Obo—Chloe II. Very high com., Hornell Spaniel Club's Hornell Dinah, A.K.R. 66, and Dr. J. S. Niven's Black Bess, A.K.R. 516. Com., Mrs. J. Frank Wilson's Rose, brown, 9mos., Colonel—Belle.

Class 28. Foxhounds.—1st, Dan O'Shea's Ringwood, black, white and tan, 4yrs., Forester—Lady; 2d, Louis Rinninsland's Girl, black and tan, 2yrs. Very high com. and com., A. B. Whitlock's Lot, white and lemon, 3yrs., Dick—Cloudy, and Clara, white and lemon, 2yrs., Dick—Patti.

Class 29. Beagles.—1st and 2d, Dan O'Shea's Rattler and Music II., black, white and tan, 1½yrs., Rover—Music. Very high com., Mrs. Alice N. Taylor's Major T., black, white and tan, 3yrs., Rattler—Flora.

Class 30. Dachshunde.—1st, B. F. Seitner's Prince, fallow red, 1yr., Bergman—Gretchen; 2d, Harry L. Goodman's Waldine III., red, 2yrs., Bergman—Gretchen.

Class 31. Champion Fox-Terriers.—1st, Frank C. Wheeler's Lyra, white, black and tan, 14mos., Fennel—Fay.

Class 32. Fox-Terriers, Dogs.—1st, Chas. E. Wallack's Lancelot, white, black and tan, 2yrs., Tweezers II.—Olive; 2d, Surrey Kennel's Flippant, 2¾yrs., Royal—Tussle.

Class 33. Fox-Terriers, Bitches.—1st, Dan O'Shea's Tip, black, white and tan, 2yrs.; 2d, withheld. Com., H. F. Wood's Nancy, black, white and tan, 1½yrs., Trickster—Fanny.

Class 34. Fox-Terriers, Puppies.—1st, Clover Nook Kennel's Clover Belle, white, black and tan, 7mos., Akeley Joe—Guilty; 2d, withheld. High com., Herman T. Groesbeck's Judge, white, black and tan, 10mos.

Class 35. Champion Collies, Dogs.—1st, Thomas H. Terry's Robin Adair, A.K.R. 892.

Class 35½. Champion Collies, Bitches.—1st, Thomas H. Terry's Effie, red sable, 4yrs., Trefoil—Maude.

Class 36. Collies, Dogs.—1st, Edith M. Fasig's Mac, black, white and tan, 11mos.; 2d, R. Folsom's Cheviot II., black and tan, 1yr., Cheviot— ——. Very high com., Chas. Leggat's Major, black and tan, 8mos., Collie—Fanny.

Class 37. Collies, Bitches.—1st and 2d, withheld. Very high com., Chas. Leggat, Jr.'s Gypsie, black and tan, 8mos., Colhe—Fanny.

Class 38. Bulldogs.—1st, R. & W. Livingston's Boz., A.K.R. 443; 2d, J. J. Walker's Pungo, fawn and white, 4yrs., Cure—Meg. Very high com., J. P. Barnard's Hamlet, brindle, 16mos., President Garfield—Pearl of Fortune.

Class 39. Bulls, Bitches.—1st, R. & W. Livingston's Sweet Briar, A.K.R. 444; 2d, withheld.

Class 40. Bull-Terriers.—1st, Frank C. Wheeler's Young Bill, A.K.R. 196; 2d, Geo. Keller's Chip, white, 3yrs. High com. and com., J. J. Walker's Beauty, white, 1½yrs., Spring— ——, and Senator, white, 3½yrs., Jack—Daisy.

Class 41. Black and Tan Terriers (over 7lbs).—1st, Mrs. A. Kistemann's Spring, 2yrs; 2d, withheld.

Class 42. Bedlington Terriers.—No entries.

Class 43. Skye Terriers.—1st, J. J. Walker's Creeper; 2d, withheld.

Class 44. Hard-haired Scotch Terriers.—1st, John H. Naylor's Tam Glen, dark gray, 18mos., Wallace—Flora; 2d and very high com., Dan O'Shea's Boxer, wheaten, 2yrs., Major—Lady, and Lady, red, 5yrs.

Class 45. Irish Terriers.—1st, Dan O'Shea's Erin, red, 2yrs, Rock—Norah; 2d, Dr. J. S. Niven's Norah, red, 4yrs, Spring—Nettie.

Class 46. Yorkshire Terriers.—1st and 2d, Mrs. A. Kistemann's Hero, 4yrs., and Sandy, 3yrs. Very high com., Mrs. A. Kistemann's Lillie, 2yrs; Miss Maggie Burke's Robert Bonner, 3yrs, Tom—Bess; and Miss J. A. Skinner's Sir Robert, 5yrs. High com., Thos. Axworthy's Tiny, 2yrs, and Carrie Flock's Tiny, 1yr. Com., J. Englehart's Lena, 15mos., Bab—Minnie.

Class 47. Champion Pugs.—1st, Mrs. Geo. H. Hill's Joe, 4yrs., Comedy—Clytie.

Class 48.—Pugs.—1st, J. Englehart's Bo Peep, 2½yrs, Fritz—Minnie May; 2d, Mrs. A. Kistemann's Sambo, 1½yrs. Very high com., Herman J. Groesbeck's Lady Elmore, 10mos., Andy—Lady Willoughby; Mrs. A. Kistemann's Punch, 2yrs., and Harry L. Goodman's Judy III., 3yrs., Royal Dandy—Judy II. High com., Miss Ida Englehart's Minneapolis Sooty, 3½yrs., Sooty—Dinah; A. W. Whelpley's Lady Digby, 10mos., Andy—Lady Willoughby, and Robert Wright's Polly, 5mos., Andy—Cora. Com., R. C. Anderson's Burnie B., 1yr., Sooty II.—Judy.

Class 49. Toy Terriers (under 7lbs.).—1st, Nick Mackley's Lotta, black and tan, 1½yrs.; 2d, Mrs. A. Kistemann's Flora, tan, 2½yrs. Very high com., Mrs. G. Gandolfo's Busy, black and tan, 1yr., and Miss Minnie Farrell's Bunnie, blue and tan, 2½yrs. High com., Frank Seifert's Bill, black and tan, 1½yrs. Com., J. Englehart's Fanny, black and tan, 2yrs., Zac—Fanny, and Mrs. J. Englehart's Skye II., blue and tan, 1yr., Tony—Skye.

Class 50. King Charles, Blenheim and Japanese Spaniels.—1st, Mrs. A. Kistemann's Charlie, black, white and tan, 2yrs.

Class 51. Miscellaneous.—Equal 1st, J. Englehart's Gyp, white and fawn Italian greyhound, 1½yrs.; Peter Schwein's Hans, black Caniche poodle, 2yrs., and R. Neff's Jack, blue and gray Dandie Dinmont terrier, 9mos.

SPECIAL PRIZES.

Class A.—For the best setter or pointer, W. B. Shattuc's Dido II.

Class B.—For the best English setter, W. B. Shattuc's Dido II.

Class C.—For the best matched brace of English setters, Ontaria Kennel Club's Dinah and Pearl.

Class D.—For the best Gordon setter, John E. Long's Hugo.

Class E.—For the best Gordon setter dog in open class, John E. Long's Hugo.

Class F.—For the best Irish setter, Henry Overman's Norwood.

Class G.—For the best Irish setter puppy owned in the counties of Hamilton, O., and Campbell and Kenton, Ky., H. C. Bradley's Lotta.

Class H.—For the best pointer bitch puppy owned in Cincinnati, J. A. Oskamp's Grace.

Class I.—For the best pointer, John W. Munson's Meteor.

Class J.—For the best pointer sired by Beaufort, Charles Rule's Sylph.

Class K.—For the best kennel of five pointers, John W. Munson.

Class L.—For the best brace of pointers, John W. Munson's Meteor and Vanity.

Class M.—For the best pointer dog, owned by a lady in Cincinnati, Mrs. John Schrink's Lamplighter.

Class N.—For the best kennel of five field and cocker spaniels, Hornell Spaniel Club.

Class O.—For the best cocker spaniel dog or bitch, Hornell Spaniel Club's Hornell Daisy.

Class P.—For the best cocker spaniel dog, Hornell Spaniel Club's Hornell Silk.

Class Q.—For the best collie, dog or bitch, Thos. H. Terry's Robin Adair.

Class R.—For the best pug, owned by a lady in Cincinnati, Mrs. Geo. H. Hill's Joe.

Class S.—For the best small non-sporting dog, owned by a lady in Cincinnati, Miss Maggie Burke's Robert Bonner.

Class T.—For the best non-sporting dog, owned by a lady in Cincinnati, Miss Maggie Burke's Robert Bonner.

Class U.—For the best black and tan terrier, Mrs. A. Kistemann's Spring.

Class V.—For the largest and best display of non-sporting dogs owned by a resident of Cincinnati, J. Englehart.

Class W.—For the best pug owned by a lady in Cincinnati, Mrs. Geo. H. Hill's Joe.

Class X.—For the best Yorkshire terrier owned by a lady in Cincinnati, Miss Maggie Burke's Robert Bonner.

Class Y.—For the best Italian greyhound owned by a lady in Cincinnati, Mrs. S. B. Kelly's Daisy.

Class Z.—For the best terrier owned by a lady in Cincinnati, Miss Maggie Burke's Robert Bonner.

Class AA.—For the best pug in the open class, J. Englehart's Bo Peep.

Class BB.—For the best fox-terrier, Nick Mackley's Lotta.

Class CC.—For the best terrier, Frank C. Wheeler's Young Bill.

Class DD.—For the best decorated kennel, Geo. W. Pickard.

Class EE.—For the best pointer dog entered by a resident of Cincinnati, Newport or Covington, Mrs. John Schrink, Jr.'s, Lamplighter.

Class FF.—For the best large pointer dog entered by a resident of Cincinnati, Newport or Coviugton, Mrs. John Schrink, Jr.'s, Lamplighter.

Class GG.—For the third best dog or bitch in the mastiffs, St. Bernard, pug, Yorkshire, toy and two in the miscellaneous classes, Geo. H. Hill's Guinare, Louis Cook's Barri, Harry L. Goodman's Judy III., Miss Maggie Burke's Robert Bonner, Mrs. Gandolfo's Busy, Geo. Ellis's Charlie and J. Englehart's Pedro.

Class HH.—For the best pug that has never been exhibited, owned by a lady in Cincinnati, Miss Ida Englehart's Minneapolis Sooty.

Class II.—For the best small pointer dog, owned by a lady in Cincinnati, Mrs. Thos. T. Gaff's Fred.

Class JJ.—For the best large pointer, owned in Cincinnati, that has never won a prize, J. A. Oskamp's Sport.

Class KK.—For the best pointer, owned in Cincinnati, J. A. Oskamp's King Alphonso.

SETTERS AND POINTERS AT CINCINNATI.

THE dog show opened on Tuesday morning, the 4th inst., with 289 entries. Melodeon Hall, where the show is held, is in all probability the worst place in America for a dog show, but it was the only available hall to be had at this time. It is a sort of concert hall or theater—on the third floor—and the approach to it is up two and a half flights of stairs from a side street. The room is very small, and the kennels are so closely packed in it that two persons can hardly pass in the aisles. There is no yard or lot attached to it for exercising the dogs, and such as are taken out, must be carried into the public street. I wonder how Mr. Lincoln has done as well as he has under the circumstances. Everything moves on with the good order which he alone could bring out of such a condition of things. The judging is done on a raised stage, where it is so dark that gas is kept burning all the time. When the crowd stands around the front of the stage the dogs have to be handed on and off the stage over the heads of the spectators. I noticed the hall was very warm all during the show, and I fear that many of the dogs will be made sick. Financially the show will be a success. On the first day there were over seventeen hundred paid admissions at the door, and a good crowd has been in daily attendance.

Major Taylor and Mr. Mortimer judged a few of the classes on Tuesday, but most of the judging was done on Wednesday. The quality of the setters and pointers is far above the average, and the classes filled well. I can't say a word as to the quality of the other sporting and all the non-sporting classes, for I don't know enough about any of them to dare to comment. My report must, therefore, cover setters and pointers only.

Champion English Setter Dogs.—Lava Rock, the only entry, was absent.

Champion English Setter Bitches.—Gen. Shattuc's Dido II. was the only entry, and won the prize. It will be a very cold day when the little lady gets left if the General shows her.

English Setter Dogs—Had sixteen entries. First went to Dick Bee, owned by the Mohawk Kennel of Chatham, Canada. He is a very taking black, white and tan, by Paris II., out of Romp, and well deserved the prize. Count Gladsome, owned by John Overman of Cincinnati, won second. He is white, black and tan also, by Gladstone out of Leila, and a very handsome dog. Royal Lothair, owned by C. B. Phipps of Winton Place, O., by Racket out of Kelp, and Maxwell, owned by T. L. Martin of Lexington, Ky., by Luke out of Rene, both good show dogs, won vhc. Rocket, owned by W. R. Traver, Washington, D. C., another black, white and tan, by Wagoner out of Nell, got hc. He is a fair dog. Royal Sultan, blue belton, by Racket out of Kelp; Dick, a lemon and white, by Rex out of Kate; and Mr. L. G. Hanna's (Cleveland) Don, a black, white and tan, by Joe out of Patch, each got c. Major Taylor seems to be fond of the black, white and tans, or may be I only thought so, because with two exceptions the honors in this class went to dogs of that color, but I think they were all properly placed. The fact is black, white and tan is the fashion among setter men now, and there are more of them to be shown than of other colors.

English Setter Bitches.—In this there were thirteen entries, and they were an excellent lot. Maj. Taylor had his little field trial champion Lit "for exhibition only" in this class, but he need not be ashamed to show her for competition under any other judge, for she is a little beauty. First prize went to John E. Long's (Detroit) Nettie B., a black, white and tan, no authentic pedigree. Mr. Long bought her from a butcher in Detroit and thinks he traces her pedigree to a dog over in Canada, but as there is an uncertainty about it, he declines to manufacture a pedigree for her. She is evidently a blue blood, for she is full of quality and style, and deserved her first. The Ontario Kennel Club's (Chatham) Flora Bee won second. She is a sister to Dick Bee, the dog that won first in the preceding class, and is by Paris II. out of Romp. Vhc. went to Joan of Arc, a blue belton, by Paris out of Pearl, and to Faustina Lava Rock, a lemon and white, by Lava Rock out of Lady Beaconsfield; both are good bitches. Hc., was won by Lucy D, a blue belton, by Paris out of Coomassie, and c., by Brownie, black, white and tan, by Racket out of Rose, and Dinah, black and white, by Mark out of Betsy, both fair.

English Setter Puppies.—First to Dan, entered by P. B. Spencer (Newport, Ky.), a black and white, by Chief out of Nancy Lee. He is by far the best puppy in the class; second went to Rex, a black, white and tan, entered by G. W. Schuler (Hamilton, O.), by Count Gladstone out of Melissa. His head is poor, otherwise a good pup. Vhc., to Lady Nonpareil, a black, white and tan, by Count Noble out of Rosalind. She is a poor-looking young one with no apparent substance, and bad, sore eyes. Hc., to Slip, a black and white, by Royal Lothair out of Nonie.

Champion Black and Tan Setters.—First to Rupert II., entered by Franklin Kennel, O., a dog I don't fancy, and certainly not a Malcolm standard dog. Argus, the only other entry, was absent.

Black and Tan Setters.—Seven entries. No good ones, and no Malcolm standard dogs in the lot. First to John E. Long's Hugo, the best in the lot; second to Mack, an old ugly looking dog. Major Taylor wisely withheld other notices from the class except one hc. to Rube, a poor dog.

Black and Tan Puppies.—Only one entry and a poor one, Frank, who won first.

Champion Irish Setter Dogs.—Only one entry, Biz, who was absent.

Champion Irish Setter Bitches.—Only one entry, J. S. McIntosh's Lady Clare.

Irish Setter Dogs.—Fourteen entries and a very fair class. First to Norwood, entered by H. Overman, Cincinnati, a very handsome dog, by Elcho out of Rose, fit to show in any company; second to Barney, by Dash out of Clee, entered by A. S. Knoblaugh, Cincinnati, a fair dog. Vhc. to Brag, by Stoddard's Bob out of Duck, better to my mind than the winner of second. Hc. to Bob, Jr., by Stoddard's Bob out of Flash. C. to Joe, by Kent out of Dance. Major Taylor failed to notice Wagg, a very handsome big dog, by Snipe out of Fan, who should have had a place.

Irish Setter Bitches.—Seven entries. Only a fair lot. First to Clara Bell, entered by E. F. Weiss (Cincinnati), by Stoddard's Bob out of his Flash. She was the best in the class. Second to a very good-looking bitch, Effie, by Tollstone out of Ruby. Vhc. to Clytie, by Elcho out of Fire Fly. I liked her for second. Hc. to Virginia Reel. Not a good bitch.

Irish Setter Puppies.—Four entries, and they did not amount to much. First to H. C. Bradley's (Cincinnati) Lotta, by Norwood out of Nellie. Second to Beauty Belle, by Norwood out of Clara Bell. I predict that Norwood will prove a good stud dog if allowed a fair lot of bitches.

Champion Pointer Dogs—Had three entries, first going to the Baltimore dog Bravo, over John E. Long's King Tom and the Knickerbocker Kennel Club's Knickerbocker. The award was correct, though neither dog is particularly good, to my mind. I don't mean that they are bad, but that they are not good enough to win in the best company.

Champion Pointer Bitches.—Had three entries and only two present—the Westminster Kennel Club's Lassie, and Mr. H. W. Fawcett's Marguerite II., by Faust out of Devonshire Lass. The latter took the prize deservedly. Lassie is not a good show bitch, and is not now in show form.

Pointer Dogs (over 55 pounds)—Had fourteen entries, and I heard Major Taylor say it was one of the best classes he ever judged. With two or three exceptions, I thought the lot very much above the average of large dogs. First went to imported Meteor, exhibited by me, and I don't think I misstate it when I say Major Taylor selected him for first as soon as he looked him over. To my mind he is ahead of anything in the show. I have only had him ten days—from his winter quarters in Texas, where Col. Hughes has had him at work daily—and he was not in good show shape, but he won his place with ease. The choice for second was a hard job for the Major, and took him a long time to decide. It finally went to Joe, a liver and white dog entered by Dalliba & Munhall, of Cleveland. He is a dog that was bought for $20, and has no pedigree. With the exception of his head, which looks like a bull-terrier's, he is a splendid looking dog. His chest is the deepest I ever saw on any pointer. He was sold after the award for $100. C. M. Munhall's Donald II., a liver and white ticked dog, by Donald out of Devonshire Lass, got vhc., which is as much as he deserved. He is too straight up and down in front to win in good company, but was shown in the pink of condition, thanks to Lewis, his handler. Lamplighter, a liver and white dog, by Dilley's Ranger out of Dilley's Queen, got vhc. also. He is a good looking, big dog, but very coarse, as are the general run of Ranger dogs. The much-advertised Icicle got hc., probably because Major Taylor did not want to break his owner's heart, but had I judged the dogs, he would not have been noticed. He is a big, ungainly looking dog, without a sign of quality to him. Bolus, a liver and white dog entered by A. A. Thomas, of Dayton, Ohio, got hc., and Bang, by old champion Bang out of Salter's Luna, entered by me, got c. Bang's breeding is all right, but he don't "show up" well. He is too stocky and thick, and lacks quality.

Pointer Dogs (under 55 pounds)—Had four entries. First went to Perry, a liver and white dog, entered by A. A. Thomas of Dayton, by Lort out of Lass. He is good, except his chest, which is entirely too thin. It is deep enough, but very thin. The owner of second, Riot, a brother of Perry and entered by same gentleman, with the exception of his nose, which is short, is to my mind the better of the two.

Pointer Bitches (any weight)—Had nineteen entries, and was a splendid class. First went to my imported Vanity, by old champion Bang out of Pride. I am vain enough to think the selection was easily made, for I like her better than any bitch I ever saw. Second was taken by Lady Croxteth, entered by B. F. Seitner, of Dayton. She is liver and white, by Croxteth out of Lass. I preferred her dam, Lass, who got hc. to her, though she is a showy, taking bitch, and handles well. I thought Trinket, entered by E. F. Stoddard, of Dayton, a better bitch; but she was shown in very bad condition, and would not have deserved to beat her as she now is. I also think my two bitches, Spinaway and Flash, third, better than Lady Croxteth—but I am very vain of my entries. They were given each a vhc. as well as Trinket. Seitner's Lass, hc., is a very handsome lemon and white bitch—better far than the average. Westminster Kennel Club's Moonstone, by Bang out of Luna, got c., and I don't think deservedly. She is not at all a show bitch. Their Polly failed of a place, though I like her better than Moonstone.

Pointer Puppies—Were a fair lot, only the winners of first and second, B. F. Seitner's Rapp and Doncastor, both by Croxteth out of Lass, deserved their places. They are a pair of very fine pups. Dalliba & Munhall's Dora, by Sensation out of Devonshire Lass, got vhc. She is also a handsome pup, liver and white. E. F. Stoddard got vhc. for his Glen, by Bodine out of Lady. The others were a fair lot.

The special prizes were numerous if not valuable. Special A was the best of the lot. It was a massive silver dog collar, with solid gold lock and trimmings, donated by the Cincinnati *Enquirer*. It was for the best setter or pointer, dog or bitch in the show, and brought out Dido II., Dick B., Nettie B. and Dan, all English setters, winners of first prize; Rupert II., champion Gordon; Hugo, first prize Gordon; Norwood, Clara Bell and Lotta, first prize Irish setters, and Bravo, champion pointer; Marguerite II., Meteor, Perry, Vanity and Rapp, all first prize pointers. The choice narrowed down to Dido and Meteor, and I can say unselfishly that no man in the show was more glad to see the prize go to Dido than I. She deserved it, and it is worth a fortune to her big-hearted owner.

Special B, for best English setter dog or bitch, a pair of leather leggings, donated by B. Kittridge & Co., went to Dido.

Special C, a picture for best matched brace of English setters went to Dinah and Lucy, the only entries.

Special D, for best Gordon setter dog or bitch, a pair of leggings donated by Kittridge & Co., went to Hugo. Rupert and Frank showed against him.

Special E, for best Gordon dog, bronze tobacco case went to Hugo.

Special F, for best Irish dog or bitch, a pair of leggings, went to Norwood, beating Lady Clare, Clara Bell and Lotta.

Special G, for best Irish puppy, went to Lotta, the only entry.

Special H, silver cup donated by Cincinnati *News Journal*, for best pointer puppy owned in Cincinnati, went to Grace.

Special I, pair leather leggings, donated by Kittridge & Co., for best pointer dog or bitch, went to Meteor.

Special J, for best pointer puppy sired by Beaufort, went to Sylph.

Special K, for best kennel of pointers, Ligowsky clay pigeon trap and barrel of clay pigeons, went to my kennel composed of Meteor, Bang, Spinaway, Vanity and Flash, beating Lady Croxteth, Rapp, Doncaster, Perry and Lass.

Special L, for best brace of pointers, went to Meteor and Vanity.

Special M, for best pointer dog owned and entered by a lady of Cincinnati, went to Lamplighter.

Special EE, silver medal for best pointer dog entered by a gentleman resident of Cincinnati, Newfort or Covington, as owner or agent, went to Lamplighter.

Special FF, same as preceding, a meerschaum pipe, went to Lamplighter.

Special II, for best pointer dog under 55lbs., owned by a lady of Cincinnati, went to Fred.

Special JJ, for best pointer dog owned in Cincinnati, and winner of no other prize, went to Sport.

Special KK, for best pointer dog puppy owned in Cincinnati, winner of no other prize, went to King Alfonso.

The show has drawn together a very nice lot of dogs for a beginning, and no doubt hereafter Cincinnati will have an annual show, and a good one. Quite a number of prominent owners and dog show patrons are here, too many to note in this letter. The judging seems to have given entire satisfaction, from all I can learn. The weather has been bad all during the show, but for which more money would have been taken in, but it is a success nevertheless.

Jno. W. Munson.

Cincinnati, March 6.

EASTERN FIELD TRIALS DERBY.—The annual Derby of 1884, of the Eastern Field Trials Club, open to all setters and pointers whelped on or after Jan. 1, 1883, promises to be the most important event of the kind that has yet taken place in this country. Nearly all of the prominent breeders throughout the country will send the pick of their kennels to compete for the honors of victory. The purse is $300, with $250 to first, $150 to second and $100 to third. In addition to this, there will also be several valuable specials offered. The entries will close May 1. For further particulars address Mr. Washington A. Coster, Box 30, Flatbush, Kings county, N. Y.

THE NEW HAVEN SHOW.

[Special Dispatch to Forest and Stream.]

NEW HAVEN, Conn., March 12.—The dog show commenced to-day under very favorable auspices. There are 385 entries. The arrangements for benching the dogs will compare favorably with those of our best shows. The building is roomy, well lighted and ventilated. There are a large number of local entries that make a good showing. The attendance is good for the first day, and there is no doubt that the show will be successful.

MR. D. C. SANBORN.

Editor Forest and Stream:

Please publish the inclosed resolutions of sympathy from the party who have often spent a very enjoyable time on the prairie with "Uncle Dave:"

It has pleased an all-wise Providence to take from among us our dear friend and beloved brother sportsman, D. C. Sanborn, of Dowling, Mich., and while we bow in reverent submission to the Divine will, we feel that one has been called away whose place will be hard to fill. His sterling qualities endeared him to all who enjoyed his acquaintance. He was kind to a fault, just though it were to his hindrance, and full of that ready wit and humor which always made him a welcome guest. To the family of our friend in this, the day of their sorrow, we offer the most respectful homage of our sympathy. B. F. WILSON,

EDWARD GREGG,	HOWARD HARTLEY,
J. W. ORTH,	E. B. GODFREY,
JOHN O. PHILLIPS,	S. L. BOGGS,
O. F. WHARTON,	W. A. NICHOLSON.

PITTSBURGH, Pa., Feb. 12.

N. A. K. C. DERBY.

Editor Forest and Stream:

I inclose a list of entries received to date for the sixth annual Derby of the National American Kennel Club. Purse, $500—$250 to first, $150 to second, $100 to third. Entries close April 1, with $5 forfeit. I will mail entry blanks free to all applicants. Will furnish you list of entries as fast as I receive them. D. BRYSON, Sec. N. A. K. Club.

MEMPHIS, Tenn., March 5.

N. A. K. C. DERBY, 1884.

ENTRIES.

DAISY BELTON.—J. R. Henricks, Pittsburgh, Pa., blue belton English setter bitch, Jan. 3 (Belton III.—Countess).

RODERIGO.—Gates & Merriman, Memphis, Tenn., black, white and tan English setter dog, April 11 (Count Noble—Twin Maud).

HAYDEE.—Gates & Merriman, Memphis, Tenn., blue belton English setter dog, April 11 (Count Noble—Twin Maud).

CAL COOL.—Gates & Merriman, Memphis, Tenn., black, white and tan English setter dog, June 30 (Gath—Lit).

NOT NAMED.—Gates & Merriman, Memphis, Tenn., black, white and tan English setter bitch, July 20 (Gladstone—Carrie J.).

QUEEN BESS.—B. F. Price, Memphis, Tenn., black, white and tan English setter bitch, June 28 (Gladstone—Donna J.).

LILLIAN.—P. H. & D. Bryson, Memphis, Tenn., black, white and tan English setter bitch, Aug. 21 (Gladstone—Sue).

GLADSTONE'S BOY.—Dr. G. G. Ware, Stanton, Tenn., black, white and tan English setter dog, Jan. 10 (Gladstone—Sue).

BILLY GATES.—Dr. A. F. McKinney, Forest Hill, Tenn., black and white English setter dog, Aug. 21 (Count Rapier—Kate B.).

SURREY.—W. B. Mallory, Memphis, Tenn., black, white and tan English setter dog, June 10 (Gath—Juno II.).

LADY LEE.—W. B. Mallory, Memphis, Tenn., black, white and tan English setter bitch, June 10 (Gath—Juno II.).

LEXINGTON.—W. B. Mallory, Memphis, Tenn., black, white and tan English setter dog, June 10 (Gath—Juno II.).

BASKET (OR FOOT) BEAGLES.

THE beautiful little basket beagle, ranging from twelve down to nine inches in height, who has heretofore been exhibited at bench shows together with their larger brothers of thirteen to fifteen inches in height, in one class, will at last have a separate class provided for them at the coming New York show, if the number of entries will warrant the making of such a class.

The necessity of two classes for beagles at our shows has been a want long felt, and as a friend, one of our best judges of beagles, said to me in a letter of recent date: "The best judge was in a quandary when called upon to award a prize to one of two beagles, respectively ten and fourteen inches in height, and of equal merit. If he was prejudiced against the one, he felt that he was doing injustice to the other, or *vice versa*. Two classes would abridge this difficulty, etc., etc." I quote from memory. Having consulted the opinions of several of our most prominent beagle men, and finding them all coincide with my own convictions, I laid this matter before the managers of the Westminster Kennel Club Bench Show, and the following is the reply I received:

NEW YORK, March 6, 1884.—*A. C. Krueger, Esq., Wrightsville, Pa.:* Replying to your favor of the 3d inst., the managers of the W. K. C. Bench Show request me to inform you that if there are enough entries of beagles under twelve inches to warrant making a separate class, they will do so and will award to the best of that class an extra medal.—CHAS. LINCOLN, Superintendent.

Now all ye owners of this admirable breed, it lies in your own hands to bring about this new era in beagle history, and I sincerely hope that you will add your mite by entering your little pets at the coming New York show, and thereby make this class a permanent fixture at all future shows. If this is done I think we can, with certainty, look for a champion, two open and a puppy class for beagles under twelve inches, in the near future.

The Westminster Kennel Club have also consented to accept and hand to their judges the standard of the American English Beagle Club, which will be ready about April 1, when it will appear in FOREST AND STREAM.

A. C. KRUEGER,
Sec'y and Treas. American English Beagle Club.

WRIGHTSVILLE, Pa., March 7, 1884.

A CANINE TRANSFORMATION.—*Editor Forest and Stream:* My family rejoices at present in the possession of two dogs; Nep, a Newfoundland, huge, black and curly; and Leo, likewise large and black, but straight-haired (both as to his coat and his treatment of his fellow creatures). Little two-year old Mabel and her mother were our guests the other morning at breakfast, and the child was much interested in Nep, who chanced to be in the house. After a time he departed, but to the astonishment of Mabel, the same dog, as she supposed soon walked in, with never a curl in his hair. "Why!" said the child, addressing Leo, "where's all you turls."—K. (Central Lake, Mich.)

CHAMPION DIDO II.—*Special Dispatch to Forest and Stream:* Cincinnati, O., March 10.—Please announce that Champion Dido II. will not be entered for competition this year. I do this in the interest of brother sportsmen, as I wish them to enter in the champion class, which they appear not willing to do while she is in competition.—W. B. SHATTUC.

ST. LOUIS DOG SHOW.—*Special Dispatch to Forest and Stream:* St. Louis, March 11.—It has been decided to hold a bench show of dogs here about the middle of April, under the auspices of the St. Louis Gun Club. The cash and special prizes will be sufficiently liberal to attract prominent dogs from a distance. Competent judges will be secured and the show properly managed. Every inducement will be offered to exhibitors to bring their dogs. Will send full particulars by mail.—J. W. MUNSON.

PHILADELPHIA DOG RACES.—Dog racing or running is coming to the front in Philadelphia. Dogs bred for this particular purpose with a certain amount of greyhound blood in their veins are employed. Two or three runs take place weekly, but the owners of these fleet-footed canines as a rule are those who patronize the prize-fighting ring, rat-killing matches, and bull-terrier fights, and the amusement will hardly ever be upheld by the refined sportsmen owing to the general surroundings.—HOMO.

CLEVELAND DOG SHOW.—Cleveland, O., March 8.—*Editor Forest and Stream:* We have extended the time for closing of entries till March 24. We do this on account of the Washington show, hoping that we may get many entries of the winners there.—C. M. MUNHALL, Secretary.

DOG LOST.—Mr. E. L. Mead, of West Winsted, Conn., has lost his orange and white English setter dog Mac. He weighs about 45lbs., his head is evenly marked and he has dark eyes and nose, there is more orange on one side than the other. Any information as to his whereabouts will be thankfully received by his owner.

CLUMBER SPANIELS.—Any gentleman owning a well bred Clumber spaniel will confer a favor by sending his address with description and pedigree of dog to this office.

SHOW ENTRY BLANKS.—Secretaries of bench shows should send premium lists and entry blanks to us as we frequently have calls for them.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

C. S., Falmouth, Mass.—Feed your dog with mutton broth and well cooked rice, and give after each meal lacto-pepsin.

F. P. C., Exeter, N. H.—Dogs are often troubled with warts in the mouth. Cut off the largest with scissors and touch with nitrate of silver daily until they disappear.

J. C. E., St. Catherine's, Ont.—Your dog is probably troubled with worms. Give on an empty stomach a dose of finely powdered areca nut, two grains for each pound of his weight; follow in two hours with a dose of castor oil.

C. B. M., Madison, Ga.—Write us a description of the trouble. Your puppies may have the mange, but we are inclined to the belief that they are only afflicted with a breaking out that is very common to puppies and that will disappear as they grow older.

READER, Williamsport, Pa.—1. We presume that your puppy has dew claws. If so we should advise you to take them off. 2. Your bitch can be hunted up to within a week or ten days of the time she is due to whelp if used carefully. 3. There is no work that treats exclusively upon training hounds.

W. W. C., Topeka, Kan.—Distemper assumes so many forms that it is impossible for any one to intelligently prescribe without an examination. It is always safe, however, to recommend careful nursing, a warm kennel, where plenty of pure air can be had, and in case of debility, tonics may be given.

Rifle and Tray Shooting.

FIXTURES.

First International Clay-Pigeon Tournament, at Chicago, Ill., May 26 to 31. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.

RIFLE POINTS.

Editor Forest and Stream:

I was much interested in the "Rifle Queries," by "J. J. P.," of Worcester, Mass., in your issue of Feb. 21, and somewhat disappointed in finding that no one had undertaken to answer any of them in the following issue. I may not be able to answer any of them, but hoping to stimulate a discussion I will venture a few remarks. First, in regard to the comparative effect of moving the wind gauge one-hundredth of an inch, or raising or lowering the peep sight the same distance, I believe there is no difference. The raising or lowering of the rear sight will make the same vertical variation on the target as the moving of the wind gauge will cause laterally. Theoretically it should be so, and my experience has taught me that it is so. Any one doubting it can easily test it by taking a rifle with sights 36in. apart, and after getting it sighted for the center of the bulleye at 200yds., set the wind gauge two points (one-twentieth of an inch) to the right, and fire a few shots, and note where the shots strike. Then raise the elevation five points (one-twentieth of an inch) and fire again, and see if the bullets do not strike as much above the center of the bullseye as they did to the left of it in the first trial. If the gun is held steady, and the wind does not change, the variation should be ten inches in either case. In practice I always set my wind gauge two points, and my elevation five points for ten inches at 200yds. The scale on the wind gauge being in fortieths of an inch, and on the peep sight in hundredths, makes the variation the same in either case.

Question Second.—In regard to the air space, my experience is this: A large air space will reduce the recoil, and cause the bullet to "upset" to such an extent as to bulge the barrel at the point the ball started from when struck by the exploded powder. I used a long-range rifle with 115 grains of powder, an air space of 9 inches and a 520-grain bullet, firing off-hand at 200-yard target. The recoil was very light, and the bullet struck the ground 180 yards from where I stood. I presume that a small air space would have the same effect, only in a lesser degree. An air space of one-eighth of an inch would not damage the gun, and its disadvantages might be more than offset by the advantage of having the bullet in front of the chamber when struck by the exploded powder. My theory is that the larger the air space up to a certain limit, the harder will be the blow on the base of the bullet.

Fourth Question.—I think it is best to lubricate the barrel, as I believe I can keep the barrel in a more uniform condition in match shooting in this way than in any other. If the barrel could be thoroughly dried after cleaning every time, then it would probably be better to use no oil; but I believe this is impossible in match shooting, especially in damp weather. In match shooting you are expected to fire promptly when your turn comes, and you do not have much time to dry your gun barrel with a multitude of consecutive swabs. In cloudy weather your swabs become wetter and wetter as the match progresses, and finally there is a sudden halt. Some one has challenged a shot. The flags are stuck up, and the markers appear on the embankment in front of the target, apparently mere pigmies at the distance of over half a mile. Finally they all disappear as suddenly and mysteriously as they made their appearance a few minutes before. Down go the flags, and Farrow gets his bullseye as usual. Now it is your turn to shoot. Your gun has been drying out slowly but surely. Where will the next bullet strike? You do not know. You screw up your elevation one point and fire. You take a long look through your friend's telescope, but no welcome signal greets your eye. The scorer calls out in a loud voice, "Miss for Mr. Blank." You do not pretend to hear him, oh, no, you are too busy cleaning your rifle. This is not a fancy sketch, but an actual experience at Creedmoor.

How different would have been the result if you had been oiling your rifle. You may argue that in that case your rifle would have contained oil and water, and the water would have dried out. So it would. But the oil would have stayed there, no matter how long the delay, and it is a matter of small consequence whether the small quantity of water stays there or not.

My plan is this: In damp weather I pass the wet brush through once; in hot, dry weather twice. Then follow with three linen wipers, in the same order every time; then a woolen rag saturated with pure neat's foot oil (not too much oil), then a woolen rag to wipe out the superfluous oil. As the match progresses, your oil rag becomes depleted gradually, but the last swab takes up a portion of the oil, and your barrel remains about the same throughout the match.

Fifth question—If the wind gauge were on the grip or heel, in shooting in strong cross wind the peep sight would be so much to one side as to necessitate an unnatural position of the head and spoil the shooting.

Sixth.—If the bullet fits the gun it may be pushed in from the breech with a plunger, and must take its proper position, but if it be a little too small to fit the bore snugly, I do not believe that accurate shooting can be done with it by any possible style of loading, whether it be pushed in at the breech, rammed down from the muzzle, or forced into a small mouthed shell, and shot in the form of fixed ammunition. I have experimented considerably with this style of bullet, and never obtained any satisfactory results from it. A bullet that is a little too large to be an accurate fit may give good results, but a bullet that is a trifle too small is an abomination.

Seventh.—If you lubricate the bore, the patch is not liable to strip in loading from the muzzle or breech, if ordinary care is exercised. If the bore is wet, or dry, and not lubricated, the patch may strip partially, or entirely off the bullet, before its proper time, especially when loading at the muzzle. If no lubricating disc is used I think the patch will leave the bullet close to the muzzle of the gun, but I have known a lubricating disc and part of a patch to follow a bullet for a distance of 200yds. I believe that a thick pasteboard wad between the lubricator and bullet will prevent this.

Eighth.—I have questioned several experts on this point, and never found two to agree. Neither have I ever succeeded in finding a man who seemed to be sure that he knew much about it. If any long-range expert knows anything about it, will he be kind enough to tell us what he knows?

Ninth.—I use the Hazard Kentucky rifle, sea shooting, FG powder, and have always been of the opinion that it gave uniform results. All the powder taken from one keg would shoot the same place, but every time I got a new keg, I found it was stronger than the preceding keg, and I was compelled to make out a new list of elevations. This has been the case until recently, say the past two years, I have found no material change in the strength of the powder. The powder of to-day requires a much lighter elevation at 200yds., and a much lower elevation at 1,000yds., than the powder of five yeaas ago, although it is the same identical brand, Hazard FG. I am quite positive on this point, as I am using the same rifle and the same flask, and a reference to my old score books must be considered positive evidence. I have no desire for a stronger powder than the Hazard FG of recent manufacture. It gives a reasonably flat trajectory, and the recoil is quite sufficient to enable marksmeh to know for a certainty whether or not his gun has missed fire. I believe that a heavy recoil is very damaging to close shooting, for the marksman will always involuntarily brace up to such an extent every time he is about to pull the trigger, that his rifle will be deflected from its proper position just at the critical moment when it is absolutely necessary that it should remain immovable as a rock. E. A. L.

NORRISTOWN, Pa., March 7.

RANGE AND GALLERY.

SARATOGA RIFLE CLUB, March 6.—Following please find the highest score of each member of the Saratoga Rifle Club, shot during their regular Wednesday and Saturday shoots last week; Massachusetts target; off-hand; 200yds.:

THE N. R. A.—At a meeting of the Board of Directors of the National Rifle Association, held March 4, Colonel John Ward was chosen as secretary and Colonel John G. Scott was elected an honorary director for life. The following committee for the ensuing year were appointed: Finance, Colonel H. L. Cooper (vice, Captain Ackerman and Major Fincke; On Ranges, Colonel J. G. Story, General Charles S. Robbins and Captain E. L. Zalinski. At the suggestion of Mr. J. H. Brown a resolution was passed that a committee be appointed to draw up plans for five matches, to be known respectively as the President's match, the Governors' match, the Merchants' match, the Bankers and Brokers' match and the Manufacturers' match; that this committee be directed to appeal to the Governors of the different States, merchants, bankers, brokers and manufacturers throughout the country asking them to interest themselves in the matches and donate prizes therefor by way of suitable encouragement to the citizen soldiery "who are the great protectors of the general safety and property;" that the committee be further directed to make arrangements for the public presentation of the prizes and seek to induce the President of the United States and the Governors of as many States as possible to take part in the presentation. After it had been decided that the Executive Committee, in conjunction with Mr. J. H. Brown, the proposer of the resolution, should attend to this matter, the meeting adjourned.

NEW YORK GALLERY SHOOTING.—The White Elephant Rifle Range, Broadway, between Thirtieth and Thirty-first streets, has become famous for remarkable rifle shooting, and the old-time shooters have been left far in the rear by the marksmanship of some of the experts of to-day. This gallery has all the modern improvements, and is the most complete the veteran Conlin ever constructed. Following are a few of the scores of many similar ones since the opening of the year:

Off-hand, 200-yard target, 10 shots; possible 50.—Wm. Hayes 50, Fred Kuhnle 50, Chas. W. Minon 49, Wm. Blake 49, Dr. O. Adelberg 49, F. T. Broun 48, Col. H. F. Clark 50, E. E. Tiffany 50, Foxhall R. Keene 49, M. J. McGrath 49, John H. Gregg 48, C. S. Johnston 48.

Off-hand, 200-yard target, 7 shots; possible 35.—R. B. Coleman, M. D., 35, A. B. Smith 35, Fred. J. Allien 34, D. Piole 33, H. G. P. McIlage 35, G. W. Grenzer 35, Wm. S. Young, Jr., 31, D. G. Young 33. Lieut. F. P. Fremont 30 bulls in 35 shots, with 32 cal. rifle.

200-yard target, 10 shots, rest.—G. N. Bliss, Chas. Matthews, T. E. Soule, J. S. Tucker, R. Lockhart, C. A. Lummis, F. S. D. Forest, full score each.

300 yards, 7 shots, rest.—Thos. Doolittle, F. E. Moser, Chas. Lynch, Chas. S. Cohens, C. A. Tucker, A. Robbins, Dr. L. McNamara, A. F. Wendt, C. H. Barnes, Dr. F. N. Boynton, Walter E. Livingston, P. Rhinelander, W. C. Popper, H. Dunman, J. G. Robertson, W. Arnold, D. J. J. Robertson, W. G. Nesson, J. H. Mathews, full score each.

At 500-yard target, rest; possible 35.—F. A. Aramayo 35, Thos. Doolittle three full scores, W. J. Barker 33, W. J. Hughes 33, P. E. Merritt 35, A. Salvini 34, H. P. Gardner 33. E. E. Tiffany 50, possible 50.

COLLINSVILLE, Conn., March 5.—Canton Rod and Gun Club Riverside Range, 3lbs. pull, 10 shots, Mass. target.

D R Lewis	11	7	7	11	9	8	9	10	10	7—89
O B Hull	11	11	11	11	10	12	9	10	8	11—103
B I Dwell	11	10	10	10	10	12	9	10	7	9—98
J D Andrews	8	11	10	11	10	10	12	9	11	11—103
S J Lyon	9	11	9	11	10	9	9	8	11	9—97
B O Higley	9	10	7	10	8	9	9	3	7	9—81
J Laubastein	8	11	10	9	10	9	7	5	9	9—87
G Barbour	8	11	10	12	12	10	10	10	9	7—99
J B Flint	10	9	9	9	11	5	10	10	12	8—93

Tie: O B Hull, 10 10 12—32; J D Andrews, 9 9 12—30.

AN INDOOR TOURNAMENT has been arranged by the Seppenfeldt Rifle Club, open to teams of five men from any organized rifle club or military organization in the United States. Entrance fee, $1 per man. Entrance fee to be made to W. Seppenfeldt, No. 15 East Houston street, New York, at any time prior to Monday, March 31. Two teams to shoot each evening, and the choice of evenings to be drawn by the captains. The team prizes to be a fine gold medal to the first, and a medal to the second team as extra prizes presented by the Seppenfeldt Rifle Club. Entrance fees will be divided with all the teams who enter. The money prizes will be arranged on the night of meetings of captains of teams. Each captain will be notified of the night of meeting. Weapon, any .22-cal. rifle, 3lbs. pull; 10 shots per man, with the privilege of two sighting shots, at 10-ring target. Other conditions those of the N. R. A. The contest to be shot at Judson's Rifle Gallery, 1373½ Broadway, New York. In case of ties in the aggregate, the teams tying will shoot off. All disputes that may arise shall be decided by a referee appointed by the captains, whose decision shall be final. Distance, 100ft.

A DOUBTING READER.—Springfield, Mass.—*Editor Forest and Stream:* In your issue of Jan. 31 I notice a communication from "H. H." that is so smooth and mild, and yet so full of rifle talk, that I had to read it over and over again. It came from Florida, and its assertions seem to almost carry the fragrance of the orange with them. We must all take off our hats to "thirty years ago." Then the muzzleloader was in its prime. This is the assertion that forces my obeisance: "At 200yds., with a reclining rest, I could put all my shots in a 2in. bullseye," and this with round ball and linen patch in a .38-cal. muzzle-loading rifle. How Major Merrill would like to see that target and put his calipers on every bullet, rub his hands in glee and shout again, "Muzzleloaders to the front." But I have to notice a question in "H. H.'s" letter. It is this, "Has the increasing twist been applied to any of our breechloaders?" This question throws a shadow of weakness over the communication that I much regret, for the uncharitable will say that "H. H." is not posted enough in rifle matters to make the assertion that he put all his bullets into a 2in. bull at 200yds.—REST SHOOTER.

ALBANY, Feb 28.—At the Rensselaerwyck range to-day the shooting was on Massachusets target, 3 scores of 7 shots. The best scores were as follows:

Wm E Fitch	11	12	9	12	10	11	11—77
	11	10	11	11	12	11	11—77
	11	12	10	11	11	12	12—79—233
Chas H Gaus	10	10	10	10	11	11	12—74
	12	11	12	10	12	10	11—78
	11	10	11	11	12	12	11—79—231

March 6.—The first competition in the American decimal match 200yds. was shot. We give the best scores:

Wm E Fitch	9	9	9	10	9	10	10	9	9	9—93
C H Gaus	8	9	8	9	10	9	9	9	9	9—89

BOSTON, March 8.—There are at the Mammoth gallery three solid silver, hand made badges, valued at $25, to be shot for by amateurs during the month of March. In three classes, rounds 10, the best five scores to win in each class or possible 250. Position off-hand, distance 150ft., Creedmoor targets. Following are scores made in first class the past week:

A B Loring	44	44	44	44	45—221
R Ford	44	44	44	44	45—221
R W Gardner	43	45	43	43	43—217

NEWTON RIFLE ASSOCIATION.—Newton, Mass., March 1.—The regular annual meeting of the Newton Rifle Association was held Saturday, March 1. The following officers were elected for the ensuing year: President, T. W. Stevens; Vice-President, Geo. Linder; Treasurer, J. E. Hills; Secretary, F. W. Stevens; Directors—J. G. Wildman, Geo. Strong, W. O. Edmonds, Jr., Dwight Boyden, Dr. E. Hitchcock, L. Edwin Chase, Geo. Linder, F. W. Stevens, J. E. Hills and M. C. Laffe. The club is a live one, and ready at all times for friendly contests with neighboring clubs, at either targets or clay-birds. Regular shoots will be held on club grounds every Saturday, at 2 P. M. Correspondence on club matters solicited.—TOM ALLEY.

BULL'S HEAD RIFLE CLUB.—Regular weekly shooting, Feb. 28; 12-ring target; possible, 120: M. Dorrler 119, G. Zimmerman 117, C. Rein 116, H. Holzmann 115, H. Hachmann 111, J. J. Schneider 110, A. Lober 109, A. Stolzenberger 107, J. F. Campbell 104, J. J. Jordan 103, S. Mehrbach 102, B. Walters 99, D. Holland 97, S. F. C. Weber 96, H. Zubiller 87, D. Louinskie 81, H. A. Wasmuth 78.—A. LOBER, Sec.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE BOSTON GUN CLUB.

THE fourth tournament of the Boston Gun Club brought out a large array of shooters, representatives from the Brunswick Club, Maine; Manchester Sporting Club, Exeter; Sportsman Clubs, New Hampshire; the Worcesters Sportsman, Malden (Mass.) Rifle, Suffolk Sportsman, Clinton, Brockton, Maynard and Watertown Gun Clubs, Massachusetts, being present to do justice and prove their skill. The gold badge team match, of course, attracted the most attention, visitors and sportsmen crowding in and round the spacious platform to witness each shooter doing his best for the honor of their respective clubs. The wingless messengers of peace were incessantly peppered at, though the traps being worked to their best made fine scores the exception. A southeast wind gave from the easterly trap stands very strong left-quartering birds, after the shoot, birds being recovered fully 80yds. from trap. Of course the right-hand birds were much shorter fight. The general distance being 45yds., shooters seemed agreed that no gun could be built to shoot too close, or powder thrown too strong for the birds thrown from these powerful traps. The wind, though varying little in strength, became a little colder through the day, necessitating a frequent visitation to the steaming hot coffee provided in the club-house. The scores are as follows, singles being from 18yds. rise, doubles 15; ties shot at straightaway 21yds, rise, miss and out; ties on doubles 18yds., one pair miss and out:

First Event, 7 single birds.

C H DeRochemont	1101100—4	J Decker	1111110—6
W J Perry	1111110—6	A Houghton	0011110—4
H W Eager	0111111—6	C A Gerrish	0111111—6
W H Allen	1111010—5	B F Johnson	1111010—5
A H Perry	0011101—4	L G White	1100001—3
O J Jenkins	0010110—3	T C Field	0101011—4
L Evans	1110011—5	J Nichols	1000001—2
C B Holden	0001100—2	H Severance	0010010—2
G A Sampson	0101011—4	A F Cooper	0011100—3
J Hart	0101010—3	D Kirkwood	1110111—6
R Schaffer	1111110—6	J S Sawyers	1111101—6

Ties—Eager and Gerrish first, Allen, Evans and Johnson second, Sampson and Houghton third, Jenkins and Cooper fourth.

Second event, 7 single birds.

De Rochemont	0111111—6	Hart	0011111—5
Evans	0101010—3	Nichols	0011011—4
Schaefer	1111111—7	A H Henry	1110000—3
White	0101000—2	A Sampson	0111100—4
Holden	1111101—6	Houghton	1110010—4
Decker	0101101—4	Kirkwood	1011111—6
Eager	1110111—6	Field	0011011—4

Field	1011000—3	A H Perry	0110110—4
Evans	1101011—5	Allen	0111101—5
W Perry	0011011—4	Howard	0100111—4
Eager	1111011—6	Sawyer	1000111—4
Nichols	1100111—5	C F Steele	1010100—3
Curtis	1001111—5	G F Locke	1110111—6
Williams	0000011—2	H Dunton	1110100—4
Holden	1111111—7	Taylor	1111111—7
Cutting	1000101—3	H C Warren	1101110—5
D Chambers	1000101—3		

Schaefer and Taylor first, Jenkins second, DeRochemont, Curtis and Warren third, W Perry fourth.

Sixth event—New England clay-pigeon, three men team badge, championship match. The Boston Gun Club giving a magnificently finished solid gold medal, of the value of $50. to the club getting the best aggregate of two scores out of six shoots. Conditions—A team to consist of three men from any organized club in the New England States, each club entitled to send two teams' scores, to consist of five singles from five separate and constantly re-pigeoned traps, three pair doubles from two traps, and ten single birds from a constantly altered trap, each team's score to be thus: 63 birds, singles to be shot from 18yds. rise; doubles, 15yds. rise; ties each day to be shot at one pair doubles and one single straightaway bird, meaning nine birds per team. If any tie exist on the total of two best scores, the teams shall shoot off at five straightaway birds and three pair doubles, or 33 birds per team. Entrance, $1 per man, the money on each day to be divided, 50, 35 and 15 per cent. to the clubs in usual rotation. One man can be changed if by sickness or inability to shoot on different days, but no change can be made by members from one team to another of same club. Not less than six teams to constitute a shoot.

First Worcester Team.

Five Traps.	Doubles.	Singles.
Eager 10101	10 11 11	1010010111—14
Holden 11110	10 10 01	1111111110—76
W S Perry 01011	10 11 00	1100001111—12—42

First Massachusetts Rifle Team.

De Rochemont 01110	10 00 10	1101111011—13
Emerson 01011	11 10 10	0100111011—13
Schaefer 11110	01 11 11	1011110111—16—42

Second Massachusetts Rifle Team.

Curtis 01101	00 11 01	1111011111—15
Dickey 11100	11 11 10	0111111101—16
Nichols 00011	01 00 10	0010101110— 9—40

Boston Gun Club Team.

Kirkwood 10010	00 01 00	0111001011— 9
Johnson 01110	11 11 01	1101111011—16
Field 10110	10 11 10	1101111011—15—40

Exeter Club Team.

Taylor 00100	00 10 00	1111111111—12
Cooper 01001	11 00 11	0110111101—13
Jenkins 11110	01 10 01	1101001111—14—39

Second Worcester Team.

Smith 01000	00 00 11	1100001110— 8
Sampson 11111	10 10 00	1011111011—15
Houghton 10110	00 10 10	1101101111—13—36

Wakefield Sportsman Team.

Dalton 11011	10 10 10	1100111111—14
Miles 01110	10 10 00	1101001101—12
Goodman 09000	00 00 00	1010101011— 6—32

Ties for first were only decided on the fifth tie, when the Worcester first team took first money, Boston Gun Club and Massachusets Rifle divided second, the Exeter taking the third. A large number of visitors were present during this match, and exciting the greatest interest.

Seventh event, 5 single birds.

Eager	11111—5	Chambers	01001—2
Schaefer	00011—2	Emerson	11111—5
Sampson	11001—3	Nichols	01111—4
Jenkins	11011—4	White	11110—4
Sawyer	10111—4	W S Perry	01110—3
R Perry	01110—3	Curtis	01101—3
Evans	01111—4	Cooper	01111—4
Hart	11110—4	De Rochemont	11111—5
Field	11010—3	Decker	11011—4
Steele	00001—1	Cutting	11000—2
Johnson	11111—5	Gerrish	11001—3

Eager, Johnson and Emerson first, Decker second, Sampson and Field third, Chambers, Cutting and Schaefer fourth.

Eighth event, 5 birds.

Jenkins	11101—4	Sawyer	10111—4
Hart	00111—3	Evans	01111—4
Sampson	11011—4	Field	10111—4
Cooper	11101—4	Emerson	01100—2
Decker	11101—4	Chambers	01100—2
Nichols	11000—2		

Decker and Evans first, Hart second, Nichols and Emerson third.

Ninth event, 5 birds.

Sampson	11111—5	Nichols	11000—2
Emerson	11101—4	Evans	11111—5
Hart	01110—3	Decker	11111—5
Cooper	11000—2	Sawyer	10110—3
Jenkins	01111—4	Field	00010—1

Sampson and Decker first, Emerson and Jenkins second, Hart and Sawyer third,

During the progress of the latter matches a large number of miss and out matches were shot at double birds from five traps; these events concluded a splendid day's sport, the evidences being that the next shoot on March 19 will, should weather indications be favorable, one of the largest events yet held by this club.

UNION GUN CLUB.—The first annual meeting of the Union Gun Club, of Pawtucket and Central Falls, was held Tuesday evening, March 4, and it was shown by the report of the Executive Committee that the club was in a good and prosperous condition. They have recently moved to new grounds, which are easy of access, being situated about half way between Pawtucket and Providence, and within 400yds. of the line of horse cars running between the two places. The opening shoot of the season was held on Feb. 22, and was a very enjoyable day, members from the Narragansett Gun Club, of Providence, and Watchemoket Gun Club, of East Providence, being present and taking an active part with us. We shall shoot this season from five screened traps, placed five yards apart, and Friday of each week will be our regular field day. We are always pleased to see members of other gun clubs, or those interested in shooting, at our grounds.

The following is the list of officers elected for the ensuing year: President, Charles B. Payne; Treasurer, C. Fred Crawford; Assistant Treasurer, Thomas H. Eaton; Secretary, Samuel F. Dexter; Executive Committee, John Ramsbottom, W. F. Salisbury, C. M. Carpenter.—SAMUEL F. DEXTER, Secretary.

MAPLE GROVE GUN CLUB.—Lancaster, Pa., March 4.—The sportsmen of Lancaster have organized the Maple Grove Gun Club. The officers are: President, Herbert H. Anderson; Treasurer, Charles Francisens; Secretary, John Snyder.

KNOXVILLE GUN CLUB.—The officers of the Knoxville, Tenn., Gun Club for 1884 are: President, M. G. McLang; Vice-President, S. B. Dow; Secretary and Treasurer, Chas. C. Hebbard.

WELLAND, Toronto, March 6.—To-day Capt. Ritter shot against Anderson and Seigelhurst for $20 a side, the Captain to break as many balls out of 30 as the others did out of 50—that is, 25 each. The Captain won, breaking his 30 straight. Anderson and Seigelhurst also broke 30 out of 50. A match was made to-night between Capt. Ritter and George Rogers, the noted shot from St. Catharines. The terms are two matches, one at 21 pigeons each, and the other at 50 glass balls each, for $50 a side, on Friday, 14th, to be shot here.

Yachting.

FIXTURES.

May 24.—Oswego Y. C., Opening Cruise.
May 24.—Boston Y. C., Opening Cruise.
May 30.—Knickerbocker Y. C., Spring Matches.
May 30—Atlantic Y. C., Opening Cruise.
May 31.—Boston Y.C., First Match, Connor and Commodore's cups.
June 9—Portland Y. C., Challenge Cup.
June 10.—Atlantic Y. C., Annual Match.
June 12.—New York Y. C., Annual Matches.
June 14.—Hull Y. C., Club Meet.
June 14—Seawanhaka Corinthian Y. C., Annual Matches
June 16.—East River Y. C., Annual Matches.
June 28.—Boston Y. C., Ladies' Day.
July 9.—Beverly Y. C., Marblehead, First Championship.
July 12.—Hull Y. C., Club Meet.
July 12.—Boston Y. C., Second Club Match.
July 26.—Beverly Y. C., Nahaut, Second Championship.
Aug. 9.—Hull Y. C., Club Meet.
Aug. 9.—Boston Y. C., Open Matches, all clubs.
Aug. 16.—Beverly Y. C., Swampscott, Third Championship.
Aug. 23.—Beverly Y. C., Marblehead, Open Matches.
Aug. 23.—Boston Y. C., Third Club Match.
Sept. 6.—Beverly Y. C., Marblehead, Special Matches.
Sept. 13.—Hull Y. C., Club Meet.
Sept. 13.—Boston Y. C., Second Ladies' Day.

ET TU, BRUTE!

WE announce with pleasure that Mr. Lawton's sloop Gleam is to be improved by the addition of 1,500lbs. lead on the keel, which will no doubt make the Gleam an abler craft than she now is in lumpy water. This is like a stab at the sloop in the back. The jig is nigh up when depth, keels and outside lead invade the classic regions of Bay Ridge, the last spot on the globe where the patriots have collected to resist the onslaughts of common sense by a frantic waving of the flag, drawing the while upon Danes and Swedes for their weapons in battle. And now even Bay Ridge gives lively signs of regeneration. Outside lead is the first step, the rest follows as a natural sequence. When the truly good and great patriot can so far yaw from all that is holy in the hoary traditions of American yachting as to plaster chunks of lead on the keel "allee samee cuttee," the remainder is only a question of time. Probably Gleam with her outside lead will be found rather hard in a sea, and demand an unwieldly rig. The boat which follows her will be given "just a little" less beam and "just a little" more depth, by which ye sloop of old slowly evolves herself into the cutter now capturing the public's attention.

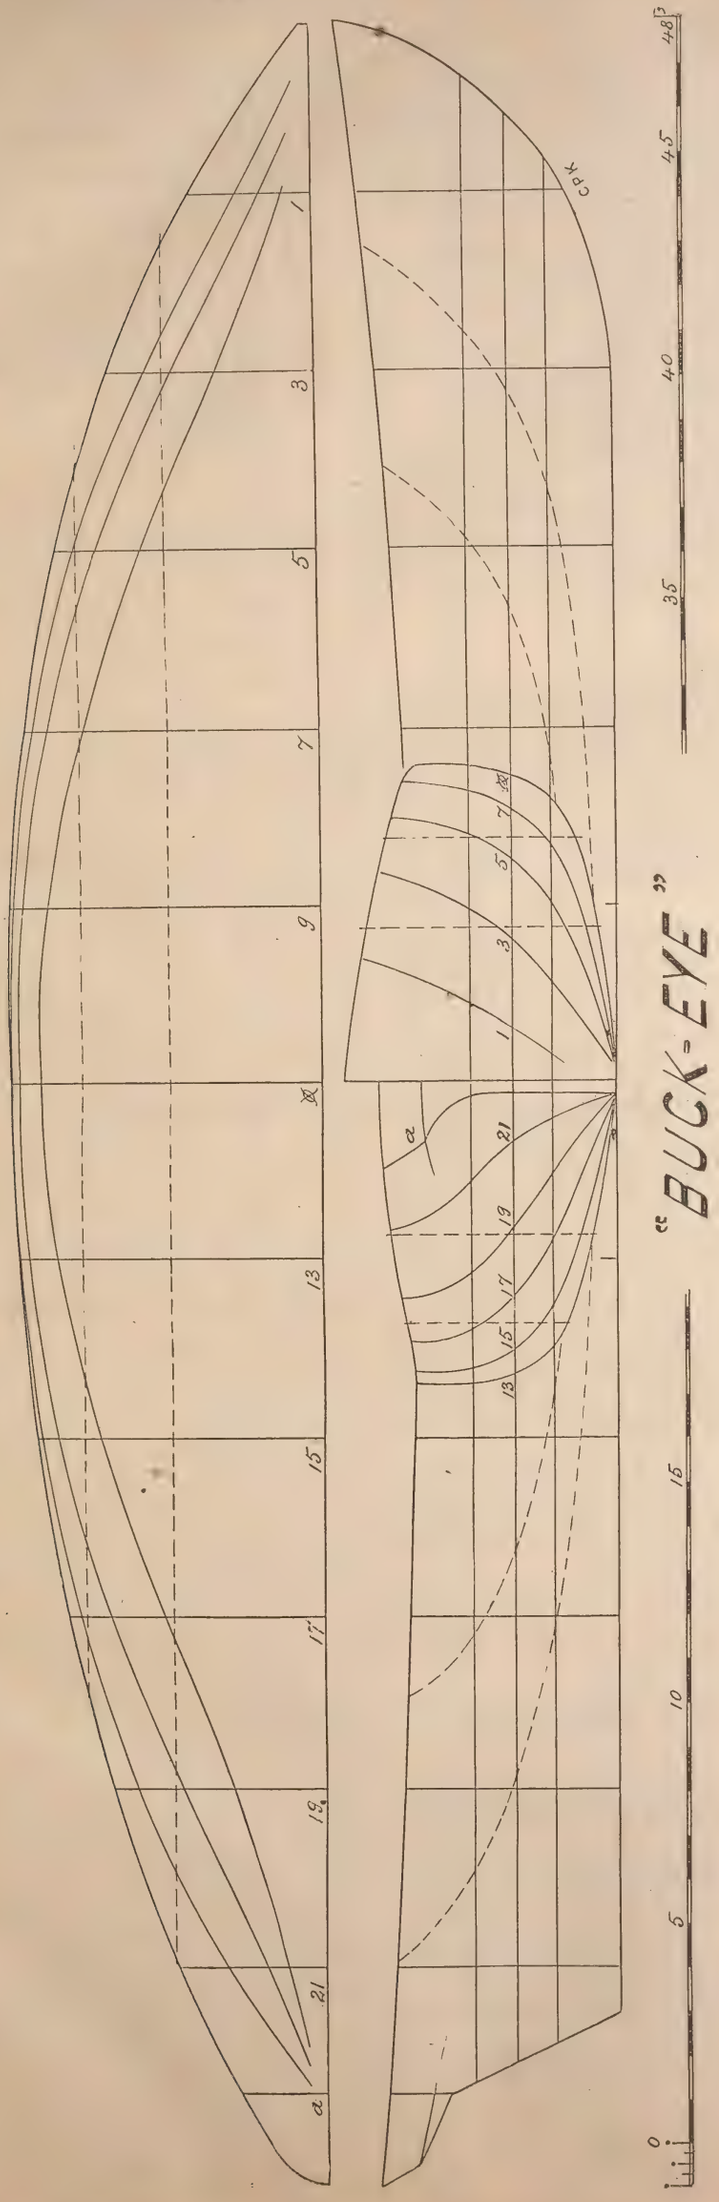
So long! Gleam, old-time trap. All hail! Gleam regenerate, one more penitent gathered into the fold. There is the difference between the naval architect and the good patriot. The former throws over the ancient, and with the true American spirit of progression accepts the new at a bound. The latter, good soul, fights into the last ditch, but bows to the inevitable, just so he can delude himself fondly with the belief that he is inventing for himself and not swallowing bitter doses emanating from base, bad "foreign" sources. So the Gleam is to "lug" a chunk of outside lead. Whither are we drifting?

HINTS TO LOCAL COMMITTEES.

IF regatta committees of the various local clubs existing in ports frequented by yachts on their summer cruise would so arrange dates for open matches it would further a systematic making of "the rounds," which would contribute immensely to the interest and ends of yacht racing in enabling records of broad meaning to be made. Cruising to the Eastward up the Sound and along the eastern coast as far as Mount Desert is becoming quite general during the summer months, especially in July, August and September. But it is still done in a desultory manner. Now, if committees of clubs from Larchmont to Portland would arrange a series of fixtures for public matches open to all comers, offering good cash purses, the cruisers would quickly learn to reduce their movements to some system, so they could put in an appearance from port to port in time to take in the races mentioned, and thereby add to the importance of all contests and the meaning of their records. It would lift racing from local to national dignity, which is what we now most need. Thus the near-by ports should fix upon early dates in July, the Eastern coast upon August and early September, and the Sound and New York ports again for the latter part of September and October. In this way a yacht, after starting in the local events, could weigh for the rounds along the coast in midsummer on the passage east, and likewise enter for the fall races during the passage home again, winding up the season with some October matches in New York waters. We commend such a scheme to the New Haven, Newport, New Bedford clubs, the various organizations in and about Boston, Salem, Newburyport, Portland, etc. A little correspondence among the secretaries of the clubs would settle upon suitable dates.

ALL IN DUE TIME.

Editor Forest and Stream:



I have been a reader of the yachting columns of your paper for a long time, and fully appreciate your efforts in disseminating ideas in the direction of increased draft and seaworthiness in our yachts.

Enough has been said on that subject to convince any one who desires or is willing to be convinced, and any further arguments will be both useless and superfluous. There will be enough cutters afloat here during the coming season to enable them to speak for themselves, and if their actual performance does not sustain their claims, arguments will be of no avail. I would suggest that you give us the designs of other types as well, of which we certainly have a large and interesting variety on this side of the Atlantic. Why not give the lines of some of the Eastern yachts, some of which greatly resemble the Daisy? Also those of some of our pilot boats, which have a reputation for speed and staunchness. Such a series, together with reports of the performance of the craft shown, would be most useful in affording the general information as to the different theories and practice in construction on which a thinking yachtsman could base a valuable opinion, and without which any statement of preference is not worthy consideration.

I therefore submit the above suggestions in a desire for wider information on yachting subjects generally. H.

[We cannot do more than possible. We have illustrated and described keel sloops of Boston, centerboard sloops, compromises, beamy cutters and narrow cutters, besides sharpies, canoes, buck-eyes, steam launches and engines, yawl rigs and cutter rigs of all kinds. We have in preparation some schooners, the Petrel as an example of a very fast yacht, a modern Boston sloop, iron work of schooners and much other practical information. It is our claim that we have published a greater number and variety of designs than all other periodicals. But everything must wait its turn. More than that cannot be expected. We can fairly say that FOREST AND STREAM has done more to further precise information and instruction in the past years than all its contemporaries put together. The field is a very large one, and the future lies before us to cover what has not yet been reached. Our object is to supply the most pressing, practical and available material within the imposed limits of commercial success, which no periodical can afford to disregard. We have naturally neglected dead issues, and for that reason have given the old-fashioned light displacement centerboards little attention. There is no object in giving publicity to boats of a style soon to become obsolete, nor to practices and customs which we condemn as fraught with harm to the best interests of the sport. We must have time to fill the whole bill. Having received several letters similar to the above, we hope this will explain the policy pursued. It is easy to ask for this or that design, but a much more difficult matter to supply the want. Most yachtsmen and yacht builders cannot furnish accurate particulars, and many are still selfish enough to assert proprietary rights for fear of giving away for the benefit of others what they deem a good thing. Considering the difficulties to be contended with, the public is to be congratulated upon having more pertinent material offered through FOREST AND STREAM than through all other sources.]

ATLANTIC Y. C.—Annual match fixed for June 10. Officers for the year: Commodore, H. H. Hogins, schooner Agnes; Vice-Commodore, George B. Moffat, cutter Enterprise; Rear Commodore, H. C. Wintringham, sloop Nomad; Recording Secretary, F. C. Swan; Corresponding Secretary, J. L. Marcellus; Treasurrr, Richard C. Field; Measurer, J. J. Pierrepont; Regatta Committee—George D. Mackay, C. T. Pierce and George W. Chauncey. The club has 204 members and 103 boats, probably a larger proportion of boats to members than any other, as some of the yachts are owned by several persons. There are 16 schooners, 65 sloops, 12 cats and 8 steamers. The club does not owe a dollar of debt, and has a bright future, possessing the best inducements in its harbor and accessible club grounds. The prosperity of the club is the direct result of pursuing a well defined policy. If the mean length rule could only be modified so as not to exclude yachts with the long overhangs which taste and practical convenience demand in boats of modern style, accessions to the fleet would take a further bound ahead.

"THE BUCKEYE."

TO supply information to many inquirers the building lines of a Chesapeake buckeye are produced herewith. The plans in question are from an original model of the Cynthia, a boat famous as abler and faster than the general run of the family. She represents the latest improvements, and it is not difficult to find good reason for her comparative success in the extra depth of one foot given her beyond the custom, the Cynthia drawing 2½ft. or the depth of 5. She is distinguished likewise by more deadrise, an easier turn to the bilge, and rather longer and finer entrance. She is another illustration of the fact that boats "grown" to a certain locality to meet certain ends are after all only in the first stages of development reviewed from a purely critical standpoint, making no allowances for the special limited work the boat is intended to cover, nor for the restrictions due to the lack of material, money or skill under which she is brought forth. For the moment the original buckeye took on a form one step nearer to the regular yacht, as in the case of the Cynthia, a marked improvement in performance resulted; and it is reasonable to suppose that still further approximations to the standards observed in yacht modeling would contribute, step by step, to a corresponding development of qualities for the better until eventually the pristine buckeye finds herself transformed into a veritable yacht, not deviating radically from a yacht in any respect. There is then good ground why any one seeking the qualities of a yacht can save himself trouble and certain disappointment in declining to be driven back to primordials of any kind. The various stages of experiment and the gradual evolution from the extemporized accidents which have "grown" to certain localities, have already all been gone through extensively by others whose experiences and labors have led up to the modern yacht as the climax to the evolution. Going back to early forms for a fresh start involves only a tedious and profitless repetition of what the world has already acquired, and it is much sounder policy to take the initial from the latest development and attempt to improve upon that.

But there are cases in which a return to first efforts is fully justified when a yacht is not wanted, but a contrivance to fulfil in the readiest and cheapest way that particular duty to which the existence of the "grown" or indigent boats owe their origin, though even then the structural and mechanical attributes will generally admit of considerable amelioration through the application of funds and greater skill than were at the command of the originators of the type. Thus we find that where the peculiarities of the buckeye are sought to be preserved, their build has undergone great change nevertheless. The Cynthia and her sisters are no longer the clumsy dugouts of yore, but are built with a frame and regularly planked. The crude creation hewn out of a log has been replaced by a more pretentious construction, both in regard to perfection and refinement of form as well as in methods of manufacture.

This stage of the evolution is fittingly represented by the buckeye. Sportsmen and others on the lookout for a boat which will carry them and a load at good speed on the conditions of cheap first cost, light draft and small rig with fair behavior in troubled waters, will find in the plans produced this week one more excellent addition to the collection of useful substitutes for full-fledged yachts. As the sharpie displaced the dugout on Long Island Sound with the scarcity of large logs and the advent of the sawmill, so has the framed buckeye come to the fore in Chesapeake Bay and Southern waters as the substitute for the improvised canoe.

That she is a swift boat, gauged by a rational comparison of size and not by the empyrical length standard set up out of hand by yachting cliques without reason or considerations of justice, few need to be told. With a long body, easy ends and fore and aft sections, with deadrise and slow bilge and a fair allotment of ballast to the bulk, boats like the Cynthia ought to be capable of excellent behavior and speedy on all points, falling short only in turning to windward in lumpy water. This the sportsmen may be willing enough to forego for the sake of the economical inducements and light draft held forth. For his purposes the buckeye can certainly be favorably commended. He will find it quite possible to improve upon her present equipment, and thus exact a higher degree of efficiency by attention to details of ballasting and rig.

The Cynthia is 49ft. on deck between rabbets, the plans being to outside of moulds only. Her beam is 14ft. and draft 3½ft., with keel in ordinary trim, or about 2½ if fitted with board. Owing to her ballast she has good weight for working, some ability in a sea, and shows well in climbing to windward, where lighter boats fail. She has a round stern, which is locally a matter of pride and style obtained at an extra cost of about $300. The buckeye is built in all the ports along the Chesapeake, and a fifty foot boat, hull and spars, is said to cost about $1,000, iron work, sails, gear and joinerwork in cabin being extra, which $500 may cover. The usual rig is similar to the sharpie, and was illustrated in this paper for Feb. 14. The schooner rig is, however, coming into vogue as more efficient.

SOME GENERAL REMARKS.

REFERRING to Mr. Franklyn Bassford's letter published last week, these remarks are made in reply and explanation:

Weight in itself without consideration of form is not productive of resistance, but form without regard to weight certainly is. Hence great weight on a good form of sufficiently narrow beam may be driven as economically as less weight in a broader form. Though more water is moved, it is moved to a less distance, hence at a less speed and expenditure of power. Proof to be found in the fact that with like sail area, Bedouin drives 106 tons practically at the same speed the Gracie drives her 64 tons. We referred to beam in proportion to loadline, as fantail overhangs cannot be included in the boat proper from a naval architect's standpoint any more than a cutwater reaching half way out on the bowsprit. A look at Lloyd's Register will show a vast majority of cutters under 4½ beams and a mere handful of 5 beams and over. For the rest it seems to be only a dispute as to what can be called a sloop and what a cutter. No hard and fast line can be drawn, for one type gradually merges into the other, and if it is any consolation to call a sloop so modified as to possess in a greater or less degree the principles of a cutter by the term sloop, no one will seriously object. They may be called frigates with a fore and aft rig, or steamers without an engine, for all the difference the name will make. Just so our yachts are built with enough depth and weight and shipshape equipment to earn respect from seamen and professional people instead of being looked upon as childish toys or silly machines. A centerboard will draw less water than a keel, though the difference in deep boats is reduced often to a nominal amount, and it remains for every one to determine for his own purpose whether the advantages of either overbalance the disadvantages. The cost of a yacht is regulated by the amount of material and labor used in construction and the completeness of equipment, and not by the empty name her type goes by. All this may be more in a sloop or in a cutter, according to their individual shape and outfit. With the exception of excess in ballast, there is nothing in a cutter which, quality for quality, cannot be as cheap and even cheaper than in the sloop. It is certain, however, that a cheap and nasty job will cost less than a good piece of work, regardless of type, in the first place, though, taking depreciation into account, the costly job will often be found the cheaper in the long run. Mentioning prices of yachts out of hand is no more a fair comparison than citing a Chatham street suit of hand-me-downs for $10 against a $50 suit from a reputable tailor. The notion that a boat and a boat ought to cost alike simply because they are two boats ought to be overcome by this time. A tin watch and a gold watch are both watches, but there is a difference in price. The construction and outfit of the Bedouin and the Gracie differ in just the same manner, and long after the Gracie is broken up for firewood the Bedouin will have fair market value. The modern beamy Boston sloops are not only as expensive but more expensive to build than cutters, for the simple reason that there is more of them on the length in the way of material, more rig and equal or more displacement and draft. The Gracie is an old-fashioned light draft. Such yachts are no longer built. Dr. Barron's new sloop of 52ft. loadline has more than the actual depth of the Gracie on 70ft., and within a few inches the same draft. We are well aware that under length rules very narrow beam cutters may not come into vogue, but the signs of the times all point to moderate beam at least, coupled with the depth, draft, low weights and equipment of the cutter. All this may be only old experience. It may all have been tried long ago. In fact, the ancient Phœnicians knew all about cutters and outside lead long before the English developed the modern yacht. There is nothing new under the sun anyway. But the fact remains that in spite of previous experience we drifted off at a tangent here in America into the universal construction of flat, shoal, light displacement traps and declined to listen to anything else until the "cutter agitation" again opened the public's eyes to the possibilities in directions for a long period refused the slighest recognition. That period is now closing. There will be no more schooners built like the Grayling and no more sloops like the Fannie or Gracie. How far we will proceed in the opposite path, how nearly we will approximate the extreme type of cutter is a question no newspaper controversy can settle. It can safely be left to future experience. Forest and Stream has labored for a full understanding of both sides and equal recognition to various systems, so that intelligent selection would result. It must be readily understood by every one that as long as "cutter principles" could not obtain a hearing in this country, as long as everything in the way of change or improvement was damned without trial or evidence, yacht designing was nothing but groping in the dark, a matter of stumbling on the right thing in place of intelligently appreciating the problems to be worked up to as nearly as limiting conditions would allow. No better

proof of the utter absence of trustworthy knowledge among the classes accepting the responsibility of modeling our yachts can be asked than the capsizing of the Grayling, a schooner which had been proclaimed absolutely uncapsizable while on the stocks because the so-called "practical" eye was mislead by her beam into a false assumption, the few who foresaw the probability of the disaster being laughed to scorn for their temerity in proclaiming the likelihood of that which subsequently happened. We have again fairly started on the right path with the practice of more depth and weight and better rigs, and for that only FOREST AND STREAM, with its few coadjutors, must be thanked. Our course has been opposed at every step by every conceivable agency, but in spite of prejudice, false witnesses, and malice, the cutters steadily increase in numbers, and the whole of American yacht building has entered upon a revolution, circling about the cutter in a spiral gradually piloting up to the ultimate center of perfection. And in the knowledge that no agency has contributed to this great change more than our pen lies our reward and satisfaction, be the upshot of it all "improved so-called sloops," "American cutters," or exact copies of the foreign craft under our flag. We care not which, so the trap has been forever ousted and the dawdler transformed into a veritable amateur shellback, with irresistible salt water longings. The question of type has been so fully discussed in this journal, that we refer to our files rather than give more space to a reopening of generalities not specific enough to lead to a point. It is certain that the ball of innovation has been started rolling. It is certain that it has not yet stopped rolling, for successive yachts represent fresh departures from their predecessors. The ball may now be allowed to roll out its course, then we will know upon what it has brought up. We are entitled to thanks for having inaugurated this new era in the overthrow of warped and narrow conceptions which monopolized attention before our advent upon the scene. To that extent we have earned the favorable recognition even of those who still resist the inevitable evolution from the makeshift of American yachting in its infant days to the regular vessels of yachting, ripened into the dignified occupation of men.

NEW ENGLAND YACHT RACING ASSOCIATION.

BY-LAWS.

ADOPTED at meeting of delegates from New England yacht clubs, held at Parker House, Boston, Feb. 20, 1884. Compiled by W. Lloyd Jeffries, Beverly Y. C.; C. A. Perkins, Hull Y. C.; L. M. Clark, Dorchester Y. C.; John Bryant, Eastern Y. C.; Parkman Dexter, Dorchester Y. C.; C. F. Loring, Boston Y. C., *ex-officio*, committee.

ARTICLE I.

NAME.—The name of this organization shall be The New England Yacht Racing Association.

ARTICLE II.

OBJECTS.—The objects of the Association shall be: To encourage yacht building and yacht racing; to establish and enforce uniform rules for the government of all races in which the yachts of two or more clubs compete.

ARTICLE III.

MEMBERSHIP.—The following yacht clubs may become members of this Association by accepting the by-laws: Beverly, Boston, Bunker Hill, Dorchester, Eastern, Hull, Jeffries, Lynn, Portland, Quincy, Salem Bay, South Boston, West Lynn and Yale.

Any other yacht club of New England in good standing, having fifty members, or twenty-five yachts measuring more than ten feet in length on the water line, shall be eligible to membership. Applications for membership must be made in writing to the secretary of the Association, must be signed by the commodore or secretary of the club applying for membership, and must contain a correct list of the members and yachts of the club. The executive committee shall act upon said application, and shall admit all clubs eligible under this article. The decision of the committee shall be final.

ARTICLE IV.

REPRESENTATION.—Each club shall be represented in the Association by one delegate.

ARTICLE V.

OFFICERS.—The officers of the Association shall be as follows: President, vice-president, secretary (who shall also be treasurer), and an executive committee consisting of five members, of which the president and vice-president shall be *ex-officiis*. These officers shall be elected by ballot at each annual meeting, and shall hold office for one year or until their successors have been duly elected. Vacancies may be filled at any regular or special meeting. A majority of the votes of the members present shall be necessary to elect.

ARTICLE VI.

DUTIES OF OFFICERS.—*President.* The president shall preside at all meetings and enforce all regulations of the Association. He may call a special meeting at his pleasure, and shall so do at the written request of any club of the Association.

Vice-President. The vice-president shall assist the president in the discharge of his duties, and in his absence officiate in his stead.

Secretary. The secretary shall keep a true record of the proceedings of all the meetings of the Association in a book provided for that purpose; shall keep a correct roll of all the clubs and delegates; shall notify each club of its election to membership; and shall notify each delegate of every meeting and of the purpose for which it is called.

Treasurer. The treasurer shall collect all money due the Association and pay all bills contracted by it, keeping a correct account of the same in a book provided for that purpose. He shall make a report at each annual meeting of all the receipts and expenditures, and of the amount of money remaining in his hand.

Executive Committee. The executive committee shall act as a membership committee, shall establish and enforce penalties for the infringement of the racing rules of the Association, and shall settle any dispute arising out of the construction of racing rules which shall be referred to the Association.

ARTICLE VII.

MEETINGS.—There shall be an annual meeting on the fourth Wednesday in April of each year, at which the reports of the secretary and treasurer shall be read, and officers for the ensuing year shall be elected. Special meetings may be called by the president. Notice of each meeting shall be issued by the secretary at least ten days before the date thereof. Representatives from five clubs shall constitute a quorum. Voting by proxy shall not be allowed, but in case of the absence of any delegate, his place at that meeting may be filled in such manner as his club may have provided.

ARTICLE VIII.

ASSESSMENTS.—Funds for defraying the current expenses of the Association shall be raised by an annual assessment on each club of ten dollars, which shall be due and payable in advance, and the financial year shall begin at the date of the annual meeting. No other assessment shall be levied except by a two-thirds vote of all the delegates present at a meeting called for that purpose.

ARTICLE IX.

RESIGNATIONS AND EXPULSIONS.—The membership of any club in the Association shall be forfeited by voluntary withdrawal, or by a two-thirds vote of all the clubs of the Association at a meeting specially called, at which said club shall have an opportunity of being heard in its own defense.

ARTICLE X.

AMENDMENTS.—These by-laws may be amended by a two-thirds vote at any meeting of the Association, provided, however, that the notice of such meeting shall have contained the proposed amendment in full.

First meeting at Parker House, Boston, April 23, at 7 P. M.
P. O. Box 1381, Boston. PELEG ABORN, Secretary.

THE BUGBEAR OF DRAFT.

Editor Forest and Stream:

Ever since the cutter became an element in yachting, a great deal has been said and written by sloop men about the cutter's great draft in relation to our shoal waters and harbors. Here is a list of the principal waters and harbors used by the yachts of this port. We find that with one or two exceptions, wherever vessels of the Gracie's draft of water could be accommodated there would be water enough for the largest cutter.

Horse Shoe, Sandy Hook Bay, 16ft. to 8fms. The channels from the ocean contain from 14ft. upward, Gravesend Bay, 12ft. close up to the beach. Upper Quarantine and Bay Ridge anchorages 4fms. and 6fms. respectively. Kill von Kull 3½fms., lower Hudson 4fms. From Governor's Island to Whitestone, the East River is narrow, but deep. Whitestone anchorage 3½fms. Along the north shore of Long Island we find the following anchorages; Cow Bay, 12ft. to 5fms.; Sand's Point, 12ft to 16ft.; Glen Cove dock, 3½fms.; Oyster Bay, 10ft. to 5fms.; Cold Spring, 15ft.; Lloyd's Harbor, 10ft.; Northport Bay, 10ft. to 5fms. Port Jefferson harbor can only be entered by large vessels during certain conditions of wind and tide. A yacht that is being repaired at that port now draws 11ft. Orient harbor, 15ft.; Greenport, 3½fms. close to dock. Through Shelter Island Sound and the greater parts of Little and Great Peconic Bays, a vessel drawing 15ft. could be carried. Sag Harbor, 10ft.; Napeague Harbor, 12ft. On the lower shore of the Sound comes first in order City Island Roads, 10ft. to 6fms.; Larchmont Harbor or Delancey's Cove, 6ft. to 11ft.; Captain's Harbor, 3½fms.; abreast of Morton House, Greenwich, 9ft.; Stamford Harbor, not much frequented, 9ft.; Black Rock, 10, 12 and 15ft.; Charles Island Harbor, east of the island of the same name, recently purchased by the American Y. C., 10 to 16ft.; behind the breakwater in New Haven Harbor, we find 3½fms.; Morris' Cove, 10 to 14ft.; 13ft. may be carried up to the city through a very narrow channel; the rest of the upper harbor falls almost dry at low water. Thimble Island's harbor, 15ft.; Connecticut River bar, 7½ft. This would shut out our big cutters and sloops at low water. Inside the bar there is plenty of water as far as the chart gives soundings opposite Lynn Ferry. New London Harbor, 10ft. to 5fms.; Noank 13ft.; Mystic Bridge, 11ft.; West Harbor, Fisher's Island, 10 and 14ft.; Stonington, 10 and 12ft.; East of the Race we have Block Island Breakwater, behind which we find 8 to 16ft.; Newport, 10ft. to 3½fms.; Wickford, 14ft. Providence is approached by a very narrow dredged channel 20ft. deep; the rest of the harbor falls dry. Bristol, 16ft.; Fall River, 13 and 15ft.; New Bedford, 15ft. to 8fms.; Upper Harbor, 9 to 14ft.; Cutty Hunk, 14ft. The other harbors in Buzzard's Bay are little used by New York yachtsmen, but with the exception of those situated in the extreme northern portion the chart shows anchorage in 10ft.

In Vineyard Sound, Tarpaulin Cove 15ft., Wood's Hole 14ft., Vineyard Haven 8fms., Edgartown 16ft. and over, Hyannis Port 13ft. to 3fms., Stage Harbor, Chatham, 18ft., but there is only 3ft. on the bar at the harbor's mouth; Nantucket Harbor 9ft. to 15ft., but the bar shows only 5ft., and as the tide only rises 2ft. or so in this locality vessels of comparatively little draft are shut out of the last two harbors mentioned. These figures are all taken from the chart and indicate the depth at mean low water spring tides. HAND LEAD.

[The fear of draft is in practical yachting life a bugbear and nothing else. The same kind of aversion once existed in Eastern waters, but now nearly all yachts built East are keel boats of as great and even greater draft than regular cutters. New Yorkers are fast overcoming their aversion to draft. Those owning keel yachts invariably acknowledge that their draft does not bother them in the least. It is, of course, possible that by deliberate selection a spot here and there can be found too shoal for a deep draft. The same can be said of every coast in the world. We are far better off for depth of water than our English cousins, many of the English harbors being artificial and drying out at low water. Our harbors and channels are also easier to navigate, and our system of buoyage and lighting superior and simpler than similar provisions abroad. There are isolated instances where a flat trap will make shelter in some small cove to which a deep draft could not follow. But such cases are so few and far between that they cannot be taken into consideration as having any weight upon the choice of proper design. We deem the question of draft clap-trap pure and simple. "Our shoal waters" are much of a myth, and no longer influence any sensible people who know what they want a yacht for.]

THE NEW HERA.

Editor Forest and Stream:

You stated in last week's paper that the new Hera will displace 14 tons on 36ft. loadline against the 16½ of Madge on 38ft. I think the Hera will run nearer 16 tons than 14, and in proportion to length will displace more than any cutter, fully justifying your position that the new length sloops will cost more than cutters, and be more expensive to keep in commission and more difficult to manage. We have not reached the limit yet, and I think we will see Heras with 18 tons displacement, and 36ft. hoist to mainsail as the natural consequence to length measurement. My choice would be about 12 tons displacement with say three and a half beams, and about 25ft. hoist to loadline of 36ft., as a good average for all purposes, but such a boat would start with a disadvantange for racing as you have often explained, so there seems nothing to do but to build the largest boats in the hope that the trouble will correct itself by bringing into prominence the evils of the length rule. It seems a pity to me that a better rule cannot be adopted at once without, so to speak, going through an experimental purgatory to cleanse the cobwebs from our under standing. SEMI-CUTTER.

FRIGHTFUL ANARCHY.—Our cousins abroad are at their wits' ends on the measurement question, and we are not much better off here in America. One thing the English are fast realizing. The Y. R. A. rule must go. It is killing yacht racing not because of the cost of the modern narrow beams as often assumed, but because it outclasses all other styles in handicapping them so heavily with a fictitious tonnage. Remove this unjust discrimination and the beamy yacht will come to the fore if she proves the equal of narrow deep heelers in speed. If she cannot match the narrow flyers of the latest proportions on a fair rule, no rule can alter the present state of affairs unless in the nature of a penalty upon the narrow beams in turn, and that no fair rule should seek to accomplish, for no fair rule should dictate how we are to model and how not. That handicaps upon fast boats will never become popular stands to reason, because diametrically opposed to the very nature and objects of allowing time. Last week's *Land and Water* says: "As handicapping is equivalent (or, at any rate, is intended so to be) to bringing the merest old tub and the smartest vessel to an equality, it seems as if no good results could be derived from this curious style of racing, and as yacht racing was originated and is still supported with a view to the improvement of naval architecture, it seems illogical and even ridiculous to encourage it. Were handicaps to become general, there would be no inducement to build fast vessels, and it is by no means improbable that the designing and construction of yachts for racing purposes would altogether cease. Fortunately, however, if we may judge from bygone experience, this kind of racing will never become common, and it is not likely that it will influence genuine sport one way or the other."

SUCCESSFUL SCHOONER.—Last winter a gentleman living on the Chesapeake built a schooner on the lines of the Penzance lugger, illustrated in Dixon Kemp's popular book on "Yacht and Boat Sailing," but gave her one foot more depth. She has proven a success, being quite fast, a good, comfortable and wentherly sea boat, with large accommodations. Loadline, 36ft.; beam on same, 10ft.; freeboard, 3ft.; draft, 4ft. 9in. Inside iron ballast. Rigged as a pole schooner, with single jib and large yard lug foresail for light winds. Hoist of mainsail, 26ft.; bowsprit outboard, 10ft. Base of three lower sails, 55ft. Headroom in cabin, 6ft. Floor, 3½ft., and sofas 32in. wide. For general cruising the yacht has shown herself well adapted. She is already in commission on Chesapeake Bay. We will soon publish lines and details.

PORTLAND Y. C.—Has 147 members. 6 schooners, 14 sloops, 5 cats, 1 steamer, and 1 catamaran—27 in all. During the past season 118 "foreign" yachts put in to Portland harbor, of which 11 were steamers. Challenge Cup race fixed for June 9. Officers for the year: Commodore, William Senter, Jr.; Vice-Commodore, Geo. C. Owen; Fleet Captain, Edward Woodman; Secretary, George Doane Rand; Treasurer, Harry R. Virgin; Measurer, Joseph H. Dyer; Regatta Committee, Com. Wm. Senter, Jr., ex-officio, Frank L. Moseley, H. P. Larrabee, H. R. Virgin, W. H. Stevens.

THE NICE INTERNATIONAL.—The great international races at Nice, April 15, 16 and 17, promise good sport this year. The famous cutter Annasona has shifted for yawl rig, and will appear as such, the rules having been altered to allow mixed rigs to compete for same prize. The English schooner Gladys, 80x15.7x9.1, built in 1876 by Harland & Wolff, of Belfast, has been entered. The American schooner Dauntless was at Algiers Feb. 14, bound for Nice, and the Gitana, of Boston, may also appear at the start.

ANNASONA.—This cutter will, after all, sail under her regular rig at Nice, owing to late change in the rules. Her cutter spars will be sent out after her. The performance of this modern narrow beam on the passage will be full of interest. Judging by the recent cruise of the fleen down our own coast, she ought to prove a fine, able sea boat, in spite of the misgivings of the old school.

LAST NEWPORT RACES.—A gentleman writes that Captain Joe Ellsworth, who sailed the Montauk for the Goelet Cup in the matches of last August, acknowledged in person that Fortuna had the race in hand, and lost only by trying to carry unproper sail on the wind. This by way of reply to assertions of correspondents giving different explanations.

RARITAN Y. C.—*Editor Forest and Stream:* The election of officers of Raritan Y. C. resulted as follows: Commodore, N. D. White; Vice-Commodore, E. H. Hall; Secretary, F. W. Kitchel; Treasurer, F. A. Greenly; Measurer, C. F. Hall. The treasury is in a flourishing condition, and a good time is anticipated the coming season.—F. W. K.

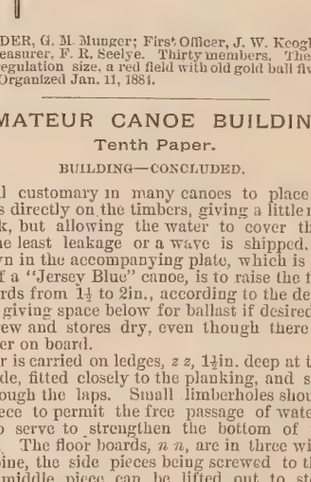
JERSEY CITY Y. C.—Officers for the year: Commodore, H. C. Roome; Vice-Commodore, F. C. Brower-Ancher; Secretary, George Hawes; Measurer, G. H. T. Doggett; Regatta Committee, Charles G. Gardner, F. E. Coles, and John Linegrove.

HUNT'S MAGAZINE.—The February number contains a very fair design for a four-beam yacht, 26ft. loadline and 6ft. 6in. beam, with 4.8 tons displacement and 4½ft. draft. Also a variety of cruises, some of which are quite interesting.

THE MIGNONETTE.—The rig illustrated last week, and the calculations are for sails unstretched as they come from the sailmaker's loft. Carmita's rig is her cruising suit. For racing she has a larger plan.

THE SEASON.—The reader's attention is directed to our advertising columns, in which bargains in tonnage are often offered, and other announcements which will save many inquiries.

THE NEW RULE ABROAD.—The London *Field* says the Royal Thames Y. C. proposes to substitute the sail area and length rule in place of Y. R. A. tonnage for trial.



DAUNTLESS.—Mr. Colt's schooner returned to Gibraltar with boat gone and bulwarks smashed. Repaired and resumed voyage to Malaga.

MERLIN.—The rig of this new cutter measures 50ft. bowsprit hounds to mainsail clew, and 45ft. deck to topmast shoulder.

PORTABLE BOAT.—Communication on this subject has been received, but no name was attached

Canoeing.

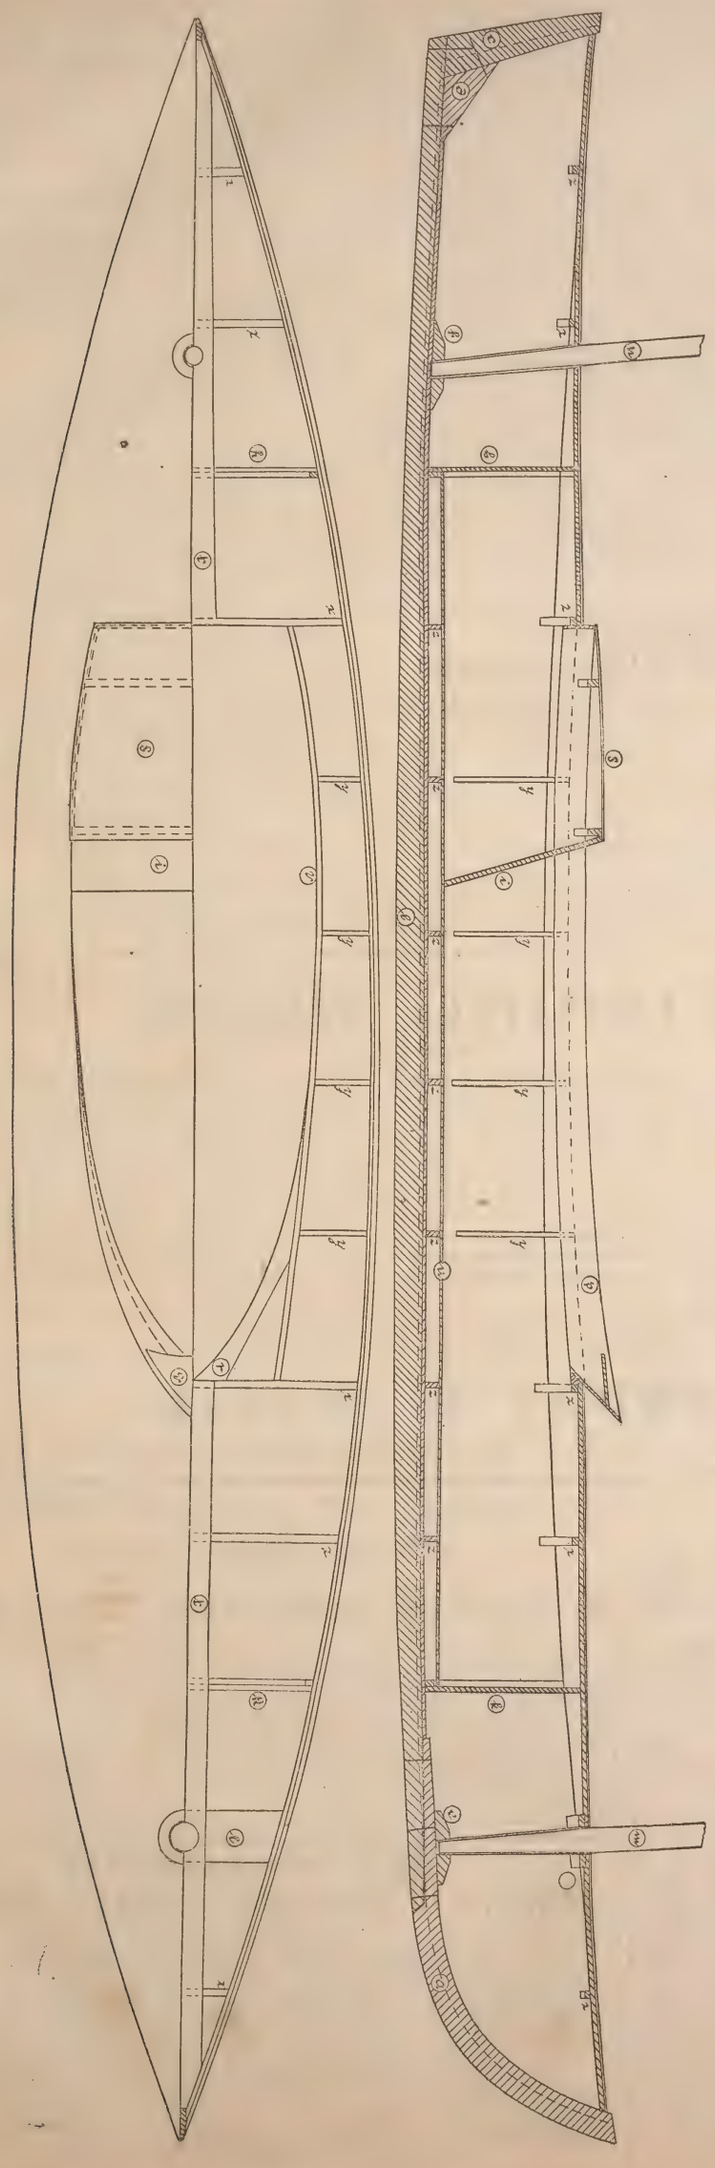
CHICAGO C. C.

COMMANDER, G. M. Munger; First Officer, J. W. Keogh; Secretary and Treasurer, F. R. Seelye. Thirty members. The club burgee is A. C. A. regulation size, a red field with old gold ball five inches in diameter. Organized Jan. 11, 1881.

AMATEUR CANOE BUILDING.

Tenth Paper.

BUILDING—CONCLUDED.



IT is still customary in many canoes to place the floor boards directly on the timbers, giving a little more space below deck, but allowing the water to cover the floor if there is the least leakage or a wave is shipped. A better plan, shown in the accompanying plate, which is a working drawing of a "Jersey Blue" canoe, is to raise the floor above the garboards from 1½ to 2in., according to the depth of the boat, thus giving space below for ballast if desired, and also keeping crew and stores dry, even though there is considerable water on board.

The floor is carried on ledges, *z z*, 1½in. deep at the middle by ⅜in. wide, fitted closely to the planking, and secured by screws through the laps. Small limberholes should be cut in each piece to permit the free passage of water. These pieces also serve to strengthen the bottom of the canoe materially. The floor boards, *n n*, are in three widths, ⅜in. thick, of pine, the side pieces being screwed to the ledges, while the middle piece can be lifted out to stow ballast below. An oval hole in the latter piece, about under the knees of the crew, holds a sponge for bailing. The deck beams—of pine, spruce or hackmatack—are marked out from a beam mould, which is made from the large drawing. The amount of crown to be given to the deck must be decided on by the builder. From 3 to 3½in. is not too much for a 30-in. boat, as the space below, for air and stowage, is much greater than with a flat deck; the boat will free herself from a wave quicker, and there is nothing to be said against it. Before putting in the deck beams the timbers must be cut off level with the gunwale, and the latter planed down until the sheer is perfectly fair from end to end, the beam mould being used at the same time as a guide by which to bevel the gunwales to suit the deck beams. The latter are spaced about as shown in the drawing, being fastened by a 2in. brass screw through gunwale and upper streak into each end. The beams will be 1in. deep and ¼in. wide, except the partner beam that supports the mainmast, which will be 4in. wide, so as to take a 2¼in. hole for the mast tube, and the beams under the butts of the deck, which will be 1¼in. wide.

Canoe decks are sometimes laid in but two pieces, with one seam only down the center, but while this makes a very handsome deck it is necessary to take off the entire half deck every time that repairs or alterations are to be made. It is often desirable to open one of the end compartments, and to do this quickly the decks are now very often laid in six or more pieces, one joint being over the forward bulkhead and one over the after one. At these points the beams are made 1¼in. wide and but ⅜in. deep, each piece of deck lapping ⅝in. on the beam. After the beams are in, ridge pieces are fitted down the center of the deck fore and aft of the well. They are from 2 to 4in. wide, according to the size of the masts, and ⅜in. thick, being halved down into the deck beams and bulkheads and nailed to them. The holes for the mast tubes are now bored, the steps of oak are fitted and securely screwed or riveted to the keel and the mast tubes put in place. These are of copper or brass, the ends soldered up so that they are perfectly watertight. The upper ends are slightly flanged over the ridge pieces, with a little lamp wick and paint under the flange to make a tight joint. Plugs are sometimes put in the bulkheads to drain off any leakage, and the holes for them should be bored now, as low down as possible. The frame work of the well consists of two fore and aft pieces of spruce, *v v*, ⅜x1½in. sprung partly to the shape of the well, the ends nailed to the deck beams and bulkhead, and also of two curved chocks, *r r*, at the forward end, completing the pointed form of the cockpit. The side decks are also supported by four knees, *y y*, on each side, sawn from oak ⅜in. thick and screwed or riveted to the planking, a brass screw 1½in. long passing through the gunwale into each, while the side pieces, *v v*, are screwed to the inner ends.

Before putting in the coaming, the decks, which will be of ¼in. mahogany or Spanish cedar, should be cut and fitted roughly to the outline of the well, the final fitting being done after the coamings are in. These should be of clear tough white oak, ¼in. thick. Their shape is taken by means of a thin staff sprung into the well, the upper and lower edges of the side pieces being marked on it. The pointed coamings now generally preferred are from 3 to 3½in. high forward, sloping to 1½in. amidships and aft, the after end being either round or square. The coamings are riveted to the side pieces and the after piece to the deck beam or bulkhead, a piece of ⅜in. mahogany, *q*, being fitted in the angle forward, to strengthen it, and also to hold cleats and belaying pins.

The other fittings, described in the following chapter, such as side flaps, footgear, tabernacle, etc., are now put in, then the boat is turned over and the outside smoothed down, using fine sandpaper and a file on the nail heads; the stem band, of 1/16in. half-round brass, is drilled and put on, the rudder braces

are fitted and riveted fast, and sometimes bilge keels, which are strips of hard oak ⅜in. square and about 4ft. long, are screwed to the bottom about over the second lap, protecting the boat in hauling up.

The outside of the boat and the inside of well has now a coat of raw linseed oil, and the inside of the compartments, the bottom, under the floor, and the deck frame, is painted with white lead and oil, sufficient black being added to make a lead color. Now, the bulkheads should be tested, to do which the boat is securely blocked up a short distance above the floor, and each bulkhead in turn filled with water, the leaks, if any, being carefully noted and marked. After the ends are tested, the water may be bailed into the middle of the boat, and the leaks there marked also. When these have been made tight, the decks may be laid, the pieces being first fitted, and then the under side of them being painted, and the edges of the gunwales, ridge pieces and bulkheads being also covered with thick paint or varnish. While this is fresh the pieces of deck are laid in place and fastened with ⅝in. No. 5 brass screws, placed 3in. apart, along the gunwales, ridge pieces, deck beams, bulkheads and side pieces of the well. In all the older canoes the screw heads were countersunk and puttied over, but it is customary now only to screw them flush with the wood, allowing the head to show. If puttied over it is difficult to remove them, and the decks will be more or less defaced in clearing out the hard putty in order to do so.

After the deck is on, enough quarter-round heading of mahogany must be got out to go around the well, and also some half-round, to cover the seam down the center of the deck. These are nailed with half-inch brass or copper nails. The decks are next oiled, the mast plates, cleats, screw-eyes, and other fittings screwed fast, the rudder, hatches, etc. completed, and all the outside of hull and inside of the well is varnished with some variety of wood filler, of which there are several in the market. This first coat is merely to fill the grain of the wood, and has no polish of its own. After it is thoroughly dry, a coat of spar composition should be given, and allowed full time to dry before using the boat.

THE LAKE GEORGE C. C.

THE third annual meeting of the Lake Geore C. C. convened at the residence of Mr. S. R. Stoddard, 22 Elm street, Glens Falls, N. Y., on the eveuing of Feb. 21, to elect officers for the ensuing year. Dr. Charles A. Neidé was re-elected captain of the club, Mr. James Knight was chosen mate, and Mr. F. F. Pruyn was elected purser, which last office covers the duties of a secretary and treasurer. The members of the club, who must be active canoeists and canoe owners, are known as skippers, this being the American title for the commander of a fore-and-aft schooner or coasting vessel. Messrs. W. F. Ranger and Charles Oblenis were elected members of the club.

Dr. Néide spoke of his desire to encourage local camps of canoeists throughout the country, as many A. C. A. members cannot attend the annual Association meetings. These local meets would do much to encourage local canoeing; and as there were some old members of the A. C. A. and many new ones, who desired to visit the birthplace of the A. C. A., Lake George, he proposed that a committee, consisting of Messrs. E. W. West James Knight and W. F. Ranger, be appointed to arrange for a local meet of canoeists, at the Canoe Islands, Lake George, to take place after that of the Newburgh-on-the-Hudson and before the A. C. A. gathering on the river St. Lawrence in August, 1884.

The above named gentlemen were appointed to draw up a call to be issued, inviting canoeists to camp upon Lorna Island, Lake George. Skipper N. H. Bishop, in the name of the owners of the Canoe Islands (Messrs. Longworth and Wulsin, of the Cincinnati C. C., and N. H. Bishop, of the L. G. C. C.) offered the free use, under sanitary conditions, of Lorna Island for the local meet.

It was understood that the above meet was for the purpose of strengthening the ties of brotherhood among cruising canoeists, and also for the encouragement of independent camping. At the late Canadian canoe meet the Lake George Canoe Club was credited with being the only party of canoeists present which did its own cooking and catering. The local meet to take place at Lake George is intended to make canoeists independent of hotels, restaurants and other inappropriate aids to successful canoeing.

It is hoped that all cruisers who gather at our "Sacred Lake" next summer will exert themselves to come as independent cruisers with means at hand to cruise and live as far as possible by their own exertions. There will be no hotel racing at the lake the coming summer under the auspices of any canoe organization. Canoeists, however, can act independently and individually in this matter, according to their own wishes after the local meet at the Canoe Islands has ended.

The committee may be addressed at Glens Falls, Warren county, N. Y. Its chairman will soon issue, through the usual organs, all information that may be needed by those who expect to aid us in putting canoe-cruising upon a substantial and independent basis. Parties who are not canoeists, but desire to join the brotherhood, are invited to come.

When not canoe owners, but owners of cruising boats, they will be received as brothers of the cruising fraternity, and will be invited to connect themselves with the meet. McGreggor, Baden, Powell, and other English canoeists, were boatmen or yachtsmen; and from this large class of experienced watermen we hope to fill our A. C. A. register, which now numbers about 600 members. Three thousand canoes have been sold by the American builders to Americans. The A. C. A. membership should increase to 1,000 during the next yaar. Let each canoeist contribute his mite to attain this object. To do so, help the local meets and increase the local clubs.

After the members of the Lake George C. C. had completed the business of the meeting, the newly re-elected captain ordered the members present to cook a supper for those in attendance. It was a most encouraging sight to see five cooks at one time around the stove in Mr. Stoddard's kitchen, working industriously, without confusion, in preparing their individual dishes. As one set of cooks retired from the large stove, other took their places. In an hour's time the meal was upon the long dining-room table, and the club sat down to feast upon their own cooking without fear of injury to stomach or temper. All this good menu was the result of a determination on the part of the members to fit themselves for the duties of cruising canoeists; and it is expected that every gentleman who hereafter connects himself with the club will learn to cook.

Cannot an educated man learn to accomplish what an ignorant Irish girl can do?

LORNA.

AMERICAN CANOE ASSOCIATION DUES.

DR. NEIDÉ writes that he will have to drop many names from the roll before the publication of the Association book, which will be ready next month. Most of these men are active canoeists, and men to whom a dollar is no great sum, but who neglect year by year to pay their dues. While they will be a loss in one sense to the Association, some means must be taken to put an end to the evil.

Canoeists, even at such a distance that they cannot attend the meets, should take a pride in the Association, and not only join it, but use every effort to extend its influence in their immediate localities. There is no limit to the valuable work within the scope of the Association in the way of collecting information concerning our vast water courses, and this work must be done, not by a few officers, but by the mass of American canoeists. Each man, in return for such information as he can collect with little time and trouble, has at his disposal accurate data concerning almost any waters he may desire to cruise on, and in addition, if a member of A.C.A., he may obtain the addresses of fellow members ready to aid him on his cruise.

Since the executive meeting in October, nearly thirty members have joined, and there is every prospect of a large increase of membership as soon as the season opens.

Not only should the officers of a canoe club, above all others, be members, but it devolves on them to secure as many from their club as possible. The expense is but nominal, and nothing more is needed to become a member than to send $2.00 to Dr. C. A. Neidé, Schuylerville, N. Y., $1.00 for initiation fees and $1.00 for dues for current year, the further expense being but $1.00 per year, no assessments being allowed.

THE GALLEY FIRE.

MILK TOAST—COOKING FISH.

IF you have any stale bread in the locker, what is better for breakfast than coffee and milk toast? Allow a small cup of milk, with a good pinch of salt added, to come to a boil. While heating, brown the bread nicely over the stove or hot coals. Pour some boiling water over the browned bread and drain. Butter the bread plentifully, cover it with boiled milk, and you have a dish fit for a crowned head.

In frying fish have the pan hot and the fat boiling (with emphasis on the present participle) when the fish are first put in; afterward they require less heat to cook them completely through without burning on the outside. That is the secret of nicely browned fish. The hot fat cooks the outside instantly, and prevents the soaking in of the fat. All fish should be rolled before cooking on a plate of flour or meal.

To broil fish, split so that the backbone shall be in the center, sprinkle with salt and hold over a clear fire on greased broiler, open side down, until it begins to brown, then turn. When done, butter plentifully.

Fish Chowder—Wash and dress fish. Cut up one-quarter pound lean pork into small pieces and fry brown in bottom of kettle. Pare and slice one-half dozen good-sized potatoes and two onions. Place a layer of potatoes and onion in kettle then a layer of fish; dredge in a little salt, pepper and flour. Put in alternate layers as described and cover with hot water. Cover tightly and boil thirty minutes. Add one pint milk and half dozen broken crackers dipped in cold water. Cook ten minutes longer.

For a fish roasted in clay as before described in FOREST AND STREAM a simple stuffing is made thusly: Take some bread and a couple of slices of fat pork, cut up finely and season with salt, pepper, sage and savory, moisten with warm water and fill fish. Q.

NEW YORK C. C.

Editor Forest and Stream:

The annual meeting of the N. Y. Y. C. for the election of officers for 1884 was held on Feb. 28, resulting in the unanimous election of Wm. Whitlock, Commodore; C. K. Munroe, Vice-Commodore; J. F. Newman, Secretary and Treasurer; C. B. Vaux and H. O. Bailey, Executive Committee. The report of the secretary for 1883 showed an increase of ten regular and three associate members for the year, with the loss of three members by resignation and one name dropped for N. P. D.

The treasurer reported the payment of all bills against the club, as also the payment of the building debt, together with a balance of cash in hand. The club accordingly begins the year free from debt, the owner of a commodious club house, with a membership of thirty active and six associate members, and a fleet of thirty-four canoes.

It was unanimously resolved that, "in the opinion of the members present, any change in the titles of officers of the New York C. C. is inexpedient."

A vote of thanks was tendered to Mr. W. P. Stephens and friend for their successful efforts in securing the conviction and sentence of the parties arrested for attempting to rob the club house. Much interest is already evinced in preparations for the coming season. Several members are building new boats, and others are making improvements suggested by experience upon old ones. We expect to send a good representation to the local meet at Newburgh, and also to the A. C. A. meet at the Thousand Islands.

Altogether, we look forward to a very enjoyable and successful season. J. F. NEWMAN, Secretary and Treasurer.

TORONTO C. C.—The annual meeting of the Toronto Canoe Club was held on Tuesday evening at the office of Mr. Hugh Neilson. The following officers were elected for 1884-85:—Commodore, Hugh Neilson (his third term); Vice-Commodore, John T. R. Stinson; Librarian, Frank M. Nicholson; Secretary-Treasurer, Robt. Tyson. Messrs. John Hague, Charles Wesley Busk, and Erastus Wiman were elected honorary members. Mr. Stinson presented three new books to the library, and Mr. Neilson presented eight photographs of the American Canoe Association meet, at Stony Lake. The Treasurer's report shows a balance in hand of $11.75 when all liabilities are paid. The Secretary's report detailed the proceedings of last year, stating that among the prizes given for sailing and paddling races were a $25 camera, a $20 aneroid barometer, a $7.50 medal, and several other prizes of value. It was arranged that the sailing canoes of the club should in future carry a distinguishing signal on the peak of the mainsail, in the shape of a large, red ring, sixteen inches in diameter. This can be seen at a great distance. Arrangements were also made which will enable the members to participate more generally in the sailing and combined races. The smaller canoes cannot go to windward nearly as well as the larger ones with heavy centerboards, and this fact has enabled the two canoes of the latter class to monopolize the sailing class. It is now intended to give another cup exclusively for races in which there is to be no beating to windward or close-hauled sailing, with a time allowance for the smaller canoes if necessary, thereby giving a fair chance to every sailing canoe in the club. On the same principle the sailing portion of the combined paddling and sailing races will consist of one or two reaches across the wind under sail instead of the triangular course as before. A majority of the club will go to the meeting of the American Canoe Association at the Thousand Islands next August. Following the examples of other clubs, the T. C. C. will this year go in a simple and serviceable uniform, consisting of stockings, knickerbockers, and plain boating shirt, all of gray. Votes of thanks terminated a pleasant and cordial meeting.—*Toronto Globe.*

CLUB NOTES.—The Rob Roy C. C., of Indianapolis, holds meetings every two weeks for the discussion of all pertaining to canoeing.—— The Whitehall C. C. has now 11 members and 9 canoes, besides one small cutter, one yawl, and a deep catboat.——A club has been formed at Warren, Pa. They expect to be represented at Grindstone Island. ——Mr. R. W. Bailey, Pitsburgh C. C., has sold his Everson Shadow and will use a Lansingburg canoe. Mr. A. K. Nimick, of the same club, is having a 14x28 canoe built by Stephens, with patent centerboard and Albany lateens.

NEW YORK C. C.—The two young men, John Burns and Edward Styles, who were caught robbing the New York C. C.'s club house at New Brighton, were tried at Richmond on Feb. 25. Messrs. Stephens and McMurray, who made the capture, appearing as witnesses against them. Both pleading guilty to burglary in the third degree, they were sentenced to the Reformatory at Elmira. The prompt and energetic manner in which the club have followed up the matter, and the resulting conviction, will add to the security of all the boat clubs in the vicinity.

PERSONAL.—Mr. Orange Frazer has lately moved to Wilmington, Ohio. Mr. N. H. Bishop expects to be in New York about March 19.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

R. E. S., Afton, N. Y.—See article on the Dachshund this week.

T. R., South Bend, Ark.—We know of no bloodhound puppies for sale.

S. W. A., New York.—Write to Victor Hesse, 154 Market street, Newark, N. J.

H. R. S., Boston.—See note on the lamp in our issue of Dec. 20, 1883, canoeing column.

G. A. S., Marysville, Kas.—Write to Messrs. J. & W. Van Wyck, New Hamburg, Dutchess county, N. Y.

G. H. B., Derby Line, Vt.—A dispute has arisen among the sportsmen of this place in regard to the rearing of the young opossum. Will you please to tell us if the young are raised on the teat in the pocket or are they born as other animals and the pocket used as a home until they are able to run about? Ans. The young are born in the usual way, but very slightly developed, and are transferred to the teat by the mother. They remain attached to this for a long time, and after letting go their hold continue to use the marsupium, or pouch, as a refuge.

J. W. K., Marietta, O.—We do not know where you can obtain the oil-tanned buckskin pants that you desire.

F. W. G., Hartford, Conn.—We will communicate with our correspondent "Adios," and advise you of his reply.

W. A. A., Kansas City, Mo.—The pointer Donald is seven years old, by Bob out of Sappho. Le Guy is six years old, by Bang out of Juno.

F. W. B., Lynn, Mass.—You can build a canvas canoe from the drawings, though the scales are incorrect. She will be heavier than a wooden canoe.

C. F. C., Waupaca, Wis.—Please give me the address of the *Ark* and subscription price. Ans. Care Estes & Lauriat, Boston, Mass. Three dollars per annum.

BOUND VOLUMES of the FOREST AND STREAM (six month's numbers) cost $3.50 each. The charges for binding volumes, subscribers furnishing the numbers, is $1.50.

S. W. A., Jr.—We are informed by J. W. K., of Marietta, O., that he has the picture of pointer Dan, by A. Pope, Jr., and that it is published by S. E. Cassino of Boston, Mass.

SUBSCRIBER.—Can you give me receipt for cement used in fastening ferrules to the joints of a rod? Ans. Have ferrules fit perfectly and heat shellac in the ferrule and push home.

C. W. W., Boston.—Will you kindly inform an old reader when the time expires for shooting quail in Virginia and North Carolina? Ans. Virginia, February 1; North Carolina, January 1.

W. P. U., Peabody, Mass.—It was a dog that took first prize at New York in the Siberian or Ulm class in 1879, instead of a bitch. Lilly, who took second prize, was entered as pedigree unknown.

L. H. W., Pavilion, N. Y., March 5.—Quail are nearly extinct in this part of Western New York, owing rather more to severe winters than to the number served on toast. Would a few dozen from Tennessee, if shipped this month, breed so to afford us shooting next fall? Ans. Probably. But if you put them out it would be a wiser plan to forego shooting next season.

ROCK AND RYE, New York.—Fairly good trout fishing may be had along the line of the Erie Railroad. Narrowsburgh or Port Jervis, or Lackawaxen are among the places near streams that afford fair fishing. The Shohola often yields moderate sport, but the fish are not large. There are also fair trout streams in Sullivan and Ulster counties, N. Y. The Long Island streams are mostly preserved.

LIVE QUAIL, St. Catharines, Ont.—Can you inform me where I can obtain some live quail upon reasonable terms and give me the address of a reliable shipper. These birds having been pretty well thinned out in this neighborhood, some gentlemen here have formed themselves into an association for the importation and protection of them. Ans. Address Chas. Reiche & Bro., Chatham street, New York. The market price fluctuates.

PISCES, Brooklyn.—Is there not some simple way to preserve the head of fish? I have often captured fish whose heads I should like to have kept, but could not do so for lack of time. Cannot you or some of your readers furnish a way? Ans. Alcohol is used for preserving fishes. If you wish to mount them you can remove the brain and as much of the flesh as possible and dry them, with or without glass eyes. We often set heads with the opercles bent outward and nailed to shingles. This is a rude way, but is better than none.

INFORMATION WANTED.

J. W. wants to know of a wild place in Tennessee where he can camp out, and find plenty of game and fish.

C. W. A. wants to know best locality for a summer camping and fishing trip in mountains of North Carolina.

WHAT is poetical license may perhaps never be defined. The points of a perfect pen may, however, and Esterbrook's fill the bill.—*Adv.*

HUMPHREYS' HOMEOPATHIC MED. CO.
109 Fulton Street, New York.

FISHING RODS.

Having been the pioneers in the manufacture and introduction of Section Bamboo Rods, we have always taken great pride in securing and perfecting every improvement in order to maintain our position as the makers of the very best rods. Knowing not only theoretically, but also by long experience, that a properly made round rod is the only absolutely perfect rod, we have invariably refused, and still do refuse, to put our name on any but our "Best" round section rods. Our prices for these round rods average only about 40 per cent. more than the prices asked by any other makers, while the rods are widely known to be *incomparably superior.* While no hexagonal or any angular) rod can be perfect, we long believed that with proper work manship and material a *really good* angular rod could be made. Being much easier and cheaper to make than round rods, we hoped to be able to offer to those anglers who can not afford to pay the price of our "Best" round rods, a hexagonal rod that would be good and serviceable at a moderate price. We are more than satisfied with the success which has attended our efforts, for we are now able to furnish a hexagonal rod that is really worth having, and at a price which is only a trifle in advance of that asked by other makers.

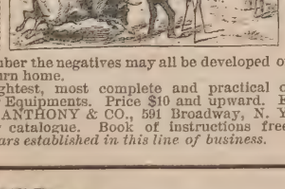
In addition to the many styles of round and hexagonal Section Bamboo Rods, we wish to call the attention of anglers to our large variety of fine Ash and Lancewood and Greenheart rods. *Every rod guaranteed absolutely hand made.*

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for 120-page illustrated catalogue.

ABBEY & IMBRIE,
48 and 50 Maiden Lane, New York City.

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,



Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

For price list address

F. LATASA, 35 Broadway, New York.

PHOTOGRAPHY MADE EASY.

The Tropicals (dry plates) are the only ones that can be used successfully in warm weather without ice.

Remember the negatives may all be developed on your return home.

The lightest, most complete and practical of Amateur Equipments. Price $10 and upward. E. & H. T. ANTHONY & CO., 591 Broadway, N. Y. Send for catalogue. Book of instructions free. *Forty years established in this line of business.*

LESLIE'S BITTERS

Excite the appetite, moderately increase the temperature of the body and force of the circulation, and give tone and strength to the system. They are the best for Cocktails.

MANUFACTURER AND DEALER OF

Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.

Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., $1.00; 120ft., $1.25; 180ft., $1.50; 240ft., $1.75; 300ft., $2.00; 450ft., $2.25; 600ft., $2.50. Any of the above Reels with Drags, 25 cts. extra; nickel plated; 50 cts. extra. Brass Click Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., $1.00; nickel plated, 50 cts. extra. Marster's celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sproat, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Aberdeeen, Sneak Bent, and all other hooks. Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders, 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 60 cts. per doz. Black Bass Flies, $1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, $1.25 to $5.00. Trout and Black Bass Fly Rods, 10ft. long, $1.50 to $10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S
Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straightened out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,
101 & 103 Duane Street New York.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, MARCH 20, 1884.

VOL. XXII.—No. 8. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

ANSWERS TO CORRESPONDENTS.

PROTECTION OF PSEUDONYMS.

A MATTER which gives some of our readers and ourselves no little trouble ought to be settled now. Many of the contributors to FOREST AND STREAM prefer to append to their letters and sketches initials, or pseudonyms, rather than to sign their full names. The true names and addresses of such writers are known only to us, and cannot be disclosed by us, without the express permission of the writer. This is an unvarying rule not only of newspaper offices, but of common decency as well. The names having been given to us in confidence, we cannot reveal them. The matter is not one in which we have any option at all. If a writer signs his contribution with a pseudonym, the inference is that he has a reason for not wishing to be known, and if he desires to conceal his identity in this way we must respect his wishes.

Every week we receive a large number of letters asking for the full names and addresses of certain correspondents, and the answering of such letters takes up a great amount of time. We therefore wish to say publicly, what we have so many times written privately, and what we supposed was known to all our readers, that the names and adresses of such of our contributors as write over pseudonyms cannot be given them. If any one wishes to correspond with any contributor the best plan is to send a letter addressed to his assumed name to this office. This letter, if accompanied by the necessary postage stamps, will be forwarded by us to the person addressed. This having been done, it remains for the contributor to determine whether or not he desires to enter into correspondence with the person addressing him. We assume no responsibility in the matter. We merely perform the clerical act of addressing the envelope, and see that it goes to the post-office.

If those who desire to communicate with our correspondents will remember this and govern themselves accordingly, we shall be greatly obliged to them.

"THE WOLF CRY IN MAINE."

UNDER the above caption a writer in your issue of Feb. 28 says "that wolves have been a thing of the past for at least thirty-five years; that the cry is the sheerest nonsense in the world, and has not a particle of foundation in fact;" and again, "there are no wolves in Maine." Having had considerable to do with the animals of Maine for the past forty years, I will state what I can prove to be facts. In 1853 wolves were very plenty, and for the next five years were not scarce, plenty could be found within sixteen miles of Bangor in 1857 and 1858. They seemed to leave quite suddenly, the last I know of positively being taken was killed by Frank Fairbanks in 1860 at Munsengun. I know the wolves were not exterminated, as from the time they were quite plenty till the time they disappeared, very few skins were brought in. They left of their own accord, just as the caribou left us. There were rumors of occasional wolves being seen from 1875 to '80, but the first real proof I can give is that in 1880 I bought the skin of a freshly killed wolf, taken at Union River. The one who brought it, said it had a mate, and they had been heard at times for several years in that vicinity. The skin is in use as a mat now in Bangor. From that date occasional wolves have been heard from, till this year they seem to have received new additions. Reliable parties report seeing them on St. Croix waters. In a recent trip to Chesuncoock I saw six different persons who had either seen wolves, or fresh tracks. Two had seen the wolves. These people were at points far apart, and did not know of what the others had told. On March 5 I saw the fresh tracks of a very large one. On my return, a man in every way reliable, told me of just seeing the tracks of three, and where they had just killed a deer near Cheno bog, within less than twenty miles of Bangor. While I consider wolves comparatively scarce, still I know they have lately gained in numbers faster than the natural increase. The Game Commissioners have done a good thing in increasing the bounty. Still wolves would have to be plenty for any one to think of hunting them much for a bounty of $10; as that can be got for an otter, and nearly that for a beaver. The writer of the article from which I have quoted says, "the poachers and pot-hunters have taken up the cry of protect the deer, and the wolves will follow." I believe he is entirely wrong there, as he is in about every other statement in his article. Of those who have reported about wolves to me, it so happens not one is, or ever has been, a deer hunter. There is no more propriety in saying that a cry about wolves has been started by the parties he names, than that the Irish have started a cry of Egyptian war to annoy England. People far apart have simply told the facts of seeing wolves, and immediately this writer charges it upon pot-hunters and poachers. If, for a man to say he has seen a wolf, is good ground for calling him a pot-hunter, poacher, crust-hunter, etc, I for one think it is time that those words became obsolete, as has been proposed for "speckled beauties," and other words. Why the man from another State, who pays no tax here, and comes in August and September and kills and wastes our game, is not as much a poacher, etc., as a man who kills a deer and eats it after the law expires, is a very hard thing for common people to see; yet some writers always see fit to call one a gentleman and the other a poacher, and are ready to charge all kinds of sins to the latter without a shadow of proof, as in the present instance. Now such a course as this does great harm. The greater part of our hunters are in favor of game laws, and are helping to sustain them, and when they are doing this, to have a thing charged to them which they never thought of, and be called hard names besides, is not pleasant, to say the least. Men not in the woods in winter have no idea of the temptations to break the laws, and still less of how well they are kept. I have this month been in two camps belonging to one concern, numbering fifty men. They had moose within two miles, they had snowshoes and guns, and were hauling beef over bad tote roads more than seventy miles, and still had not killed a moose. Can any camp of city sportsmen show a like record? And yet one of these men had seen a fresh wolf track, and so is included among those who have "started the cry." If the gluttons who are so fond of using the words poacher and pot-hunter, etc., could change places with many of those whom they call by these names, they would take a different view of things. If you wish to help protect the game, do not call those who are trying to do the same hard names.

BREWER, Maine, March 17. M. HARDY.

We presume that our correspondent scarcely intended to give us credit for the statement that there were literally no wolves in Maine. We think that if he will take the trouble to reread our remarks carefully, he will see that what we intended to say was that there are practically none. To make the bald statement that there is not a single wolf in a State as large as Maine, which has a frontier of more than two hundred miles of forest bordering on Canada and New Brunswick, is something that we presume no man of average intelligence would do.

A celebrated mineralogist once remarked in the office of a Boston assayer that "there is no gold in Massachusetts." The assayer quickly raised the point that there was some in the banks and some in men's pockets, though precious little in his. But the mineralogist answered—claiming that the assayer knew his meaning—no native gold in the soil of the State. The assayer again raised exceptions to his friend's statement, and offered to get a few bushels of the soil of Boston even, and by close chemical analysis to obtain pure gold from it. Both were right.

There are practically no wolves in Maine, notwithstanding the tracks seen by those who "know wolf tracks," mentioned by our correspondent. They were practically exterminated years ago. Our correspondent has seen tracks that were tracks, and others have seen them, and yet the only actual wolf he brings to our attention is the one killed in the spring of 1881, and heralded at the time in all the newspapers of the State, since which time they have made little note of wolves killed in that State. Our correspondent brings us no other practical wolf, only tracks, and until he sends us an authentic account of another wolf, killed in Maine, we shall take no back tracks in our position on the wolf question.

We are glad to learn, from what Mr. Hardy writes, that the sentiment in Maine is now against killing deer, moose, and caribou out of season, and that the practice of crusting is becoming obsolete. If this is so, it is a matter for congratulation to the inhabitants of Maine first, and afterward to all those who are interested in the protection of game. Men who kill game out of season are poachers, and we are anxious to see all violators of the law, not only in Maine but in all other States, punished; and we do not see how it can make a particle of difference whether these violators are natives of Maine, New York, Siberia, or New Guinea. A law-breaker should be punished, no matter what his State or county. The game must be protected in the close season from Maine men, Rhode Island men, South Africans, or Chinamen.

This protection is what we are all working for, Mr. Hardy as well as others, and we presume that he will assent to our propositions.

FISHING THROUGH THE ICE.

A BILL introduced into the Legislature of New Jersey forbiding fishing through the ice failed to pass. We think this a move in the right direction, and one that might be followed by several States. In the vicinity of the Great Lakes winter fishing is a legitimate mode of supplying the markets with many species of fish, and in Maine the smelt fisheries are so prosecuted. But in the small lakes of the Eastern States, where the fish are protected in order to furnish angling, all winter fishing should be stopped.

In winter some fish take the bait, and fishing through the ice for pickerel is one mode of exterminating them, which yields a greater or less supply of fish, but nothing that can well be classed as sport. The fish do not fight vigorously, and are ignominiously lugged in by main strength on a short hand line, after hooking themselves and raising a signal, warning the attendant, who often has from thirty to fifty lines set. When winter locks the waters the fish should have a rest, and it is only the commercial fisheries mentioned which should be prosecuted at that time. All waters which afford good fishing and are within easy distance of any city, now attract a class of anglers which leaves with the hotels and guides ten times the value of the fish caught, and therefore such lakes and streams are of more value than they were a generation ago, when a fish was thought to be worth more when dead than alive.

We have fished through the ice in schoolboy days, and watched the "tip-ups," while frigid feet and tingling fingers made it doubtful whether we were having much fun or not, but we would have no doubts on that question now. We hope the New Jersey bill will come up next year and pass.

RIFLES OF TO-DAY.—In our rifle columns we offer a series of articles in which the several rifles now upon the market will be illustrated and described. The intention is to give the readers of FOREST AND STREAM a clear idea of what is now offered in the way of breechloading rifles. By means of cuts and cross sections of the breech mechanism, the characteristics of each arm may be easily studied. What the arms have done in the way of records; what is especially claimed for them; what they cost in the various models, and in general all the questions which a careful purchaser would put, will be answered as far as may be, leaving it to those who read to make their own comparisons.

MIGRATORY QUAIL.—An item in the Rutland, Vt., *Herald* of March 10, says: "A correspondent writes us from Manchester as follows: 'We have seen several flocks of Mr. Everts' quail, and they are looking finely.'" The introduction of this species has not been markedly successful, but if those turned out by Mr. Everts have done well, we are very glad to hear of it. It is now seven or eight years since the first of these birds were imported, and for the last two or three but little has been heard of them. We understand, however, that Mr. Braun has orders for some additional importations this spring. The birds can only be obtained in Sicily during the month of April.

LOOK OUT FOR THE SNIPE.—If this weather holds English snipe may be looked for in this latitude before very many days. They do not usually make their appearance in any numbers much before the first of April. We shall be glad to hear of the first arrivals.

The Sportsman Tourist.

BETWEEN THE LAKES.

Seventh Paper.

ODDS AND ENDS.

JEROMEVILLE is a splendid illustration of the adage "There is nothing in a name." To one acquainted with the region it would suggest at least the beginning of a town with a primitive, cheap and dirty hotel, slab cabins, a nasty "doggery" and a strong smelling store. But Jeromeville is not even that. It contains but one house—a station house made of pine boards, in which a section boss and his family live, and two or three section men are lodged. There is a switch close at hand enabling the trains to pass each other, and a red flag belongs in the house with which certain trains may be flagged and stray fishermen, hunters or lumbermen be taken on board. A mile west of Jeromeville is a recently abandoned lumber camp, Camp No. 1, and a half mile east is another—a remotely abandoned one. The time was, and that no longer ago than the past winter, when there was a great show of business at Camp No. 1. Probably sixty men—choppers, sawyers, "road monkeys," haulers, skidders, cooks, clerks and bosses—made that camp their headquarters while engaged in the work of forest destruction. And there were other destructionists there also. The deer hunters congregated there and at one time during the past winter a hundred and fifty carcasses of deer were piled up in the camp warehouse. And the slaughter was kept up from early fall till late in the winter, and what was the grand total of butchered deer in that neighborhood? I am sure I do not know, but probably not far from a thousand.

At this rate how long will the game last? Jeromeville is in the midst of the woods. Hemlocks, maples, balsams, pines grow skyward all around save in the hundred-foot strip chopped out for the railroad track. Standing in the center of that track in front of Jeromeville, and looking east, one has an unobstructed view of thirty-four miles. The railroad track lies upon the section line that distance as nearly as the engineer could fix it. This entire distance leads through the Manistique region—the *Onominitik* of the red men, which means bog iron ore. Much of this mineral, I am told, can be found in this region. The Manistique, rising in springs from the great Potsdam sandstone ridge, in the north side of which the chafing waters of Lake Superior have cut those stupendous cliffs known as the Pictured Rocks, flows southeasterly till it crosses the railroad at a point twenty-six miles east of Jeromeville, where it soon strikes the western flanks of the Niagara limestone beds, of which the southeastern part of the Peninsula is built up, and thence it meanders southwesterly along the valley, between the limestone outcropping and the Potsdam sandstones, and finally enters Lake Michigan about seventy-five miles west of the Straits of Macinac. All its northern tributaries have their sources in the same great sandstone ridge, and all flow southeasterly or at right angles with the valley between the two rock systems through which the main river runs, and all are trout-bearing. The Manistique region lying north and west of the river contains in round numbers about one thousand square miles, most of which is quite level and much of it swampy.

Vast forests of timber cover the greater part of the Manistique slope, a great deal of which is valuable pine timber; but it is so interspersed with hard wood timber and swamps, that fires do not sweep through the woods, blackening and blasting the country, as is the case in the Lower Peninsula.

From Jeromeville to the Manistique the railroad crosses ten tributaries to the Manistique, every one of which, so far as I have investigated, is found to be a trout stream. I know that two or three that meander through swampy plains west of Seney do not contain trout near the railroad, but these, as well as all the other tributaries, flow from the sandstone lying to the north, and I venture the assertion with the utmost confidence, that every stream rising in the Potsdam formation, will be found at some point along its course, a trout-bearing stream.

The eastern tributaries of the Manistique running down from the limestone hills, are short and insignificant. Trout will not be found in them. But to Manistique Lakes—North Manistique, Manistique and South Manistique—are reputed to be excellent bass waters. North Manistique is about four miles from McMillan, on the railroad, from which a good wagon road leads to it, and the lakes are connected by small streams, so that the voyager may float from one to the other. Or the sportsman can descend the Fox from Seney to the outlet of the lakes, and row up that two miles and enter the largest one of the three.

It is unfortunate that the tributaries of the Manistique having their source in the highlands between the two lakes should all be designated on the maps as branches—the East branch, the North branch, the Northwest branch, the West branch, and the like. Three of these, the East branch, the Northwest and the West, have local names. The East, on which Seney is located, is known as Fox River. The Indian name was Neenah, and it is a pity that name has not been kept alive. The Northwest branch is locally known as Stuch's Creek, and the West branch is generally known as Indian River, from the fact that upon its banks and along the shores of the quite extensive island lake into which it widens, the Indians in former times had numerous wig wams.

From time immemorial the Ojibwas inhabited the Upper Peninsula, and a feeble remnant of that once powerful tribe have a foothold there yet. But for some reason they have signally failed to leave the record of their existence as the once lords of the land in the names of its geographical features. The Tequamenon and Manistique rivers and Munising are about all the names that occur to me now of Indian origin. The only places named are along the shores of the great lakes and along the line of the railroad. Elsewhere there are no permanent residents, and names are unknown. For the present we must be content with the branches.

The Fox River abounds in the pike-perch or jack salmon. A revolving spoon is cast into the swift waters and proves to be a killing bait. The headwaters of the Fox and of the Manistique itself are capital trout streams, but of this hereafter. Let us return to our camp at Jeromeville.

The last was an unprecedentedly wet summer in the woods, which not only aggravated the insect pests, but sadly interfered with trout fishing. By reason of the gradual descent of the Manistique slope, its streams remain swollen many days after a heavy rain. A stream affording excellent trout fishing one day may not show a rise to a fly for a week after. One day the Greek Professor went to the west branch of the North branch, two and a half miles east of Jeromeville, and caught twenty-five trout—fine ones at that—in three hours. Within a day or so a heavy rain fell, and returning soon after he could not get a rise, notwithstanding he painstakingly went over the entire ground.

The summer before the Judge had tried the Southwest branch, or Stuch's Creek, at a point a little west of south from Jeromeville, with such success that he determined to try the same stream again, but at a different place. This stream takes its rise a little south of Munising Station, as we have seen, and runs southeastwardly. From the map it appeared that a tramp two and a half miles due west from camp, the first mile of which was on the rail, would take one to the creek at a point where it turned its course southward. The Judge struck for that point, and after crossing a thick woods and then a tamarac swamp, he came to the stream he sought for. It meandered through an ancient beaver meadow, intersected by frequent beaver canals and covered by an almost impenetrable growth of black elders.

The day was mild, with a soft breeze from the southwest occasionally coming in gusty puffs and rippling the surface of the pools, while the sky was clear, save wisps of white clouds here and there, hanging apparently motionless in the blue ether. Tying a red handkerchief to the top of one of the tallest alders, to mark the place, the Judge deposited his gun and lunch at its roots, and jointing his rod and tying on a brown hackle—his favorite fly—he quietly parted the alders and dropped the lure lightly on the stream. Floating swiftly down to a bunch of grass and dead twigs clinging to a depending alder branch, there came a splash and a tug, and presently a beautiful trout lay gasping on the bank. During the three ensuing hours the fisherman knew nothing—thought of nothing—save the trout that gave little rest to his hooks. No one had ever been there before him. Not a tuft of trodden grass save by deer hoofs was to be seen, and not an alder had been broken by man. He was fishing on primitive ground, and in virgin waters, and so absorbed did he become as he slowly pursued his way up stream, casting here and casting there, and in quick succession lifting from the pools their gamy denizens, that, when a very red doe came from out the thicket to slake its thirst and crop the tender grass, the Judge was all unconscious of its presence, till he heard its repeated stamps of defiance less than twenty yards away. Less than three hundred yards he fished along the Stuch that day, and when he found his load was made up, he counted thirty-five trout, twenty-five of which weighed from eight to fifteen ounces each. When the afternon train passed Jeromeville for Marquette, the red flag was hung over the track, and when the train was brought to a stand, the twenty-five trout were consigned to the care of the conductor with instructions to hand them over to Mr. Frank Milligan, an officer of the road, who never failed to show us a favor when opportunity presented.

That night there came a tempest of rain, and a few days thereafter the Judge with his daughter set forth on a visit to Stuch's Creek at still another point. Within the past year a wagon road had been cut through from the railroad at Camp No. 1, one mile west of Jeromeville, south to the town of Manistique, at the mouth of the river by that name, and five miles from the railroad it crossed Stuch's Creek. Rumor said trout were to be taken there of large size; but when the two reached the long bridge crossing the stream and low ground on either side, they found the waters so swollen from the recent rain that it was with difficulty that the banks of the stream could be reached and never a trout raised to fly or took a bait.

Some distance below the bridge the land-lookers say there are some ancient beaver dams and much deep water. In this water, trout may be caught which kick the beam at two and a half and three pounds, so the said land-lookers say. No one has ever voyaged down the Northwest branch however, that remains a thing for a couple of patient, plucky anglers to accomplish. This the Judge expected to attempt when in the country the past summer, but the sickness at home deranged his plans and he had to abandon it.

A branch of the West branch runs within a stone's throw of Jeromeville, and a mile above the railroad it gives excellent fishing. We went up stream one day and found it open and comparatively free from brush. Below the bridge the fishing is not so good because of the brush, but even there I caught a nice basket of trout one day.

From the abandoned lumber camp half a mile east of Jeromeville an old "tote" road runs south half a mile, where it crosses the Jeromeville branch, and at that point there is said to be excellent trout fishing. A glance at the map disclosed to us that if we would go half a mile east of Jeromeville and, leaving the railroad, travel through the woods two and a half miles north, then go half a mile east again, we would strike the west branch of the North branch, where we had no doubt trout fishing would be found to be first-rate. The railroad crosses this west branch of the North branch two and a half miles east of Jeromeville, and we know from actual experiment that the stream here contains many and fine trout. Pounders are not infrequently taken. Half a mile further on the North branch is crossed, and here, too, the trout fisherman will find his pleasure. And so, it is to be seen that Jeromeville is a trout center.

Our camping days at this place passed all too swiftly by. With a little hunting and a good deal of fishing, we soon found that the time of our stay in the woods was nearing its close. Our tent stood in the edge of a grove of beeches and maples and hemlocks, whose drooping branches were covered with a mantle of green. High overhead a gigantic white pine held out its short arms and whispered to us sweet lullabys in the night breezes. Near its base we built our camp-fire, and around that we loved to gather of evenings and watch the wavering flames and clouds of sparkles that soared into the green foliage and to recount the incidents of each day.

But let us linger here no longer. The time has come for us to break camp and go home. The Greek Professor has forgotten that he ever had a "lump" in his throat, and my "dizziness" is a thing of the past. It is time we return to the busy work-a-day world.

* * * * * * *

Since the FOREST AND STREAM began the publication of the "Between the Lakes" papers, I dropped in one evening to have a friendly chat with the Greek Professor. On the table before him was open paper. He had been reading of his exploits in the woods, and his brows were knit. In one corner of his room stood a brand new breechloading rifle of approved pattern. Over his head, Bryant looked benignantly down, and from the further side Longfellow smiled complacently. The Quaker poet was not there. The Greek Professor was evidently in a warlike mood. "Don't you remember," said he, "the day you stuck fast in the bog, and I had to fish you out?"

"Well," said I, "I do have a slight recollection of something happening at some time to somebody something like that," and in turn I knitted my brows.

"Well, why didn't you tell that?" he asked me.

"I forgot it," I boldly said.

"I have it, and what is more, I am going to write to the editor about it myself."

"Do!" said I; "and don't forget to tell him about the experiment you and Oscar made with our half pint of whisky and the birch sap."

And then he rubbed his hands and laughed genially.

But he is going to write to the editor, nevertheless. He is bound to have his say, and I am glad of it.

D. D. BANTA.

ROPING THE BLACK-TAILS.

"WE'LL drive in all the horses we can find on the range to-day, boys," remarked Mr. French, or, as he is usually known, "Pete," one of the most popular cattle men in Oregon. He whistled to the hounds, and, followed by us boys, headed toward the long, gradual rise forming the north end of the Stein Mountain range.

From the starting point on the flat to the summit is fifteen miles. For the first half of the distance the ground is covered with low sage brush and bunch grass, and dotted with juniper trees. But the latter half, over which a few inches of snow lay, is without sage brush, while there are dense thickets in every little hollow on the hillsides, here and there a patch of small quaking asps, and along the banks of the numerous creeks a scattering of cottonwoods.

There are sufficient rocks and stones scattered about to render riding a little dangerous, and the sides of the cañons are steep enough to assure one at a glance that, once fairly started down the incline, there was no chance of stopping till the bottom was reached. No place I have seen seems so natural a deer park, and, judging from the number to be seen at all times, the deer are evidently of the same opinion.

We were all well mounted, each had his *reata* or lasso, and displayed the usual number of colors that a collection of cowboys or *vaqueros*, Spanish and American, always can boast of, which is every shade. The long wool Angora *chaperos* or leggings, and the elaborately-stamped heavy Mexican saddles, the stirrups covered with leather *tapaderos*, long and pointed, almost touching the ground, increased our somewhat picturesque appearance.

Two fine Scotch stags, three or four greyhounds, and as many more a cross between the two, scampered round us on all sides as we rode up a slight hollow.

A sharp bark, followed by a one-line chorus, and Pete's "There he goes" was answered by a volley of "*Caramba*s" and a free use of spurs. The deer was off to the right, out of view for the first few jumps, but a gentle rise soon brought in sight a splendid pair of antlers, and another shout burst from every one. He wavered an instant and turned toward the hollow we had just left, thus shortening by almost a half the little intervening distance. Four bounds into the hollow, and he was in view of all. Three hounds were together, almost within springing distance, and Pete, close on them, was swinging his rope and shouting "*reata*," followed by us. The yelps of the dogs as they got out of the way of the horses, which, all alive to the sport, needed no spurring to do their best; the whir-r of the rawhide lassoes which every man swung, all eager for an opportunity to throw them, altogether made up a scene to make the most sober excited, and cause his blood to tingle for many a minute after. Two more springs and he would be among the sage brush and rocks. The dogs seemed to know it. They sprang together, and as they brought him to the ground three loops dropped over his horns, and a loud hurrah rang through the clear frosty air.

It was hardly ten minutes after we had swung our buck over a juniper limb, that a pair of long ears were outlined against the sky, then another, and another, not two hundred yards away. The dogs were soon in full cry, and away the deer started at a gentle trot, thirteen head followed by two fine bucks.

It was a pretty stretch of level country for half a mile, and they were making straight across it to a cañon. Scarcely a minute elapsed before the hounds were within a few yards of them, and we were following closely. Again the shouts of "*reata*" was echoed on all sides, as the boys formed and swung open the loops of their trusty ropes.

"We'll lose them if they reach the cañon," said Pete, and he shot ahead of us, but only for a few seconds, as he stopped his horse with a jerk, and just in time. There was a "jump-off" of quite a height, and down the deer all went, Bluey, one of the crosses, fastening to the last, a yearling buck, and together they rolled into a dense tangle of small brush. Half of us scrambled down, for "where a dog can go a horse can," is nearly true of the cow ponies of the West. Not a sign could we see, when not thirty feet from us, the two bucks cleared a clump of willows, and crashed their way through the dead brush and rocks, down the cañon. Pursuit was almost impossible, but away went the pups and a couple of Spaniards.

"There are more yet; surround that thicket and look sharp, boys. We'll have them yet," said Pete excitedly. Hardly had he spoken when six jumped up, and over a rocky ledge left unguarded, and away. "Stay with them boys, more yet; I'll start them. Look out," and he dashed into the brush. "Now, you have 'em, Gov'nor." "Lass' a-lay" and "*reata*" re-echoed from the rim rocks, as if there were five score voices. I could see but a dozen yards up a small trail leading out of the brush, but heard barks close at hand. My *reata* was ready, when, like a streak of light, a fawn came in sight, sprang aside at seeing me, and rolled over with Bluey firmly attached again, while following came a boy so close as almost to take part in the tumble. It was a doe, and more frightened than hurt, so driving off the dogs and calling her "poor, little girl," and other endearing terms, we cut an "under bit out of the left" (Pete's well-known ear mark) and let her go.

There were several other dashes 'cross country, and not after horses! We did come across two of the latter by accident toward the end of the day, and drove them before us, the result of our horse hunt.

"Strange we saw so few," said Pete at supper. "We saw a few deer, though, sir," remarked a vaquero. "Yes, and as nearly as I can judge fully three hundred." And he did not overstate the number.

GOV'NOR.

STEIN MOUNTAIN, Oregon.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

Fourteenth Paper—Folk-Lore.

[*Concluded.*]

THE CAUSE OF SPOTS ON THE MOON.

LONG ago there lived a man, who had a wife and son, and his wife was not faithful to him. She ran away with another man. But the woman loved her son, and would often disguise herself in men's clothing and go and talk and play with him. Now one day, after the woman had visited her son, the little boy said to his father, "I think I know my mother. It is she who comes often, dressed in men's clothes, and plays with me and tells me stories." Then said his father, "When she comes again ask her to make you some arrows and a bow."

Not long after she came again, and the little boy said, "Oh, my friend, please make me a bow and some arrows so I can shoot the little birds," and his mother commenced to make them. When she had finished an arrow, the boy's father came in and looked at the arrow and knew that no man made it, and he said to the woman, "You are my wife," and she was afraid, and did not deny it. Then the man took his knife and cut her to pieces, and threw the pieces out of the lodge; but instead of falling to the ground they went way above and stuck on the moon. You can see them yet, the spots on the moon.

THE WOLF-MAN.

There was once a man who had two wives. They were unfaithful. Very bad were their hearts. So the man left the main camp and lived way out on the prairie with his bad wives. And one of his wives said to the other, "Let us kill our husband and go back to the main camp, where we may see our lovers." Now, near where they were camped was a tall butte, and every night when he came home the man would go up on it and sit and look all over the prairie to see where the buffalo were feeding and to see if any enemies were coming. And on top of the butte was a buffalo bull's skull, upon which he would sit.

One day, when he was out hunting, the women went up on the butte and dug a deep pit in it. Then they covered the mouth of it with small sticks, earth and grass, and placed the buffalo skull on top. When the sun was almost down they saw their husband coming home, the dogs loaded down with the meat he had killed. "There he is, there he is," they cried, "let us hurry and get his supper." And when he had finished eating he went up on the butte, and when he seated himself on the buffalo skull the slender sticks gave way and he was thrown to the bottom of the pit. When his wives heard him cry, they looked, but could not see him, so they knew he was in the pit, and they quickly packed the lodge on the dog *travois* and moved into the main camp. "Where is your husband?" the people asked. "Three days ago he went out to hunt, and has not returned. We fear he is killed," they replied.

Now when the man fell down into the pit he cried, and a wolf heard him. The wolf said, "I hear a person crying," and looking about he soon discovered the man in the pit. Then the wolf howled, *Ah-h-w-o-o-o-o-o-o-o, ah-h-w-o-o-o-o-o-o-o!* And when the other wolves heard him they came running to see what was the matter. There came also many coyotes, black wolves, red foxes, kit foxes, badgers and mice; the little mice came too. And when they were all come, the wolf who had found the man said, "Here is my find. In this hole is a fallen-in-somehow-man; let us take pity on him and dig him out, and we will have him for a brother." Then all the animals commenced to dig, and soon had a hole almost to the man. And when they had dug very close to him, the find-him wolf called out, "Hold on; I want to say something," and when all the animals were listening he said, "Now I found this man. We will all have him for our brother, but I claim that he ought to live with us big wolves, for I found him." All the animals agreeing to this, the big wolf went down in the hole, and tearing down the rest of the dirt dragged the almost dead man out. And when they had given him a kidney to eat, the big wolves took him to their holes; and they brought him to the hole of a big blind medicine wolf, and the medicine wolf made wolf paws and a wolf head on him. The rest of his body was like a man's.

Now, in these days the people caught buffalo in pĭs-kans,* and all around these pĭs-kans they made openings and set nooses in them, so when the wolves came to steal meat they were caught by the neck. One night the wolves all went down to steal meat, and when they had come close to the pĭs-kan the man-wolf said; "Sit here all of you, and I will go first and fix the places so you will not get killed," and he went first and sprung all the nooses. Then he went back and called all the wolves and the others, the coyotes, foxes and badgers, and they all went in the pĭs-kan and feasted, and took meat to carry home.

In the morning, the people were surprised to find all their nooses drawn out, and they said, "Perhaps it was what?" Many nights were the nooses drawn out and their meat stolen by the wolves. One night when the wolves came they found only bad bull's meat and the man-wolf was angry, and he howled out, "Ah-bad-you-give-us-o-o-o-o-o," and the people heard and said, "It is a man-wolf who has done all this." So they put dried meat, pemmican and tongues in the pĭs-kan, and many people hid in there.

The next night when the man-wolf came he saw the good food and ran to it, then the men all jumped up and caught him with ropes, and they took him to camp. When they took him into a lodge by the fire they knew him, and said, "Here is the man his wives said was killed," and they brought his wives into the lodge. Then the man-wolf told what his wives had done, and they were immediately killed.

THE THUNDER BIRD.

None of the people knew what the thunder was, and the people often talked about it, and said, "Perhaps it is what?" Now, once the people moved toward the Sweetgrass hills after buffalo, and one day when they were traveling two boys found a queer bird on the prairie, and caught it and carried it to their father's lodge, and many people came in to look at it, for no one had seen a bird like it, and while they were talking it suddenly arose and flew out the smoke-hole of the lodge, and a great thunder shook the lodge, and knocked the people down, and they knew then that it was the bird which made the thunder.

The rainbow is called Năp'-ĭ-ō-tō--kăh-tchĭs, Old Man's lariat; or, more correctly, Old Man's catching instrument. When he wishes the rain to cease he throws out this lariat and catches it all.

The constellation Pleiades is termed the E-kĭt-sĭ'-kûm, even, and the legend is, that a woman once had seven bad children, and that one day she threw them up in the sky, where they were changed into stars.

Sun-dogs are said to be fires lighted by the sun to warn the people that danger is near. "When you see the signal fires, watch, for the enemy is coming."

The foregoing legends are all that the writer has learned thus far, which may with propriety be printed in a public journal.

The Blackfoot language is an exceedingly difficult one to master, and the writer has decided to omit any remarks upon it, for as yet he is not sufficiently versed in it to give any very valuable information regarding its peculiarities. Below is an interlinear translation of the story of the "Wind-maker," which will give some information regarding the structure of the language.

Ō-mĕks'-ĭks-ah	săm'-ĭ-au	ĭt-sĭn-ō'-yō-au	ĭ'-so-pōm-stan
They	hunted	saw they	wind-maker
ĕ-tăh-wah'-kwō-e-au	e-tōt'-eks-sō-pwō'-e	e-tō-mût'-up-	
chased him they	came very wind	commenced	
sō-pwō-e	e-tûn'-ûk-ō-pō-pō-kĭ-yĕk-au	ah-wah-kwō-ye	
wind	blown off they	chased him	
ō-mĕ'	ō'-mûk-sĭ-kĭm-ĭ	e-tûh-pûs'-kwō-e-au	ĕt-sū'ō-mûk-ĭ-yĕk
That	big water	chased him toward	under ran
ĭt-sū-ō-wût-sĭn-ĭ-yek-au	ĭt-sĭk-sō-pwō-e	KĭN'-yĭ-yĭ	
saw him no more they	ceased wind	That's it	
ĭt-sĭn-ō'-ye-au	ĭ'-sō-pōm-stan	ĭ'sō-pōm-stan	Kish-tsĭ-pek-se
saw him	Wind maker	Wind maker	Spotted animal
năt'-ōt-sĭ-nûm	ĭn-ō-yo'	ŭhk-sō-yĭs	ĭn-ō-yĕ'	ō-tō-kĭsts
like color	long	his tail	long	his ears
ĕt-sĭn-ûs'-tse.				
down hang.				

Free translation: Some hunters once saw the wind-maker and chased him; there came a strong wind which blew them off, but, persisting, they chased the animal into the lake, and as soon as he disappeared under the water the wind ceased blowing. Then they knew that they had seen the Wind-maker. He was a spotted animal, and had a long tail, and long ears which hung down.

---

*The following account of the Blackfeet pis-kan was given by Mr. Schultz in FOREST AND STREAM of June 1, 1882:

Not so very long ago I happened to be camped with a gens of the Pe-gun-ny, at a place called Willows Round, situated some fifteen miles above here, on the Marias River. Early in the evening I saw old Po-kah-yah-yi, in whose lodge I was stopping, ascend a steep bluff not far off, and, giving him time to reach the top, I followed, and was soon seated by his side. Directly opposite us across the river were the remains of pis-kan, or, as the white men out here call it, a "buffalo pound." Why so called I cannot say, the literal translation of the word "pis-kan" being "falling off place." "Now, my friend," said I, after I had regained my breath, "tell me all about that pis-kan. How did you make it; how many buffalo did you catch in one day; and how many winters ago did you use it?"

The old man's story was as follows:

"In those days we had no guns, but used to kill many buffalo with bows and arrows; and sometimes we used the pis-kan. When we made a pis-kan, we first found a little open glade by the river where the prairie came down and ended in a cut bank as high as a man. From this cut bank we built a strong fence clear around the edge of the glade. We used big trees to make the fence—logs and sticks, and anything that would help to keep the buffalo from breaking out. Then we built two lines of stone piles far out on the prairie, two lines that ever diverged from each other. Then the pis-kan was built.

"The night before we intended to make a drive we always had a buffalo dance. All the people danced. The medicine men all wore buffalo robes, and sung the buffalo songs. Every one prayed to their secret helpers for good luck. Early the next morning the people went out, and hid behind the stone piles on the prairie. The medicine man who was going to call the buffalo put on a buffalo robe, hair side out, and sitting down smoked one pipe to the sun. Then he spoke to his wives and all the women of his lodge, saying, 'You must not go outside until I return. You must not look out of the doorway or any hole. Take this sweet grass,' giving it to his head wife, 'and every little while burn a small part of it so that the sun will be glad. Pray that we will have good luck.' Then he mounted a dark colored horse and rode out on the prairie. When he came near a band of buffalo he began to ride quickly in circles and cried out to the buffalo, saying, '*E-ne-uh! E-ne-uh!*' (meaning buffalo). The buffalo were first a little scared; then they began to follow him slowly, and soon ran after him as fast as they could. Then the medicine man rode into the shoot, and after the buffalo had also run in he jumped out to one side of the stone piles, and the herd passed by. The people behind kept rising up and shouting, which made them run all the faster. The buffalo in the head of the band were afraid of the stone piles, and kept right on in the middle of the shoot; those in the rear were scared by the people continually rising behind them, and so pushed the leaders ahead. When the band had got close to the edge of the pis-kan, all the people closed in on them and with a great shout drove them over the cut bank into the inclosure. Then with their bows and arrows, the men killed all the buffalo; even the old bulls were killed. The fattest cows were then marked for the chiefs and medicine men by placing sticks on the tails, and the rest were divided up among the people."

The above narrative is true in every respect. As late as 1865 the Pe-gun-ny used these pis-kans on the Upper Marias. Mr. Jos. Kipp, the well-known Indian trader, tells me that in 1864 he saw the Pe-gun-ny capture over seventy-five head of buffalo in this manner. Sometimes three or four drives were made in one day. About seventy-five buffalo were the average drive, though sometimes more than a hundred were taken.

SOME OF HIS SPORTING ADVENTURES, AS MODESTLY SET FORTH BY HIS OWN HAND.

Chapter VII.

ADIRONDA, a vast tract of primeval forest in the midst of a country that has long been settled and "improved," as it is the fashion to term those portions of the earth which have been spoiled by the hands of civilized man, is such a delightful resort for the tired dwellers in cities, for invalids and for those who desire to season their dull lives with a spice of mild adventure, that it is altogether desirable that it should be set apart as a State park, and henceforth saved from the destroying axe of the tree-murdering lumberman. A more important consideration than these from the utilitarian point of view, is the dependence of the lives of great rivers on the preservation of this great tract of land-shading and water-staying woodland. If it were not for this danger to awaken the power that rules, the lovers of the grand old woods might prepare their garments of sackcloth and gather their ashes while there are yet ashes to be gathered, and be ready for the day of mourning.

It was brought to my mind in speaking of the lake of the singing fishes, what countless beautiful and curious lakes lie in that region, many of which, I doubt not, have never yet mirrored the form of a white man, while there are many more that but few white men have beheld. One of these in particular I remember, which I never have heard mentioned nor seen one word written of till now. It is a small body of very salt water lying in a rock-rimmed bowl of mountains in the very heart of Adironda, and is very beautiful; but its beauty is outdone by the singularity of its saline character, and its cause. It is not fed by salt springs on its shores nor in its bottom, in fact, it has no inlet of any sort; the small trout brooks of the surrounding mountains discharging elsewhere, and it has no visible outlet—probably has none.

Three hundred years ago, as nearly as Indian tradition indicates, the basin that now holds the lake was a dry valley. On a certain time a great horde of Adirondacs and Abenakis on the one side and as great a one of all the nations of the Iroquois on the other, met here in a deadly conflict that lasted for several days. Heaps on heaps were slain of both wild armies, but neither was victorious, and both withdrew, leaving their dead upon the field. A month later all the women of the nations engaged repaired thither to weep over their slaughtered braves, and abode there, so doing, for many days, and at the end of a fortnight their tears had filled the little vale with salt water. And every year, for hundreds of years after, about the anniversary of the battle, the mourning women came there and wept for nearly a month, thus keeping the lake full. I should be inclined to relegate this tale to the realm of fabulous tradition, if I had not myself seen hundreds of squaws sitting upon the shores and raining down showers of tears for their moldered ancestors, little salt rivulets trickling down from each group to the lake, through the white sand, composed almost entirely of the crumbled bones and flint arrows and spears of the long-slain warriors. Therefore I have no doubt the lake owes its origin to this source. Yet these later comers, not feeling the poignancy of grief which affected the earlier mourners, may have contributed something in a way which is given to those who are denied many tears.

Some sea fish are found in its waters as well as oysters, clams and the like, the spawn of which was doubtless brought by the seafowl that frequently visit it. I thought once that I had discovered seaweed there, but found, upon inquiry among my Indian acquaintances, both Iroquois and Abenakis, that once upon a mourning time there outbroke a battle between the squaws as to which sorrowed most, when many scalps without skin were clawed off, after the fashion of civilized women, and my seaweed was only the water-soaked trophies of that Amazonian conflict. As the mourners grow fewer with the rapid passing away of the Indian race, the lake shrinks, but becomes no less salt, except in seasons of exceeding wetness, and for those who would have the heart of the wooods in large and the seaside in miniature in conjunction, I know of no more delightful resort than this sheet of water, which the Iroquios call Kanyatare-Keaheya, the Lake of Death, and the Abenakis, Nebisi Waldam-Wogan, the Water of Sorrow, or Lake of Tears.

If one would visit it from the East, let him leave Lake Champlain at Westport, Essex or Plattsburgh and go toward it till he comes to it, upon doing which he cannot mistake it for any other lake in Adironda, either by the tests of sight, taste or smell. If one would come to it from any other point I cannot give him better instructions for doing so.

It freezes much later than other lakes of that region. I have seen it open at the end of October, when as all know, winter reigns there supreme and undisputed. I have seen in November a polar bear traversing its frozen surface, and have killed more than one seal there, as well as the blue Arctic fox. Is it not strange that these animals of the far North should have been led to it so far from their wonted abode? By what light intangible ethereal thread were they drawn? Of this and things akin I hope to say something further on. MAJOR JOSEPH VERITY, U.S.H.M.

ADIRONDA.

Natural History.

THE DEER OF THE OTTAWA VALLEY.

BY WILLIAM PITTMAN LETT.

[Read before the Field Naturalists' Club of the City of Ottawa, Ontario, Canada, on the 18th day of March, 1884.]

[*Continued from Page* 124.]

THE MOOSE.

THE moose deer (*Alces americana*) or *Alces malchis*, according to Linnæus, is the largest of all deer now existing in the world, although much inferior in size to the ancient Irish elk, which must have been an animal of gigantic proportions, if we are to judge from the size and weight of the ponderous antlers found occasionally in the bogs of Ireland. Some of those great horns have been discovered with a spread of twelve feet, which fact will give some idea of the magnitude of the animal which carried in the old days of the powerful wolfdog such enormous horns.

The American moose, according to the conclusions of all scientific naturalists, is a true elk, identical with the Scandinavian and Asiatic elks. A full-grown moose of the largest size, when fat and up to its heaviest weight, will weigh upwards of fifteen hundred pounds. A bull moose of this description is as tall as the largest horse. The body and neck, for so tall an animal, are short and stout—the neck unusually so—and is covered with a thick mass of strong, bristly hair rising into a stiff mane, which, when the animal is irritated, stands on end like the mane of a lion, and gives the infuriated beast a frightful and formidable aspect. The legs are long and bony; and although ungainly in appearance, are as clean cut and as compact as the limbs of a racer. The head is enormously large, and altogether deficient in the points of grace and beauty peculiar to nearly all the other branches of the deer genus. The fleshy part of the upper jaw terminates with a long, flexible upper lip, with prehensile powers, used by the animal in seizing the twigs and branches of trees upon which it feeds. The nostrils are long and wide, and the eyes somewhat small in proportion to the size of the animal. The hoofs are large and shaped like those of the common deer. The colour of the hair in the summer coat is a dark brown, nearly black, particularly about the head. At this season the coat is short and glossy. In winter the animal is covered with long, coarse hair, of a brittle nature, and the colour is lighter in hue, a sort of grayish brown tinge prevailing on the sides, with the belly of a somewhat lighter colour. A tuft of hair nearly one foot long hangs under the jaws in the young moose. Moose is an Indian name, derived from the Algonquin word *mousse*, the eater.

I quote the following description from Billing's "Canadian Naturalist and Geologist":

"The gigantic horns of the moose are well known in almost every town in Europe or America where there is a museum. It is difficult to believe that these enormous solid appendages are the growth of a single season, and yet the fact is too well established to admit of a doubt. Only the males are provided with them, and no matter how large they may be, they grow to their full size in about twelve or fourteen weeks. On the young moose, one year old, they are merely short knobs; they increase in size after each annual shedding, and after the fourth year become palmated,

and may be termed full-grown about the fifth year. The palms are, on the widest part, on a moderate-sized male, about eleven inches wide. The space between the roots, six or seven inches. A very large pair measures over five feet between the tips, and will weigh sixty or seventy pounds. They begin to sprout in April and fall off in February. It is said that their growth is complete in August, when the velvet peels off, and they are then white, but afterwards become brown or yellow. From one to three points or short prongs are added to the palms each year, so that the age of the animal is not indicated by the number of these prongs, as is generally supposed.

"In fighting with each other they use both horns and feet, but in contending with dogs, only the latter, with which they strike tremendous blows. Their pace is a long swinging trot which they can keep up for several hours in succession."

A wounded moose is a very dangerous animal to approach, unprepared with the means of finishing him. From an eye witness, I was told of a case in point. A shantyman, I think on the Black River, at any rate at some place above Pembroke, ran out in sight of a number of his comrades close to the shanty, with a single-barreled muzzleloader and fired at and severely wounded a large bull moose. Seeing the animal wounded, he ran up to him with an empty gun, when the moose rushed at him, knocked him down with a blow of one of his fore feet; and before any of his friends could effectually interfere, the furious animal trampled and pounded the unfortunate man to death. I have also heard instances where hunters have been treed by wounded moose; and of one incident where a hunter escaped by dodging round a large tree until he was enabled to get a charge into his muzzleloader to administer the quietus. To shoot a moose in December, or in the middle of January, when he strides proudly along beneath the weight of his lordly crown, and when he is fat and heavy, is something that a sportsman may be proud of; but to slaughter the unfortunate animals in the latter end of February and March amid snow five feet deep, when the females are heavy with young, and the males are hornless and lean, is a species of assassin work which ought to be put a stop to by the strong arm of the law, if men are not ashamed of such improvident butchery.

The moose, which at one time was found in abundance in all the Northeastern States of America, at the present time "holds a precarious and short-leased existence," says Parker Gilmore, "in the northern portions of Maine." They are also, in decreasing numbers, however, still to be met with in Nova Scotia and New Brunswick. Although diminishing every year, they are comparatively plentiful on the north side of the Ottawa River throughout its entire length, and in some localities far west, on its southern side. In the country lying to the south of Jame's Bay and stretching west to Lake Winnipeg, "this giant deer can be found in greater abundance than in any other portion of the American continent." Mouse are also found in considerable numbers in the country bordering on the St. Lawrence below Quebec, particularly in the Labrador region.

Audubon says the moose grows to the height of twenty hands. Others who have made the subject a study, say that they grow even much larger than that. The moose of Labrador are smaller than those of the State of Maine or Canada, owing doubtless to the severe winter weather and the sparse vegetation of the former locality.

The moose, when captured young, is easily domesticated, and grows quite tame and docile; but the confinement of civilization does not seem to agree with them, and after a few years' confinement they pine away and die. With a park of sufficient size, well supplied with hardwood trees and swamp, and well watered, doubtless the animals would thrive. In a state of domestication the moose has been trained to harness, but he does not like it; but when he pleases to stretch out in a trot, the animal is exceedingly fleet. I have frequently seen the young bull moose owned by our late excellent Governor-General, the Marquis of Lorne, harnessed to a carriage; but, although he could be made to go at a pretty decent trot with a little touching up with a whip, he did not take kindly to the slavery, and sometimes used to lie down flat and stretch out his neck at full length, to show his repugnance to the idea of being turned into a horse, a transformation, however, scarcely possible in an animal so much resembling a gigantic ass. The male and female moose owned by Lord Lorne have been taken to the highlands of Scotland by him, and I have been sorry to hear that they are not doing well in their new home.

No member of the deer genus produces finer venison than does the moose. The flesh, although somewhat coarse in grain, is juicy, and has a fine gamy flavor; and the fat, which is abundant when the animal is in good condition, is beautifully clear and white. A delicacy which only the moose hunter can enjoy, is the marrow from the shank bones cooked immediately after the animal has been killed. I shall finish with the moose, with a quotation from Parker Gilmore. He says: "The Virginian deer, the fallow deer, the wapiti, and the red deer, are to me perfect in shape, graceful in their movements, and ornamental to the landscape; but the moose, on the other hand, with his short, thick neck, asinine head, protruding eyes, heavy, broad ears, tremendous antlers, long, awkward, powerful legs, and disproportionate withers, looking even higher than they are from the mane that surmounts them, can never be considered by an impartial judge, but an awkward and clumsy brute.

"Of all the ruminants on the American continent, the moose is the tallest. I doubt not a stall-fed ox can be made to weigh as heavy, but not to attain the stature; and on this continent, as well as others, it is really a duty that the legislatures of the various States and Provinces, of which he is an inhabitant, owe to the country at large, to pass and enforce such laws as will prevent his ultimate annihilation."

Before leaving the moose, I may mention that in any section of country in which the Virginian deer abound, moose are seldom found. It is said, and I believe truly, that the moose, large and powerful as he is, is unable to withstand the lithe and vigorous attack of the active and sharp-horned buck of the smaller species. In the fall of the year, under the natural impulses incidental to the season, desperate battles take place between the male moose. Such conflicts, however, rarely terminate so fatally as the struggles between the males of the lesser breed; the broad, blunt horns of the great elk not being so well adapted to the purpose of inflicting dangerous and fatal wounds as are the sharp-pointed antlers of the former. In like manner the red fox originally imported into the United States (then British colonies) by Sir Guy Carleton, exterminated the smaller native grey fox. The red squirrel, also, makes his hunting ground too hot for his larger and stronger congeneric brother of the black species.

[TO BE CONCLUDED.]

BIRD NOTES.

I HAVE been over the same grounds not less that half a dozen times since the day reported, and with about the same success. Two days later, in the evergreens, I saw a flock of about a dozen pine linnets (*Chrysomitris pinus*), the first I ever found here, and secured five specimens. A week after observation reported I saw just one snowbird (*Junco hyemalis*), and near by I found a field mouse impaled on a limb of a pear tree, but did not see his executioner, the great northern shrike. I was told by a friend who is better posted on birds than I am that he had seen a shrike in his yard a few days before. Since then I have visited the evergreens four times, and have not seen *Junco*, and came to the conclusion that he had shared the fate of the field mouse, as the latter was missing from the branch. To-day I went over the same route, passing through cornfields, potato patches and wheat fields, where I have always, until this winter, found snow buntings, horned larks and tree sparrows, and examined the weeds on which they feed, and only in the cornfield, where the weeds were best protected from the frost, did I find any seeds, and then but very little. When the weather permits, I always make such an excursion every Sunday afternoon, and always examine birds' nests in winter as well as summer. I reported only what I did and did not see. Probably no man in Lockport does more tramping about the country than I do. My business is such that I have many leisure hours, and I derive much pleasure in this way. I usually go alone and across lots. In a December number, I think, of the FOREST AND STREAM I read the report of the American Union in regard to bird migration, and offered my poor services to Dr. C. Hart Merriam to report observations from this vicinity, and they were cordially accepted. I have just made my report for February, and it was an exceedingly meagre one. I will inclose a copy, and if you think it of interest you can publish it.

Feb. 22 being a holiday, I was out from daylight until dark, and probably traveled from ten to twelve miles, and you will notice the observations were few and only three of them winter visitants.

The golden eagle reported was sent to my son to be mounted. I had never examined one before, and was very much surprised at the size of the body after being skinned, and I sent it to one of your correspondents to see if he could identify the bird. His reply was "that he could not be deceived by coloration—"the bird is all of one color"—"had no bird skeletons at hand for comparison and would give his opinion offhand"—and say of the bird—"h'its not an 'en, an 'awk nor a h'owl, but a h'eagle." It was an immature bird, and the body was no larger than a great horned owl my son skinned to-day. The feet of the eagle were full of porcupine quills, which was probably the last animal he had dined off and about as hot a meal as he ever had.

Birds seen at Lockport, N. Y., during February:

PERMANENT RESIDENTS (P. R.)

Feb. 22. Downy woodpecker—*P. pubescens.*
Feb. 26. Great horned owl—*Bubo virginianus.*

WINTER VISITANTS (W. V.)

Feb. 19. Pine linnet—*C. pinus.*
Feb. 22. Herring gull—*L. argentatus.*
Feb. 22. Black-capped chickadee—*P. atricapillus.*
Feb. 22. Tree sparrow—*S. monticola.*
Feb. 24. Snowbird—*J. hyemalis.*

TRANSIENT VISITANTS (T. V.)

Feb. 20. Wild geese—Heard them in the evening.

SUMMER RESIDENTS (S. R.)

Feb. 16. Robin—*Turdus migratorius.*
Feb. 22. Cedar waxing—*A. cedrorum.*
Feb. 22. American goldfinch—*C. tristis.*

Note.—The wild geese were reported to me from a competent party, a golden eagle (*Aquila canadensis*), was sent to my son to be mounted, from Plessis, Jefferson county, N. Y.

LOCKPORT, March 4. J. L. D.

During the past winter our most abundant bird, save always the black snowbird and tree sparrow, was the white-bellied nuthatch. Next to these were the cardinal grosbeaks and bluejays in about equal abundance. Numbers of the latter birds were trapped by the boys and sold in neighboring towns at twenty-five and fifty cents each. The following species were also rather abundant throughout the winter: The song sparrow, tufted titmouse, Carolina wren, American goldfinch, red-headed woodpecker, flicker and Carolina dove. I saw the bluebirds and a crow or two in January with the mercury at zero. The first general appearance of the crows was Feb. 4; that of the robins Feb. 11, and of the bluebirds Feb. 12.

Many of your correspondents have remarked about the unusual occurrence of certain birds, as the robin, blackbird, bluebird, meadow lark, snipe, etc., within their districts the past winter, and when the ground was covered with snow and the weather unusually severe. I believe it to be capable of explanation, and would assign as the indirect cause the very general and very extensive snowfalls in the month of January, almost without a parallel in our country. For nearly a week in that month, the ground was covered with from six to thirty inches of snow, from the Atllanic to the Mississippi, and from the Lakes to Georgia; and much the larger portion of all this vast territory was under snow during nearly the whole month of January. Now, it is well known that many of our birds, as those mentioned, are but partially migratory, and that the question of food supply is the chief factor in determining their winter habitation; hence it is the great bulk of them ordinarily are found wintering in the "Carolina" districts, where their food supplies are rarely cut off by snows. But during the period spoken of above, these districts being almost universally under snow, the birds, in seeking suitable feeding grounds, were necessarily more widely and generally dispersed, which to my mind sufficiently accounts for their appearance in certain more northern districts at the time, and under the circumstances, noted by your correspondents. REV. W. E. HILL.

FAIRVIEW, Hancock County, W. Va., March 3.

Since the last cold snap and snowstorm our birds have again made themselves scarce, excepting the plucky bluebird. Hawks have been unusually plentiful the past winter. In my last I wrote you I was expecting the ducks, but since then the cold put a stop to their coming, as everything is frozen. However, it will not be long before they will be here in full force. Quite a number of rabbits were left over from last fall's shoot, and I noticed a great many tracks in the snow lately. It's surprising how rabbits keep up their numbers, since they are constantly hunted in season by men and boys, and in summer by hounds and curs, and I can readily believe the dogs kill more rabbits, when they are young, than hunters. To-day is warm and spring-like once more, although enough snow has fallen to insure good sleigh riding. No one in these parts feeds or shelters quail; perhaps the quail are so scarce they can't find them. Some years ago quail were here in goodly numbers, but of late years it's pretty hard to find a bunch. Partridges are a bird of the past with us almost; one being found occasionally a few miles from here. 16-BORE.

MADISON, N. J.

I herewith send my mite of information concerning the appearance of our spring birds. I saw robins and bluebirds for the first time on Feb. 13; saw several meadow larks in January, but that is nothing unusual here; saw the first red-shouldered blackbirds about the 15th of February; also saw a few pintail, mallard and dusky ducks. The robins are here yet and seem inclined to stay. The others mentioned appear to come and go, according as the weather is warm or cold. I shot two specimens of what I called rusty grackle (*Scolecophagus ferrugineus*), but am not certain. Length, nine inches; color, head and neck of male black, shaded on tips of feathers with gray or russet, and traces of russet among the feathers on the shoulders; general color black changing to green. The female had a great deal more russet and gray on head, breast and shoulders; otherwise same as the male; iris light yellow; bill three-quarters of an inch in length. I never shot any birds like them before, and thought they were common blackbirds when I first saw them. Am I right in my conjectures or not, and is their appearance at this season of the year (February) anything unusual? S. E.

SEVILLE, Ohio, March 5.

[The birds mentioned by "S. E." were rusty grackles, as he supposed.]

There is deep snow on the ground here everywhere, and yet one of our taxidermists shot a meadow lark out of a flock of eight or ten March 5. Saw the bird and it was a beauty. The pine grosbeaks appear to have left for the most part. A flock of female and young purple finches have been here during the latter part of February.

AMHERST, Mass., March 7. W. A. STEARNS.

We have had a severe winter here. Snow covers the ground yet to the depth of several feet. Grouse and quail have about all disappeared within the last few years from these parts, owing to their wholesale destruction by pot-hunters and foxes. Pine grosbeaks have been quite numerous in the towns, feeding on the berries of the mountain ash. Rather an unusual number of crows have wintered here, considering the severity of the weather. A few shore larks and downy woodpeckers and a few solitary chickadees constitute our winter birds. CANUCK.

OSHAWA, Ontario, Can., March 10, 1884.

We have been visited since the 1st of February by a large number of pine grosbeaks, which enter our city without any fear, being very tame; indeed, a friend of mine caught one under his hat. The birds mostly are females and young birds. I have seen only one male in full plumage. Is not this queer? F. W. G.

HARTFORD, Conn., March 7.

CROWS.

A GERMAN friend related the other day a novel method of capturing crows, that was practiced in the "Old Country," when he was a boy. They sewed some strong horse hairs to the grains of corn, and tied them securely in a place the crows were wont to frequent. The crows would come and eat the corn without observing the hairs attached to it, and thus would be held fast, much against their will. It would doubtless be ludicrous, and perhaps a little pathetic to see some grave old sentinel give the warning signal, and endeavor to fly away as one approached, only to be held down in this ignoble manner. But it was very ludicrous and not at all pathetic to see our old friend (who ought to be sedate, as he has children grown) try to imitate them. He would jump, flop his arms, ca-wa-ik, ca-ca-rawk, ca-awk-aw, duck his head as though it were being held down by the bait, jump and flop until his head was drawn quite beneath him; then exhausted he would lift a very red face, which would grow redder with laughing at the remembrance. He said that he, with his brothers and sisters, owned a tame crow of which they were very fond; but one day while they were away, their mother saw it deliberately walk up and "spike" a gosling in the head, killing it instantly. This enraged the good "frau," who ran out and picking up a small stick, flung it at him; when, to her astonishment, the crow, with a faint caw, toppled over and expired.

She had her punishment, however, when the children returned and filled the house with wailings and lamentations, and could not be comforted for the loss of their pet. Papa W. had some fancy poultry in which he took great interest; but he found that the young chickens kept disappearing in a very unaccountable manner, until one day he discovered *Corvus frugivorus* flying away with one in his beak. A charge of shot put an end to his career, and after that there were no more missing chickens. VIOLET S. WILLIAMS.

CORALVILLE, Pa., March 4, 1884.

BULLETIN OF THE NATURAL HISTORY OF THE STATE OF MASSACHUSETTS.—We have received from Mr. W. A. Stearns a circular setting forth that it is proposed to establish under the above title a monthly periodical devoted to the natural history of Massachusetts. The periodical is to be published at Amherst, Mass., is to contain from twelve to sixteen pages, 6x9 inches, of brevier type. It will be conducted, we understand, by Mr. Stearns. Price is to be $1 per annum.

CURIOUS.—On March 6 a specimen of the mottled owl (*Scops asio*) was brought to me that had been killed by the person throwing a club at it. Upon dissecting it I found the stomach contained wheat, buckwheat and seeds, nothing else. This is the first instance that I have ever found grain in the stomach of an owl.—C. F. CARR (Waupaca, Wis., March 12.

EARLY BREEDING OF HORNED LARK.—For several weeks horned larks (*Eremophila alpestris*) have been with us, and some time since I noticed the males chasing each other as they are wont to do during pairing season. I paid no particular attention to the circumstance, as my earliest clutch of eggs were taken March 23, 1883 (the chicks were nearly ready to come forth). This morning a friend brought for identification a young bird he frightened from the nest yesterday, which proved to be a young male of the above mentioned species. How he managed to survive the late cold

wave is a mystery. Larks (*Sturnella magna*) robins (*Merula migratorius*) bluebirds (*Sialia sialis*) have been here since the first of the present month. Partridge (*Bonasa umbellus*) have wintered well, what few are left. Many were shot the past season, and reynard, who is an unmerciful pot-hunter, keeps up the slaughter the whole year through. I am glad to learn that some of the readers of the FOREST AND STREAM are awaking to the fact that a bounty on his head is the only way to save the birds from total extermination.—BAR LOCK (Virgil, N. Y., March 13).

Game Bag and Gun.

PROTECTING SONG BIRDS.

A BIRD never flutters unless it is hit. The taxidermists of Massachusetts have taken alarm at the proposed legislation giving the power to license them into the hands of the Fish and Game Commissioners. Heretofore any boy of sixteen years could obtain a certificate from the curator of the Museum of Comparative Zoölogy at Cambridge, the president of the Massachusetts Agricultural College at Amherst, the Boston Society of Natural History, the Worcester Lyceum and Natural History Society, the Peabody Academy of Science at Salem, or from any incorporated society of natural history or college in the State, and become a full-fledged ornithologist, with power to hunt and kill, and take the nests and eggs of as many birds as he could find. The effect of such a law has been disastrous to the birds of the State. Not only have the real taxidermists scoured woodland and field, but boys more in love with killing something than with any sort of study, have been let loose with a certificate in their pockets and a gun in their hands, till the song and insectivorous birds we loved so well in boyhood have begun to disappear.

A lady of Taunton, Mass., writes the Fish and Game Protective Association a letter of congratulation that something is at last to be done to stop the destruction of our native birds under the name of science. She remarks the rapid decrease of the more common birds during the past three or four years in her immediate vicinity, and easily traces their skins into the taxidermist's shop, and, worse than all, their eggs into the collections of pretended young students of ornithology. The lady is able to point out a number of such collections in her immediate neighborhood—eggshells enough to have made the birds scarce in any tract of country from which they were taken. She very aptly illustrates the real state of the case when she shows how a boy thirty or forty years ago would have been reproved by his mother with tears in her eyes for taking a single bird's nest or egg, and have perhaps received a whipping from his father. But to-day the boy's collection of a few badly mounted bird skins and hundreds of eggshells is put into the mother's best parlor, labelled "Ornithology," often badly spelled and worse written, and the mother points out the collection with pride when visitors call, with a look which says, "See how much our boy knows." Perhaps the young ornithologist, at the very moment, is behind the woodshed reading Indian stories in a dime novel.

When we remember the earnest researches of Wilson and Audubon, the many days of patient study they devoted to live birds, and take into account what true and devoted bird study has already given us, really such pursuit of ornithology as the lady reader mentions looks tame and ridiculous. The institutions of learning which have granted thousands of certificates to boys to follow out so false a line of study have not done a work to be proud of.

But the taxidermists of the trade have taken alarm, and the Legislature is being besieged with communications, and members are being interviewed and urged to vote down any bill which shall interfere with the study of bird science. A member of the Legislature made a good reply the other day to one of these lobbyists.

"Well," said he, "you want the law to stand as it is?"

"Yes; the law is good enough."

"You want to kill birds and take their eggs, in order to study them, don't you?"

"Yes, sir; we are obliged to have collections of dead and mounted birds in our study of ornithology."

"Well, perhaps you are right; but would you expect a traveler, sent out to a far country to study the habits of the people, to take a shotgun with him and kill and stuff the skins of all the people he could find? He would come back with a full knowledge of the habits and customs of the people, wouldn't he?"

The taxidermists retreated from the force of such reasoning. X.

THE OLD GUN.

ONE of my neighbors, a few years ago, showed me a big 10-bore flint-lock gun, which, in the hands of his ancestors, had done some tall duck shooting. They used to run their own shot in a mould with sixteen chambers, and used flax tow for wadding. To overcome the recoil they wore a pad on the shoulder, and fired heavy charges. It was used for a training gun in the old militia days.

Finally, one day I told him if he would let me target it I would buy it. I don't shoot flint locks since I fired one a number of years ago at a flock of blackbirds up in the elms and singed my winkers by the pan powder; but I have a vise in my shop that holds them and a hot iron sends them off. After making a few trials that way I found that the old gun stood by its record, and the result was a trade. I had a government percussion fixed on and the very first shot that I had at ducks I got four mallards. The paced distance was between nine and ten rods. I think the best target shot I have made with it was when it had been loaded for a while and was somewhat rusty in the muzzle. At eight rods it put four center large shot inside of a two-inch ring, the rest a good pattern. Query—Did the slight rust act as choke? if so, what is the best choke for heavy shot?

I have since taken off the heavy brass heel plate, crooked the stock, shortened stock under barrel, and cut off six inches of the barrel, and it makes a handy, reliable gun that we can turn round on an ordinary sized lot. The original length of barrel was 3 feet 6 inches. There are two crowns struck on the barrel near the breech, and Amsterdam is plainly lettered on the lock plate.

Such is a brief history of the old gun that has brought many a duck and gray squirrel to hand since I bought it.

I will write some time how to crook a gun stock to make quick sighting and have the stock strong.

COUNTRY.

GLASTONBURY, CONN.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

Like "Backwoods," in your journal of Feb. 28, 1884, I am "tempted to put in my oar" on the "performance of shotguns."

We will premise by saying that no sized bore, no length or weight of gun, no amount of powder, nor any charge of any sized shot can be made to attain a greater initial velocity than about 2,000 feet per second; that with a given charge of powder, the velocity falls off as the weight of shot is increased; that as great an initial velocity can be attained with a 20-gauge as with a 4, or 6, 8, 10 or 12-gauge gun; that a 4, 6, or 8-gauge weighing 10 to 20 pounds can project shot of the same size no further, or attain to any greater initial velocity than one of 12, 16, or 20-gauge weighing 7 to 8 or 9 pounds.

If these assumptions be true, it only remains for us to find out the quantity of powder, quantity and size of shot, and that medium of weight and gauge of gun that will handle the easiest, and that will kill the game we are after the best.

This will bring you to repeated trials to test the "performance of shotguns."

In these "tests" something like the following may be found to be true, and aid in making choice of the gun we are looking for:

TEST OF DIFFERENT CHARGES OF POWDER.

12-Gauge Gun—40 Yards.

Charge.		Pattern.		Force.		Recoil in Lbs.	
Powder No. 1.	Shot No. 7.	R.	L.	R.	L.	R.	L.
3drms.	1⅛oz.	126	170	12⅛	13⅜	87	86
3½drms.	same.	147	170	14⅛	14⅛	92	90
4drms.	same.	131	170	15¼	16	96	93
4½drms.	same.	117	172	16⅜	16⅜	100	100

10-Gauge Gun—40 Yards.

Charge.		Pattern.		Force.		Recoil.	
Powder No. 1.*	Shot No. 7.	R.	L.	R.	L.	R.	L.
4drms.	1¼oz.	156	200	14⅛	15	94	95
4½drms.	same.	146	170	15	15⅛	98	100
5drms.	same.	157	191	16	16¼	10⅜	103
5½drms.	same.	140	208	16	16	105	105

* Oriental powder is numbered No. 1 fine to No. 4 coarse.

TEST OF DIFFERENT SIZES OF POWDER.

12-Gauge Gun—40 Yards.

Charge.		Pattern.		Force.		Recoil.	
Powder, 4 drs.	Shot, No. 7.	R.	L.	R.	L.	R.	L.
No. 1.	1⅛oz.	134	170	15¼	16	96	94⅛
No. 2.	same.	135	167	14⅛	14⅜	91	87
No. 3.	same.	152	194	14	13⅞	90	88⅜

10-Gauge—40 Yards.

Charge.		Pattern.		Force.		Recoil.	
Powder, 4½ drs.	Shot, No. 7.	R.	L.	R.	L.	R.	L.
No. 1.	1¼oz.	146	170	15	15⅛	98	99
No. 2.	same.	139	181	14⅛	14	95	90
No 3.	same.	157	210	13	13⅛	91	90⅜

TEST OF DIFFERENT CHARGES OF SHOT.

12-Gauge Gun—40 Yards.

Charge.		Pattern.		Force.		Recoil.	
Powder, No. 1.	Shot, No. 7.	R.	L.	R.	L.	R.	L.
3½drms.	1oz.	125	160	15⅜	16	84	85
same.	1¼oz.	127	174	14⅛	14⅛	89⅜	89

10-Gauge Gun—40 Yards.

Charge.		Pattern.		Force.		Recoil.	
Powder, No. 1.	Shot, No. 7.	R.	L.	R.	L.	R.	L.
4½drms.	1oz.	149	154	17⅛	18	90⅛	90
same.	1⅛oz.	133	149	16⅛	16⅜	91⅛	92
same.	1⅛oz.	175	191	15⅛	15⅜	90⅜	100

6-Gauge Gun—40 Yards.

Charge.		Pattern.	Force.	Recoil.
Powder, No. 1.	Shot, No. 7.	One Barrel.	One Barrel.	One Barrel.
5drms.	1¼oz.	287	14 1-6	117
same.	2⅛oz.	551	12½	125

Each test given above is the average of six shots with Oriental powder.

Suppose an initial velocity of 2,000 feet per second can be attained, then No. 7 shot in any gun will be projected up 206.71 yards, or 37.58 rods, in 3½ seconds of time; No. 8 shot, 176.20 yards, or 32 rods, in 3.27 seconds; No. 5 shot, 234.45 yards, or 42.63 rods, in 3.85 seconds; No. 3 shot, 268.10 yards, or 48.75 rods, in 4.17 seconds.

It is not claimed that all guns of the same gauge, loaded with the same charge, fired at the same distance, will produce exactly the same pattern, but it will be found that the force or penetration will be substantially the same, because the initial velocity will be substantially the same.

The variation in the pattern and force of guns of the same gauge will arise from the quantity and size of the powder used in loading, the quantity and size of shot and, to some extent, the manner of loading when fired at the same distance, and the choke of the bore. For instance: A 10-gauge gun charged with 5 drams of powder (No. 2 Oriental) and 1 ounce shot, the initial velocity will be very near 1,817 feet per second; with 1⅛ ounces shot, 1,716 feet per second; with 1¼ ounces shot, 1,628 feet per second; with 1⅜ ounces shot, 1,550 feet per second; with 1½ ounces shot, 1,482 feet per second.

All the tests show that an increased quantity of shot will give a better pattern, at medium range, say 40 yards, but it will be at the sacrifice of force or penetration.

The large gauges will carry more shot, be more likely to hit, while the force will be about the same as in smaller gauges, and at short range will be more liable to kill; as the impact of ten shot hitting a bird the size of a ruffed grouse would knock the life out of it without a single shot penetrating a vital part, while one, two or three shot at much greater velocity might go through the bird, and yet it might not fall until it had flown out of sight.

In the light of these facts which I have only touched upon without elaboration, it seems pretty clear to me that the days of heavy guns and big bores are about numbered. That in choosing a gun for ease in handling, for pattern and penetration, for economy in loading, and convenience in the field, a 30-inch, 8¼ to 8½, 10-gauge breechloading double-barreled shotgun loaded with 4¼ drams No. 1 and 3 powder (mixed half and half) with two pink-edged wads over the powder, and 1¼ ounces shot, one wad over shot, will be found such a medium as to answer all reasonable purposes, and give daily and increasing satisfaction. Next to it a 12-gauge, 30-inch, 7¾ to 8¼ pounds, double-barreled breechloader, especially for field shooting will be found adequate, and a great favorite where one can afford to keep two guns. Load, 3 to 3½ drams powder No. 1, and 1 ounce shot.

As to the choice between the muzzle and the breechloader I can only say "there is no accounting for tastes." For thirty years I owned and shot two muzzleloaders, which I then thought were good guns. When breechloaders came and were thoroughly tested, I gave one of them away and had the other altered over into a breechloader, and have it yet.

It is my opinion that there is but little difference in the force or penetration between them. But in pattern and convenience there is a wide difference, especially if the breechloader be choked and metallic shells are used. With metallic shells wads over the powder can be used two sizes larger than the gauge of the gun. This enables you to get the same initial velocity, and consequently the same force or penetration that you can possibly get from the muzzleloader, while the choke in the breechloader, which you cannot have in the muzzleloader, will most certainly give uniformly the best pattern. But suppose their penetration and pattern were equal, would not the muzzleloader have to yield to the greater convenience and rapidity of loading of the breechloader? D. W. C.

CLEVELAND, O., March, 1884.

Editor Forest and Stream:

My experience with, and opinion of breechloading shotguns, is about as follows: I own a 12-bore, 28-inch, 8¼-pound chokebored Colt gun. The tag which came with the gun said, "3 drams Hazard powder, 1¼ ounces No. 8 shot, 2 pink-edge wads over powder, 1 over shot, for paper shells same size as shell, and for brass shells 2 sizes larger;" while the pattern given was "298 right barrel, and 302 left barrel, 40 yards, 30-inch circle, No. 8 shot." Result of test. Made a score of paper targets, 30-inch circle, loaded brass shells, 2⅞ inches long, as directed, and the best pattern was about 250. Then tried paper shells with about the same result, which was not satisfactory, as the gun was "warranted to make pattern on tag." Had been using Winchester pink-edge wads, and slow-burning powder. Was told to get finer powder, and Eley's pink-edge wads. Procured some FFG dead shot powder, and Eley's wads, and paper shells 2⅞ inches long—length of chamber in barrel—and the result was a pattern of 324, with 3 drams of the fine powder. This result was quite pleasing, in fact very satisfactory; but I concluded to do a little better if possible. Procured cardboard wads to use over shot, with the brass star wad which banishes crimping and holds the cardboard wad securely, and tried again. Eureka! count up 424 in 30-inch circle, 36 in 6-inch circle, and 11 in 3-inch bullseye. Good enough. Try same charge, 3 drams, wood powder, about 300; increase the charge to 4 drams, and over 400 again. At 100 measured yards with 4 drams of quick, strong powder, 1¼ ounces No. 4 shot, can stick in a pine board from 1 to 5 shot in a 6-inch circle every time. Cannot do it with wood powder, the shot will dent but will not stick. As to penetration, that must follow a good pattern, the two are inseparable.

Conclusion of the whole matter: A 12-bore, chokebored, 28-inch gun, loaded with a shell length of chamber, 3 drams strong, quick, black powder, 1¼ ounces No. 8 shot, 2 Eley's pink-edge wads over powder, cardboard and star wad over shot, will put over 400 pellets in a 30-inch circle at 40 measured yards. Probably a 10-bore would do better still. This whole question hinges on one essential point—loading. The best chokebored gun now made, if improperly loaded, will give unsatisfactory results. NEXT.

NEW MARKET, N. H.

Editor Forest and Stream:

In your issue of March 6, 1884, I notice a communication from "Hammerless," in which he says: "Tell your correspondent "Octo" that if his gun will average 440 out of a counted charge of 500, I will give him five times as much as he paid for his gun."

I would not feel called upon to answer "Hammerless" concerning this extremely liberal offer on his part, except that in other parts of his interesting article he seems, and I believe with good reason, to condemn the want of uniformity in targeting guns; and I do not want to appear among those who "heap" the measure and use "trap shot" also, or who shoot at a range of 35 yards and call it 37 or 40, or who have "guides" to direct the scattering pellets to the target. If "Hammerless" will examine the squib "I wrote in the issue of Feb. 21," he will discover that it reads as follows: "In answer to his (Buckeye's) inquiry as to the proper performance of a good breechloader, I would say that at 40 yards, with 1¼ ounces of No. 8 shot (Tatham's 400 to the ounce) and five drams of powder, *a good 10-gauge gun should put from* 375 *to* 440 *pellets* in a 30-inch circle," etc. The italics are mine. "Hammerless" will notice that I do not even claim to own a gun at all, nor do I claim that even a *good* gun will *average* 440 pellets with the charge and range given. Not wishing to arouse the ire of "Hammerless" at

all, nor to enter into any controversy with him, I merely write this to put myself right before your readers. I propose, in a few days, to do some experimenting with different charges and manner of loading shells, and if of sufficient interest, will send you an account of the same. OCTO.

JOHNSTOWN, Pa., March 7, 1884.

Editor Forest and Stream:

I have owned nine different breechloading shotguns in the past ten years, made by various firms, and ranging from 7 pounds to 11 pounds in weight, and from 14 to 10-gauge, with length of barrels from 28 inches to 32 inches. My present guns are 8 pounds hammerless, and 10 pounds cheaper grade of English gun. I think I am pretty well "fixed" now for guns. Both my guns are 10-bore, and I prefer to have them alike on account of ammunition. I have spent a great deal of time and some money in testing these different guns with varying loads. By nailing on the side of a shed a package of large wrapping paper, and at forty yards, firing at the paper, in this way I get distribution and penetration.

It may surprise some of your readers when I tell them that a 14-bore, 30 inch length of barrel, Greener gun, has the best record for penetration of any gun I ever used, and I will surprise them further by saying that there is a muzzle-loading gun owned here which could be bought for twenty dollars, I think, that, after what I saw it do in the way of game killing at long distance, I would no more think of shooting either of my guns against it than I would of loading one of them with ball and shooting it against a rifle. In my opinion, the gun makers will have to manufacture their breechloaders with a different kind of point at the breech from what is now used before they can make guns of equal weight to carry shot with those loaded at the muzzle. STRAIGHT HAND.

Editor Forest and Stream:

I have been much interested in the "Performance of Shotguns." I once tried the very experiment suggested by "California." I had just received a —— B. L., 12-gauge, 8½ pounds' weight, of which I had dreamed and thought for some three months. In my haste to test the gun I forgot to take the powder charges from the store, and so loaded (with the advice of a friend [?]) by guess. I wondered the shells were made so short, as I had difficulty in squeezing the last wad in. However, I started out and fired at a mark. A government mule couldn't have kicked harder than that gun. I fired again at a strawberry box at seventy paces. This time "the retreat partook of the nature of a panic," but I hit the box. A friend happening along with a flask having a charger on top, I unloaded and measured my charges. I had loaded with 6 drams of powder and 1½ ounces of shot. His measure was, perhaps, not accurate, but was probably as much so as the general run of measures. I have since experimented a little, but never could obtain the wonderful targets I have seen made—on paper. I now use 3 drams of coarse powder and 1 ounce of shot, and the gun performs perfectly satisfactorily. I believe with careful loading I can, by shooting 3 drams of powder and 1⅛ ounces of shot, place 240 pellets in a 30-inch circle at 40 yards. And, by the way, I would like to ask if "L. H. H." is always as original as in his last communication. It seems to me I have read the same opinion, expressed in the identical words, in "Hallock's Gazetteer." It may be only a remarkable coincidence, though. SIALIA.

BRADFORD, Pa., March 7.

Editor Forest and Stream:

I would be pleased if there were some one among your readers who will answer the following: I have a breechloading gun .12-80-7¾ that will put 175 No. 8 shot in a 24-inch circle at 45 yards, using 1¼ ounces Le Roy shot. What I wish to know is this: Is that a good shooting gun, and how does it compare with a "full choke?" I have no trouble in killing game with it, and have cut down a ruffed grouse at 57 yards, and a rabbit at 61 yards, yet persons have seen it shoot and do not call it a good one, still they won't shoot their muzzleloaders against it. Also, I have seen on paper targets away ahead of mine so that I had begun to think my gun was only ordinary.

We have plenty of ruffed grouse, and rabbits or hares, and our fall shooting was very good. One party of fox hunters, Hearty Farrar and Will Dyer, have killed sixty-five foxes in front of their hounds, and did it with .12-80-8 breechloading guns, and they rarely had a fox get away. In this section the old muzzleloader is gradually giving place to the new breechloader, and the best makes have shown their ability to hold the place they have taken.

"D. H. S.," in your last issue, may rest assured his gun can't be excelled, because, when a gun puts 53 more shot in the target than there is in the gun, I do not think it can be improved, and at 40 yards the gun puts 148 more shot in the target than there is in the gun. I used Tatham & Brother's table to find number of shot in an ounce, and of No. 3 shot it is 106.

Perhaps "D. H. S." was mistaken, if so, will he explain. SNIP SNAP.

VERMONT.

Editor Forest and Stream:

In your issue of March 6, your correspondent "D. H. S." inquires if his target as published can be excelled. Well I should say not; when a gun loaded 1¼ ounces of shot that weighs 106 pellets to the ounce (No. 3) puts into a target 280, why I don't know of any way of bettering it, as according to my figuring there would be but 133 pellets in the charge. If "D. H. S." has that kind of gun, I know a man that wants to buy it. A friend of mine in the hardware business here who is an enthusiastic sportsman and has handled guns in his business for years, says tell that gentleman that he has a fine Colt gun, a red Irish setter and a small farm to trade for such a gun. If "D. H. S." had said No. 8 instead of No. 3 his target would have seemed a little nearer my idea of a first-class performance of a first-class gun.

Now a word of information for "Backwoods." In my opinion a 12-gauge, 30 inch, of from 7½ to 9 pounds weight, is as good a style of gun as can be used for all general purposes, and a gun that will cut down a quail at forty yards every time if properly held will be found to be about as good a shooter as is necessary, or as is likely to be found. All this talk about shooting game at extraordinary distances is all fudge. Of course any gun of good shooting qualities will kill occasionally at long ranges, but to demand that a gun shall perform miracles, is unjust to the maker, and will probably result in disappointment to the shooter. If "Backwoods" wants a gun for general use on all kinds of game, I think one such as I have described will suit him, and for my own part I should prefer one of American manufacture, as in case of accident broken parts can be more readily replaced. I have a light gun that I can feel pretty certain of doing a quail justice with at from 30 to 40 yards, if I hold on the bird, but should not expect to kill many at 60 or 70 yards. It will shoot heavy shot hard enough at 80 yards to go through a duck, but the next thing is to hit said duck; possibly by shooting at a large flock, some might be killed, but I consider such ranges beyond the scope of a shotgun, and would not advise any one to strain himself or his gun in attempting impossible feats. CHIPPEWA.

SEVILLE, O., March 10.

Editor Forest and Stream:

Referring to "California" in issue of 6th inst., under the head of "The Performance of Shotguns," if you want to ascertain the true inwardness of your barrels when clean, look through them, and if you find the circles true, and that they fit each other like the joints of a telescope, *i. e.*, the lines equal distances from each other all round, your gun is "as straight as a gun barrel" if otherwise you know something is wrong. This wrinkle, perhaps, the makers may not thank me for. Take any of the cheap shop guns, and depend on it you won't find the circles as above in one among a thousand. Try it for yourself. R. P. I.

PICTON, Canada, March 9.

Editor Forest and Stream:

I think the idea in regard to properly loading shells, suggested by you, a good one, and if any one has a better way than mine I shall be very glad to know what it is I am ready to try any plan that promises to be any improvement. I use an 8¾-pound gun 12-gauge, 30-inch barrels, modified choke, chambered to take 2½-inch shells. I use two felt wads on powder, and one (felt) on shot.

A. E. B.

DODGE CENTER, Minn.

Editor Forest and Stream:

Will you ask "D. H. S." what make of No. 3 shot contains 185 pellets to the 1¼ ounce? Saying nothing of the "280" as mentioned by him in issue of March 6.

Also please tell "Ogeechee," Feb. 21, if he has a gun that with 1 dram powder and 13 buckshot kills bucks 120 yards, and wishes to know about having something done to the barrels, I should say—don't. REVIEW.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

I have agreed with some of the letters on "The Choice of Hunting Rifles" which have appeared in FOREST AND STREAM, and with some I have not, but I like to know every one's opinion in regard to the matter, and therefore will give mine. It seems to me that with as many different rifles as are now being manufactured in the world, all ought to be suited. Just step into a gun store and there you can find everything in the shape of firearms. What will suit one will not another, and you may take the best rifle ever made and somebody will find fault with it; but let us be content with what we can find in the rifles already made.

But now comes the tug. Some like repeaters best and some prefer the singleloader. I have used for the past twelve years a single breechloading rifle for all kinds of game, from a deer down to a little red squirrel, the size being .44-caliber, 48 grains powder, 240 grains lead and 30-inch barrel, central fire. I can take the head off of a ruffed grouse every time, and for all kinds of game shooting such as we have down in old Maine I would not exchange for any repeater that I have yet seen. The .44-40 and .45-60 repeater seems to be the leading rifle among sportsmen just now, but there are points about it that I do not like, not saying a word against its accuracy, for no doubt all repeaters will shoot as fine as any kind of breechloader.

In the first place, I want a gun that after using I can pass a cleaning rod (I prefer one made of wood to all patent ones) through from the breech, and then have a good chance to look through the barrel and see when it is clean; and I don't like so much machinery to keep watch of. It gets out of order and does not always work just right. This I have seen take place with the Winchester in trying to show how quick an empty shell could be thrown out and a full cartridge placed in the chamber ready to fire. In regard to rapidity of fire, I think that any of the single breechloading rifles now in use are safer, and will do their work plenty quick enough to answer all general purposes. For a hunter that is easily excited I suppose the magazine rifle would be better, for when they see a deer they will not stop to take a decent aim, but bang away three or four shots at him, and then when found, they will find only one bullet hole in the carcass. Every one for his fancy, but I do not think we Down-Easters will need a .40-90 repeater, as we are not troubled with the grizzly or any of the other large ferocious beasts of the West. SINGLE LOADER.

MACHIAS, Me., March 10.

Editor Forest and Stream:

In your issue of the 6th inst., I find a letter from "J. L. DeH.," who is traversing ground I attempted to explore some fifteen years ago, and on having a preliminary examination made at the Patent Office, I found that earlier inventions had been there and one Gen. Cochrane of New York had patented the same thing, only he had arranged it for rifle balls, where it was not so much needed, and my experiments were with the shotgun alone.

In the experiments I made with various proportion of inner tube, I found a tube of 20 per cent. area of shell to give the best results, and the results were remarkable. Using in a 12-gauge gun, 5 drams powder and 1¼ ounces of shot, I found the recoil lessened greatly, the report changed to nearly that of a rifle, the pattern doubled, and the penetration increased 50 per cent. This was the mean of five charges from shells with inner tubes and five charges from plain shells, fired from the same barrel.

On finding my way stopped by a patent I tried to reach the same results in another way, but could not equal the results given by the shells with the tube in them.

In the latter plan, I used No. 7 Laflin & Rand OL in the first half of the charge, and No. 3 Laflin & Rand OL for the last part, using stiff cardboard and one thick felt wad over powder, and as thin cardboard over the shot as I could work there. I have used this method for years for duck shooting and am satisfied that the increased velocity and pattern of shot pays for the trouble in using two grades of powder. ING.

CANTON, Ohio.

Editor Forest and Stream:

I have been much instructed in the correspondence in the FOREST AND STREAM relating to the choice of hunting rifles. What is applicable for hunting rifles I presume will in a measure answer for target rifles. I cannot understand in all this correspondence why such a heavy charge of powder is required to do effective shooting at short range. I belong to a club of amateur marksmen who meet occasionally for recreation, and while none of our number have had much experience on the range with a rifle, and are as yet poor rifle shots, we still sometimes manage to do very fair shooting with charges much less than stated by nearly all your writers.

I use a 32-caliber rim-fire Remington rifle, and find since I have been using this make my scores have shown a very decided improvement, even with a small charge of powder. Our range is 200 yards, and we use the Union cartridge, .32 long.

Some time ago I was at the range, and running out of the .32 long, I used the .32 short at the same elevation, and made four, with an occasional five, every shot, there being no apparent difference in the score. I have seen thousands of the Union cartridges used (we have discarded all others), and have never had but one that did not explode at the first trial.

To test the rifle and the cartridge, I measured off 166 feet, and using the Union .32 short, rim fire, open sight, Remington rifle, off-hand, I placed ten consecutive shots (without any sighting or preliminary shots) within a circle less than four inches in diameter.

This might not be any "great shakes" for an experienced rifleman, but for an amateur like myself, I felt highly encouraged at making a score of 45 out of a possible 50 without the use of any improved sights, and with a charge of powder so much less than is generally used. PASSYUNK.

PHILADELPHIA, March 11.

Editor Forest and Stream:

Have carefully read communications as to "best hunting rifles," "shotguns," "express rifles," etc., and of this last allow me to say there is not a genuine express rifle made in this country (my opinion). JOHN BOYDEN.

CHATHAM, Mass., March 9.

A PLEA FOR OLD-TIME CRUDITIES.

Editor Forest and Stream:

The average reader of the hunting rifle discussion is in a maze of perplexity; for what are these desolating arms wanted? Not for purposes of war, for the country is at peace, and if she were not, with dynamite bombs exploding at the distance of five miles, and the hidden torpedo connected with electric wires, small arms, shooting bullets, need no improvements—leaving out the humanity of the thing, for in these civilized days a foe placed *hors de combat* is as good as a dead man.

Surely increased destructiveness is not wanted to kill game, for the only formidable animal in America is the grizzly bear; and from the interesting and instructive letters in the FOREST AND STREAM from sportsmen who have traversed the frontiers of the far West, and the gorges and defiles of the Rockies in search of big game, we draw the conclusion the grizzly is scarce, and hiding in the thickest chapparals; so that it is a task of infinite trouble and patience to ever come across them. One of your correspondents wrote that for years he has hunted for the *Ursus horribiles*, and ridden thousands of miles in the wild West, and has never caught a glimpse of one yet.

I hazard the assertion that any sportsman who wants a more deadly weapon than the modern breechloading rifle to meet the grizzly bear or any other animal in a fair fight, is a timid sportsman, to say the least of it. I have had no experience with dangerous game, my sole shooting being wild cattle, with a Winchester of 1876 model, but what I saw of the terrible results of the bullets showed me as plain as day, that a ball with a velocity of 1,500 feet a second striking any animal, crushes its way with such instantaneous force that it paralyzes the brute for a second or two, which gives ample time for the shooter to pump in another shell and fire. He who could not save himself from any beast with his fifteen shots, well deserves to die the death.

A cool, brave man, with a modern repeating magazine rifle, could face with safety any animal that ever walked the earth. The royal Bengal tiger, the African lion, the horned rhinoceros, the Indian elephant, nay the great mastodon itself would stand no earthly chance against a rain of balls that crushed through bone, muscle and flesh at every two or three seconds.

Look at that king of sportsmen, Gordon Cummins, who confronted in their jungles the lordly lion, and the huge elephants, with nothing in his hands but a double barreled rifle; and yet while he counted his trophies by the score, here are so-called sportsmen of the day, who, with firearms so improved, that science and art have reached their limit, are crying out for a more deadly weapon, something that will conduce to more destructive results.

The truth of the case is, that the very perfection of firearms has been a curse to this country. The more destructive the sporting weapon becomes, the scarcer the game. Had human ingenuity stopped at the muzzleloading shotgun and rifle, the plains of the West would be filled with buffalo and deer to-day, and the Atlantic coast alive with wildfowl.

The selfish race of to-day seem to desire to leave nothing for their posterity in the sporting line except the mounted antlers of the stag they killed, or the buffalo or deer robe that they were once so proud of. Fifty years from now—nay in twenty-five—there will be no shooting in this country except in favored localities held by private clubs. And the breechloader is the cause.

There are some sybaritic sportsmen—God save the mark—who love to witness the dying agonies of the game without the trouble or danger of hunting it. These men would shoot all day in a herd of buffalo, and joy in seeing the staggering form sink to earth. The more the merrier. Like the brutal populace of Spain, their pleasure is not in the final triumph of skill, patience and marksmanship, against brute cunning, instinct and wildness; but rather the delight of seeing the pouring red blood gush out fresh from the heart, crimsoning all around.

These are the class who would have a grand battue if possible, and kill, kill, kill, until not a beast of the field or bird of the air was left alive.

I expect to live to see the period when some of these sportsmen will have a battery of doublebarreled guns covering the decoys, and they a mile off in a warmly heated room with an electric wire in their hands connected with the triggers and a spy glass to their eyes, will touch off the battery, and annihilate a flock at each discharge.

With breechloading shotguns, from No. 16 to No. 4, that can be loaded and shot five hundred times an hour; with repeating rifles carrying explosive bullets that can be fired fifty-

two times a minute (see Greener, "The Gun"), there are yet men who crave something that will give still greater odds to the slayer and reduce the chance of any game escaping with its life to a minimum.

Personally, perforce, I keep up to the times and have two high-priced English breechloaders and a small armory of rifles. Yet with all my heart I wish we could go back a half a century, and return to the old muzzleloader that gave fur and feather a fair chance of life, and would not destroy everything that runs and flies in a few brief years, and force us for the balance of our lives to hang up our guns and sigh for the sport of our youth.

Another correspondent, signing himself "Dorkin," says he don't like a gun with hammers, and gives the following astounding reasons: That the hammers slip from cold thumbs; they spoil canvas covers by the chafing; bark one's knuckles on the hammers, and—oh, shades of Nimrod!—get the whistle cord and watch chain snarled up with the same.

Many an old sportsman will grin on reading this, and picture in their mind's eye "Dorkin," gotten up regardless of expense, clad in new corduroy, with embroidered whistle cord, to which is attached a silver whistle, and a big watch chain hanging pendant on the outside of his coat.

That puts me in mind of a dude sportsman I saw down at Cobb's Island about ten years ago. All the girls gathered on the porch to see him off. His valet had to get a cart to carry his traps down to the landing, where a boat lay, with Warren Cobb as commander, to carry him snipe shooting.

Arriving at the blind just off Wreck Island, Warren set the decoys, and if the sportsman was not made comfortable, it was not the valet's fault. A large camp chair was placed within the blind, and then the valet held an umbrella over his master's head to keep off the torrid rays of the August sun, and actually fanned him as the heat grew more intense. A big block of ice had been brought along, and with it a half a dozen bottles of champagne, a few of beer and a quantity of old rye, and then the fun commenced. A few young birds came up to the decoys, in spite of the strange appearance, and Warren Cobb swears that after the sportsman fired he would hand his gun to his Jeems Yellowplush to be reloaded; and, said Warren, "Bust my breeches if we didn't have a drink around over every bird that he kilt. And when the water riz and come on the blind, he makes me take him on my back and carry him to the boat, and then pack out for home."

The party must have had a high old time, for long after nightfall the trio got back, every one of them three sheets in the wind; and the spoils were only ten snipe.

The prospect for partridges in this State is, as far as I can learn, quite a good one, the birds standing the winter very well. The Virginia Legislature has passed several good laws relating to game protection, which, it is to be hoped, will have its effect. Still, no legislative enactments can keep the game from steadily decreasing; and it is a sad, yet a true fact, that every sportsman can bear witness to as regards the Old Dominion. CHASSEUR.

VIRGINIA.

SPRING SHOOTING AT ST. CLAIR FLATS.

LAST night a thunder storm swept over Detroit. To-day a southerly wind prevailed, and there are other signs that the long winter is finally approaching its end. Within a few days the first flights of ducks from the south will reach Lake Erie, the Detroit River and Lake St. Clair. Already a few pioneers have been seen passing up the river. And the duck hunters, who have no scruples against spring shooting, are getting their traps together, loading shells, and making arrangements for a sojourn at their favorite ducking resorts. Several well-known shots start on the morrow to take advantage of the first flights, and scores of other sportsmen will soon follow to the various club houses at St. Clair Flats and along Lake Erie.

Did you ever do any spring shooting? No! Well you have missed some rare sport. We won't argue as to its being the correct thing as respects the preservation of game; but it is legal in this State, and is intensely exciting.

Splendid duck shooting at this season of the year is to be had in the vicinity of the Lake St. Clair Fishing and Shooting Club's house, at the Flats. It is better at that point in the spring than in the fall. For the house is accessible only by water, and as navigation will not open for several weeks, one must journey over the ice on Lake St. Clair from New Baltimore to the club house, a distance of at least ten miles. Not many sportsmen care to do this, so the number shooting there in the spring is insignificant when compared with the army of guns in the fall.

If the weather be soft, the trip over the ice from New Baltimore is oftimes fraught with danger, and a flat bottom boat shod with runners, so that it can be pushed over the ice, is necessary for safety. But once at the club house, any one will be amply repaid for his arduous journey, and especially if there in time to meet the first flights of the ducks. For, when they usually commence, the ice is strong and the air holes are small, so, if you select an air hole of the right size, there is no chance for the ducks to decoy or drop down just out of range. They come right over the hole; and oftentimes you can shoot and kill them over the further edge of the open water from your blind.

It may be said that there are three flights of ducks. First and very soon, we shall see the redheads, and with them will come the canvas-backs. Next, in a few days after, the broadbills (or large bluebills) will come flocking in, and after that the little bluebills bring the pilgrimage to a close. And as the latter swarm into lake and river, marsh and creek, the hearts of the small boys with the Zulu guns, wax glad. The shooting lasts from now until about April 15, commencing with the redheads and canvas-backs, and winding up with the little bluebills. So you see, by being on the spot ready to welcome the vanguard, you not only get better shots but the better birds as well.

It is pleasant sport. Putting your decoys, gun, ammunition, etc., into a duckboat shod with two low runners, you push or drag it over the solid ice to an air hole or bit of open water, perhaps some seventy yards across. Launching the boat, you put out the decoys in the water, which being accomplished, you push the boat some distance off upon the ice. Then, if not already appareled, you don your suit of white, and the duck must be wary indeed who discovers you upon the snow-covered ice. Often the white suit consists of a night cap and night shirt drawn over your regular clothing, and they answer the purpose well. Thus garbed in white, if you stand motionless upon the gleaming snow, the circling ducks will rarely see or fear you. The weather does not chill as in the fall, the reason being, perhaps, that a long winter has inured you to the cold. You sit in your blind, which is formed of ice and snow, or, better yet, of boards painted white, with never a chilly thought.

As for the shooting, I cannot describe it. If you are a good shot, virtue shall have its own reward. If but a passable shot, you can burn lots of powder and bag a goodly number of birds, but you will be ashamed to tell the number of shots you fired. Large bags are made in the spring shooting. Last spring a number were reported of over one hundred redheads to a single gun per day. That is too many. I should not care to be able to boast of such a bag.

One advantage of the season is that it is not necessary every little while to pick up the dead birds lest they float away. Again, as noontime comes, you can walk to the club house for a hot dinner. And who can appreciate a hot dinner more than our duck-shooting brother? All other classes of sportsmen, I verily believe, must yield the palm to him.

Toward night you pull in your decoys, all being fastened to one line, pick up the dead birds which have drifted to the edge of the ice, and, all told, there is a heavy load in the boat that you push back to the house. Then comes the jolly supper, the most enjoyable meal of the day to any sportsman. Then the after supper cigar or pipe, and the after supper chin music follows, as a matter of course. Then guns are cleaned, and then, perhaps, a game of cards, and then to bed for restful sleep.

Not many canvas-backs are shot at the Flats. They will not decoy readily, like redheads or bluebills, who quickly head for the open water upon which the decoys are sitting.

Any one who makes the trip across the ice from New Baltimore, should not be limited to a few days' time. He cannot count upon getting back to the mainland in the same manner. Indeed, it is more than likely that the ice will break up suddenly, and he will be obliged to wait for the first trip of the river boats before he can get home. Such unforeseen (?) occurrences seem to be rather common to certain enthusiastic sportsmen I know of, who run up there "for just two or three days, you know," and who "couldn't get back for two or three weeks, you know."

I happen to remember, just at this moment, a pleasant episode in the experience of a popular hunter at the Flats. He is a representative Canadian Frenchman, noted for his knowledge of the haunts of the black bass and the wild duck. Owning a house near the Lake St. Clair Fishing and Shooting Club, our jolly Frenchman thought it would be a great scheme, some winters since, to move his building across the ice to Johnson's Channel, a distance of good ten miles; and his friends and patrons in the club approved the plan and subscribed the necessary funds, for Johnson's Channel, be it known, is both a favorite angling place for black bass as well as a fine duck shooting locality, and many were glad that soon they could eat and sleep over there, where then there was no house. Our Frenchman was sure of much patronage. He began to discount his future riches, and great was his talk. With the providence of his race, he tarried. The days went by. His friends urged him to move while he had nothing else to do, but still he tarried.

At length he went to work; he cut his house in two parts, the whole being too heavy to move at once. With a couple of teams of horses drawing one half he finally started, four or five other Frenchmen aiding in the work, and each one of them bossed the job. In two days they got the first part safely to the selected site, and, leaving it there upon the ice, went back for the rest of the house. All were jubilant at their grand success. Each claimed the honor of engineering the mighty work. Then they started with the second half of the house, and all went well for two or three miles; and then the south winds blew, and the warm rains came, and there were signs of an immediate breaking up. Then there was hurried running to and fro, and the air was blue with strange oaths peculiar to our Frenchmen. Verbose despair and excitement reigned supreme. Strange, unknown sounds similar to the Tower of Babel noise, were heard twenty miles away. Prayers were profusely uttered, but the ice melted still, and the south winds blew, while the vehement Frenchmen and the horses hastily pulled the section of the house back to the shore. The ice went out. Our Frenchman had a split residence—half on the old site and the other half at Johnson's Channel. Peace to the remnants of the Johnson's Channel half! It was shattered by the ice and the storms and the floods.

Just now the owners of houses and those who have made costly improvements at the Flats are on the anxious seat; the inclosed clipping from the Detroit *Free Press* explains the reason why. Many thousands of dollars have been expended there in buildings, docks, dredging, etc., within the last few years. It was supposed that a squatter's right would hold good for improvements made upon apparently worthless land, or rather water. Land there is none to speak of, except what has been dredged up at great expense. The houses are built upon piles as a rule, and it will be a delicate question to decide who has a right to titles and also to properly describe the area named. It can hardly be called land, water, or marsh. However, as the Flats are daily becoming more valuable it is to be hoped that some decision will be promptly reached, settling the question—who do they belong to? DELTA.

DETROIT, Mich., March 12, 1884.

The article above referred to is as follows:

WASHINGTON, March 12.—Mr. Maybury's bill to give the title to Harsen's Island and Dickinson's Island to the respective heirs and grantors of Harsen and Dickinson is found to cover claims to about all the hunting and fishing grounds of the St. Clair Flats. Don M. Dickinson, of Detroit, is one of the heirs. An outline of the bill was telegraphed Monday. It is learned to-day that the claimants urged the French custom of granting title to the center of the channel, and set forth that the tracts in question when passed over to British domination after the Wolfe and Montcalm campaign of 1754 were reorganized by the treaty stipulations to follow the French custom. The boundaries as given in the two bills comprise the thousands of acres of alluvial land, submerged accretions and vast fields of bulrushes from the ship canal on the south to the mainland on the north and up the usual ship channel of the St. Clair to the head of the island at Algonac. It takes in all the club houses, the Star Island Hotel, the summer villas, and hunting and fishing cabins on land or water. On the North, Middle, Eagle, or South Channels, Anchor and Muscamoot Bays and Lake St. Clair out to deep water. All the habitations of the Little Venice at the mouth of the river go with it.

Members of the St. Clair Hunting and Fishing and North Channel Clubs now here express alarm at the all-comprehending terms of the two bills. Years ago no claim was made to the lands, as they were supposed to be valueless. The general government never caused them to be surveyed, and the only records on file here are those of the lake survey which simply show the shore line and give the depth of water. Now, however, since people from all over the world begin to resort to the St. Clair Flats to hunt and fish, or to seek recreation in the summer, speculators are beginning to look with eagerness on the tract. One of two results are likely to come of the agitation of the subject before Congress. The bills, if passed, will probably be amended so as to reopen the National Boundary Commission of 1822, which will be charged to see in whom the title lays. If not, the control of the whole submerged and bulrush-covered region will be assumed by Congress with a view to making the district a sort of national hunting and fishing ground. If the latter project, which is already formed, should be received with favor, the idea is to allow the right of location where improved by buildings, to lease upon nominal terms privileges for building, and allow freedom of hunting and fishing under such regulations as the laws of Michigan for the preservation of fish and game may direct, or such other regulations in the nature of co-operating with the Canadian game laws as may be thought best.

There are scores of members of Congress who have visited the region—who pronounce it the greatest place on the continent for fish and water fowl—who are in favor of taking it under national control for the purposes mentioned.

Detroit people, who find their best recreation in a summer's day visit to the Flats, should not be slow in asking their senator and representative to take action in this matter. It is as much of a resort for the people as is their island park.

ANOTHER TAXIDERMIST SPEAKS.

Editor Forest and Stream:

Allow me to express my hearty appreciation of the views of your correspondent, F. J. Tingley, in your admirable issue of March 13, page 127. Having been an earnest student of zoology for more than forty years, and humbly instrumental, I hope, in doing away with the old-fashioned "fast day massacres" of all our small birds and mammals in New England, I am constantly laboring to assist all lovers of natural history and earnest sportsmen. We believe that the comparatively few taxidermists and naturalists of our Eastern States should be unrestricted in their pursuits, save by the general conviction that breeding animals should always be spared except in cases of very great emergency. We have attempted in Massachusetts to protect by laws (which require annual tinkering, however) the birds and other animals which serve the farmer by destroying herbivorous insects, and are steadily laboring toward this end, but we license all avowed students of nature, and even those who make taxidermy a livelihood, at a mere nominal fee to procure at any time of the year such material as they may require. And we hope that this liberty in the pursuit of scientific knowledge will never be done away with in any part of the United States. As you very justly say in your foot note, we are killing the birds in their migrations northward. That is to say, when they are unpaired, have no young to protect and care for, and are in their finest plumage for the use of the taxidermist. I suppose few of your innumerable readers have ever considered the very limited number of professional naturalists, taxidermists and other students of zoology or animal life that exist at present in proportion to the vast army of persons of other vocations. A glance at the figures of your various city directories show scarcely one in two thousand—at least—who is likely to assist in the extermination of our beloved native birds and little mammals.

WORCESTER, Mass., March 14. F. G. S.

SUMMER WOODCOCK SHOOTING.

WOODCOCK are here in fair numbers, and as the season draws near, and the law allows them to be shot, perhaps it will be well to once more agitate the matter concerning summer woodcock shooting.

Last July, in company with a friend, we started for a fine piece of summer ground, and, as we expected, soon had a staunch point from our dogs, and on flushing the bird we killed it—a nice female. Going on some distance my friend's dog made a staunch point, and upon going up to her we thought it queer no bird could be found. All this time the bitch was holding her point nicely, but upon examining the ground in front of the dog's nose we found three young woodcock about a week old, which goes to prove what slaughter it really is to shoot woodcock in July.

A woodcock's flight in summer is slow and awkward, so much so that a boy who can keep from shutting both eyes finds it no very great thing to bag his bird in quite thick cover.

Fall birds, however, fly swifter, and it takes a fair shot to make a decent bag where underbrush is any way thick, and besides, just think of how much more you enjoy shooting a fall bird, with its slick overcoat on, than to drop a poor, weak summer bird, half undressed.

If New York, New Jersey and Pennsylvania would pass laws prohibiting the shooting of woodcock until Oct. 1, we would have splendid fall shooting; but as the law stands now, we see the woodcocks' numbers fast growing less. The shooting of woodcock in the summer, too, has something to do with the diminishing ranks of the partridge. I am sure all the sportsmen would be contented in peppering clay-pigeons during the summer months, instead of banging away at weak woodcock. Such, at least, is the opinion of

MADISON, N. J., March 14. 16-BORE.

A HINT TO FLICKERERS.

Editor Forest and Stream:

I voted on the "Flickerings" and, aside from the fact that my vote polled well up toward the winning list, I derived much pleasure from reading the "Flickerings" for their own sake. But also I fear you have killed the goose that laid the golden egg. Judging from the length of the stories published since the vote, very few will have the fortitude to go through ninety-six of them in case of a vote for next year. And further, I think a sportsman who would attempt yarns of like length beside a New Brunswick camp-fire, would have a lonesome time of it. I appreciate the difficulty you are in. In view of the prospect of there being another vote next year, all sorts of mouldy old stories will be sent to you by all sorts of contributors, who, of course, will all feel sure of first prize, and who will feel aggrieved if you exert the ordinary prerogative of an editor in choosing matter for the waste basket. My opinion only will go for what it is worth, but can't "Flickering" contributors boil down this matter more? And it also seems to me that to restore the naturalness of the camp-fire column and take away the mercenary aspect, you will have to abandon the prospect of a vote for the current year. ARBY.

NEW BRUNSWICK, Canada.

THE PROPOSED MASSACHUSETTS LAW.

SECTION 1. It shall be unlawful to wilfully take or kill any woodcock, or any ruffed grouse, commonly called partridge, or any pinnated grouse, commonly called prairie chicken or heath hen, or any quail, between the 1st of January and the 13th day of September following.

Sec. 2. It shall be unlawful to buy, sell, offer for sale, or have in possession any woodcock, or any ruffed grouse, commonly called partridge, or any pinnated grouse commonly called prairie chicken or heath hen, or any quail between the first day of January and the 15th day of September following, whenever or wherever the birds aforesaid may have been taken or killed. Except that any person, firm or corporation, dealing in game, may buy, sell, or have in possession quail and pinnated grouse, also deer, hare or rabbit, in January, February, March and April, if not taken or killed, bought or sold contrary to the provisions and statutes of Massachusetts, or any other of the United States or territories from which said birds or animals are, or may have been received.

Sec. 3. It shall be unlawful to wilfully take or kill any wood or summer duck, black duck, or teal, between the first day of April and the 15th day of September following, or within said time to buy, sell, offer for sale or have in possession any of said birds.

Sec. 4. It shall be unlawful to wilfully take or kill any plover, snipe, sandpiper, rail, or any of the so-called marsh, beach, or shore birds, between the first day of April and the 15th day of July following, or within said time to buy, sell, offer for sale, or have in possession any of said birds.

Sec. 5. It shall be unlawful to wilfully take or kill any wild passenger pigeon, or to take, kill, or have in possession, any crane or heron, bittern, herring gull, tern, sea swallow or mackerel gull, between the first day of April and the 15th day of September following.

Sec. 6. Any person violating Secs. 1, 2 and 3 of this chapter shall be punished by a fine of $20 for every bird or animal taken, killed, bought, sold, had in possession, or offered for sale, in violation of the provisions of this act, and any person violating Secs. 4 and 5 of this chapter shall be punished by a fine of $10 for every such offense.

Sec. 7. Whoever takes or kills any undomesticated bird not named in the preceding sections, except birds of prey, crows, crow blackbirds, English sparrows, jays, wild geese, and such fresh water and sea fowl as are not named in the preceding sections, or wilfully destroys or disturbs, or takes a nest of eggs of any undomesticated birds, except birds of prey, crows, crow blackbirds, English sparrows and jays, shall be punished by a fine of $10 for each such offense; provided that any person above the age of twenty one years having a certificate from a committee of not less than three persons who may be appointed for the purpose of granting such certificates by either the Boston Society of Natural History, the Worcester Lyceum and Natural History Association, the Massachusetts Agricultural College, or Williams College, to the effect that said person is engaged in the scientific study of ornithology or collecting in the interest of a scientific institution, may take the nests and eggs of, or at any season of the year take or kill, any undomesticated birds, except woodcock, ruffed grouse (commonly called partridge) or quail in the close season, or their eggs; but in order to obtain such certificate the applicant must give a bond in the sum of $200 to the committee to whom he makes application for said certificate, said bond to be forfeited in the interest of the commonwealth upon conviction of having killed birds, or taken their nests or eggs, for other than scientific purposes, and shall further present to the committee an indorsement from the mayor of the city or the selectmen of the town where said applicant may reside, to the effect that he, or they, believe him to be a person duly entitled to hold such a certificate. And it is further provided that the said certificate shall not be valid until indorsed by at least two of the Fish and Game Commissioners, and the said Commissioners may, in their own good judgment, exempt and prohibit the shooting of any one or more species of the birds of Massachusetts.

Sec. 8. Whoever takes or kills a gray squirrel, hare or rabbit, between the first day of March and the 15th day of September following, shall be punished by a fine of $10 for every such offense.

Sec. 9. Whoever at any season of the year takes, kills or destroys a game bird, hare or rabbit, by means of a trap, net or spring, or by the use of a ferret; or whoever, for the purpose of taking or killing a game bird, hare or rabbit, constructs or sets any trap, snare, net or spring, or uses a ferret; or whoever shoots at or kills any wildfowl, or any of the so-called shore, marsh or beach birds, with or by the use of battery, swivel or pivot gun, or by the use of a torch, jack or artificial light, shall be punished by a fine of $20 for every such offense; provided, the provisions of this act shall not apply to the trapping or snaring of ruffed grouse, commonly called partridge, or hare or rabbit, by owners of land upon their land, between the 15th day of September and the first day of January following.

Sec. 10. Whoever, with or without a dog, hunts, chases or kills a deer, except his own tame deer kept on his own grounds, shall be punished by a fine of $100 for every such offense; and any person may kill a dog found chasing or hunting deer, if the dog is used for that purpose with the knowledge or consent of his owner or keeper.

Sec. 11. The possession of any deer, or of any of the birds or animals mentioned as protected in sections 3, 4, 5, 7 and 8 of this chapter during the time in which the taking, killing or selling of the same is forbidden, shall be *prima facie* evidence of the unlawful killing of the same.

Sec. 12 Whenever the owner of any land shall conspicuously post on the same notices that shooting or trapping thereon is prohibited, it shall be unlawful for any person to enter upon such land for the purpose of shooting or trapping without permission of the owner thereof; and the presence of any person not having such permission with the implements of shooting or trapping, shall be taken as *prima facie* and presumptive evidence of wilful entry within the meaning of this act. But nothing herein containep shall be construed as conflicting with the provisions of section 11, chapter 91, of the Public Statutes.

Sec. 13. Game artificially propagated and maintained upon lands posted as above shall be the exclusive property of the person propagating and maintaining the same, but such person shall not sell such game for food at seasons when their capture is prohibited by law.

Sec 14. All payments or compensation for game or birds, sold in violation of law shall be held to have been received without consideration, and against law, equity and good conscience. No action of any kind shall be had or maintained in any court for the price of any game of either this or such other State, for the purpose of being brought into this commonwealth to be here kept or sold in violation of such law, under such circumstances that the vendor would have reasonable cause to believe that the purchaser entertained such illegal purpose; and all bills of exchange, promissory notes and other securities for, and evidence of, debt whatsoever, given in whole or in part for the price of game or birds sold in violation of this chapter, shall be void against all persons holding the same with notice of such illegal consideration, either direct or implied by law.

Sec. 15. Whoever offends against any of the foregoing sections of this act, to which a penalty is not applied, shall be punished by a fine of $20 for each offense.

Sec. 16. The Commissioners of Inland Fisheries shall be Game Commissioners also, and their authority, personally or by deputy, shall extend to the protection and preservation of birds and animals in like manner as to fishes.

Sec. 17. It shall be the duty of every officer qualified to serve criminal processes to arrest without warrant any person whom he shall find violating any of the provisions of this act, and bring such offenders before a magistrate. Any officer neglecting or refusing diligently to enforce the provisions of this act, upon information and complaint, shall be punished by fine or imprisonment, or both.

Sec. 18. All fines accruing under this act shall be paid, one-half to the complainant and one-half to the city or town wherein the offense is committed.

Sec. 19. Chap. 92 of the Public Statutes, chap. 199 of the acts of 1882, chaps. 36 and 169 of the acts of 1883, and all acts and parts of acts inconsistent herewith are hereby repealed.

Sec. 20. This act shall take effect on and after May 1, 1884.

The bill reported by the Committee on Agriculture of the Massachusetts Legislature is very satisfactory to those most deeply interested in fish and game protection, and the preservation of song and insectivorous birds in that State. The clause forbidding the buying and selling and having in possession game when unlawfully killed either in Massachusetts or any of the States or Territories of the United States, is a good one. It is the strongest step yet taken toward helping other States in fish and game protection. The marketmen or others who have objected to this clause, saying, "it will kill our trade," have simply convicted themselves of having been doing, and desiring to continue in an unlawful business, beneficial to themselves only, but detrimental to the whole country.

That provision of the bill which requires those who would take birds and eggs under the name of scientific research to give bonds in the sum of $200, is admirably designed to put the power to destroy song and insectivorous birds out of the reach of irresponsible persons. The clause also further provides that although permission may have been granted by an institution of learning to take birds and eggs, yet it shall not be valid till indorsed by the Fish and Game Commissioners. These Commissioners may also exempt altogether the killing of any of the birds of the State. The clause compelling officers to arrest without warrant persons found violating the game laws, is what the Massachusetts Fish and Game Protective Association has long struggled for. Its members have always found great difficulty in procuring warrants in districts remote enough to be the home of game birds. Section 12 of the proposed law empowers the owner of lands to protect the game on such land at all times by properly posting. This provision is believed to be equitable. It was asked for by the farmer, and not opposed by the friends of game protection.

Altogether the proposed law is a powerful one. It is believed to be very likely to become a part of the statutes of the commonwealth. SPECIAL.

HARD WEATHER FOR THE BIRDS.—We have just had a storm that will no doubt kill the grouse that escaped being shot or snared. A rainstorm which lasted several hours and froze as fast as it came, left trees and bushes encased in ice three-fourths of an inch thick. No grouse, unless they had a bill manufactured to order, could pierce this mass of ice. Their food might as well be locked up and the combination forgotten. It is now an impossibility for these birds to get buds or leaves. It has cleared away cold, and the prospect is fair that the trees will be robed in ice for a day longer at least. What can these birds live on? The snow covers the ground, and now their only hope is completely destroyed. It certainly seems strange that our finest game bird has so many enemies. Owls, hawks, skunks, foxes, weasels, squirrels, ticks, and last, but not least, man with his deadly snare. Now, with all their other troubles, their food in a condition that is as impossible to get as it would be to get nourishment from a barbed wire fence. No wonder grouse are scarce; are there any birds that fly that have more enemies? If there are, they should have our sympathy without delay. We shall at no distant day use clay grouse, unless something is done to protect this noble bird from being snared. The law now allows a man to snare on his own land, and privilege to snare is rented to the highest bidder. We have the greatest respect for the farmer, and certainly do not think this law is just as it works now. The usual howl is, the "kid gloves" want all the birds. I do not believe that the average has been one grouse a day for any sportsman in this city during the last season. One man who owns a farm sublet the privilege to snare on his land, and received one pair of grouse each morning. Cannot some of your readers let us know how this ice storm left the grouse (dead or alive) in their section. Pine grosbeaks, bluebirds, snow buntings, song sparrows, tree sparrows, purple finches, ruby-crowned kinglets, robins, were here before this storm. It must be hard for cedar birds, purple finches and pine grosbeaks to get their food now.—FLICK FLICK (Hartford, Conn., March 8).

GAME IN MISSISSIPPI.—*Editor Forest and Stream:* As it has been quite a while since you heard from "Davy Crockett," I will let your army of readers know how hunting is down here. During the severe winter, which we hope has just passed, game, such as ducks, quail and rabbits, have been very plentiful, with now and then a wildcat or a wolf pitched in for a counter. A party of half a dozen went out a mile or two from here during one of the late snows, and bagged over 300 rabbits. In a large yard in the heart of the town—not more than one hundred yards from the court house—some boys killed seven rabbits in the snow; the yard has a large number of forest trees in it, besides many small evergreens and rose bushes. I talked with a gentleman from South Lake, twelve miles southwest of here, last week. He told me he did not shoot ducks by number, but by the acre, having killed all he could back the day before, at three shots. A gentleman living about three miles from town has killed three large wildcats this winter, and says he is just waiting for me to join him to catch the "boss cat" of the brake. He has some splendid dogs, and when they start a cat, all you have to do is wait until it makes a circle, and go near where it has once passed, sit down and be quiet and you can have a wildcat come sneaking along within ten feet of you. Three large wolves were seen crossing a public road not a mile from town, in the broad light of day, not more than three weeks ago. The small boys are shooting robins in the meadows around town now, especially after the birds have become intoxicated on china berries, as is the case when they eat too many.—DAVY (Sardis, Miss., March 8).

SNARING ON LONG ISLAND.—I think Wm. N. Lane's article in your issue of March 6 is about the "last straw." If State Protector Whittaker takes no notice of such violations of the law, whom have we to apply to for the protection of game? I hope this article will so arouse the sportsmen and others who desire the law respected, as to compel the performance of his duties by our game protector. If he refuses, what is the proper remedy? The writer of this hopes to see some one having authority to enforce the laws give Manor and adjoining stations his special attention. I am credibly informed that over two thousand partridges were sent from the above station alone in about ten weeks, and all of them snared. Would like, if the bill now before the Legislature, making the open season for partridges the same as for quail, so far as regards Suffolk county, meets your approbation, to have you lend it your powerful support, and oblige all whom I have conversed with.—C. (Manorville, Suffolk county, March 10). [Our correspondent must remember that the game protectors' salaries are very small, and that they are allowed little or nothing for expenses. We should like to see this subject thoroughly agitated.]

WASHINGTON NOTES.—Washington, D. C., March 15.—A dispatch from the local gunners at Havre de Grace to the Philadelphia owners of ducking outfits last Thursday, that a flight of canvas-backs and redheads had come on, started many of the sportsmen of the Quaker City to the flats. But the rain which visited the country interfered greatly with the comfort of shooting, although fowl were plentiful. I have learned while here at Washington that similar flights of ducks have come to the different grounds in this section. This will be doubtless the last arrival of ducks previous to the general spring migration, and we will no doubt have more open and springlike weather hereafter. Snipe have begun to show themselves in the meadows below Washington, and bunches of five and six together were seen to-day, but the birds were wild and uncertain in their actions.—HOMO.

THE DEADLY MINK.—Cold Spring Harbor, N. Y., March 15.—One night this week a mink killed my entire flock of wood-ducks, fourteen in all, and carried them off. The next morning we found ten of them in a pile of refuse wood under the fish hatchery, with their necks torn, and in three cases the heads off. Two terriers started the mink from the pile, but it escaped in the loose stone foundation, but was captured alive in a trap at night, when the dogs shook some satisfaction out of it, in the absence of Mr. Bergh. The birds had paired and a fine flock was anticipated. I had written to all the sportsmen and market gunners, whose address I could get, for green-winged teal and other beautiful wildfowl for domestication, and have promise of some, which fortunately had not arrived. A pair of Chinese mandarin ducks ordered from France would undoubtedly have gone also, as I have no doubt that the beast would have killed a hundred ducks had they been in the little 6x12 house. Of course I have "covered the well since the calf was drowned," and am sadly in want of more birds to breed from.—FRED MATHER.

THEY STOPPED IT.—The Kent County Sportsmen's Club, of Grand Rapids, Mich., secured the arrest of F. J. Dettenthaler on the 26th of February, 1884, for selling and exposing for sale wild game out of season. His defense was that the birds were not killed in Michigan. They were bought in St. Louis and killed in Tennessee. But we gained our case and stopped the sale. Our law, as now worded, proved too much for the pettifogging efforts of both bar and bench. This shows again the importance of having all laws so worded that they cannot be misconstrued. If language is capable of misconstruction, it will always get it in court. All laws are too wordy and ambiguous, and this is especially true of game laws. Bills for legislative action are too often drafted or amended by lawyers for the express purpose of leaving loopholes for the defense and to encourage litigation. This can and should be avoided by wording them so that they can have but one construction.—OIKOI (Grand Rapids, Mich., March 8).

GAME IN TEXAS.—Our plover shooting opens soon, and depends largely upon the amount of rain falling between this and May. The pot-hunters here destroy more antelope, deer and turkeys than they are worth, in the teeth of our statute made to protect these animals *ferœ naturæ*. Wagons loaded with turkeys killed on their roosts are hawked about the streets here, at the pitiful sum of 25 to 60 cents each. Every kind of duck can be found on the upland lakes here that are found on the prairies of Western Texas and on the Staked Plains. They give our running streams a wide berth because of the alkaline waters.—P. (Colorado, Texas, March 10).

NEW YORK.—Barre Center, March 18.—Weather very cold and stormy. Was out in the woods yesterday and flushed a woodcock. There are a great many partridges left over in the swamps south of here. I have not seen any snipe yet, for which, by the way, we have the best spring shooting in Western New York. We have fine duck shooting in the spring, but none in the fall, as the marshes dry up. We are very much opposed to the passing of any spring law, for we get no fall shooting here. The birds only stay a few days in the spring, and if they change the law we shall have to lay by our guns.—H.

MONROE COUNTY SPORTSMAN'S CLUB.—Rochester, N. Y., March 7.—The following officers were elected for the ensuing year by the Monroe County Sportsman's Club, at the annual meeting last night: President, M. M. Hollister; Vice-President, James H. Brown; Secretary and Treasurer, L. A. Pratt. Committees were appointed as follows: Finance—H. B. Hooker, Edmond Redmond; Vigilance—G. W. Crouch, Jr., Homer Jacobs, H. H. Fleischer; Bird—J. H. Brown, H. B. Hooker, Frank Chaffey. Treasurer Pratt's sixteenth annual report shows $377.05 on hand and no debts.—EDMOND REDMOND.

DUCKS AT ONEIDA LAKE.—Hon. Max B. Richardson and our President, O. S. Osterhout, have just returned from a trip to the wild duck resort at Oneida Lake. They did not forget to take their breechloaders along. They report having a very pleasant time, although the ducks are not as plenty as they were a week or ten days ago.—DAN (Oswego, N. Y., March 11).

WILD TURKEYS NEAR WASHINGTON.—A prominent sportsman of the capital, on whom I can depend, tells me to-day that wild turkeys are yet quite numerous within ten miles of the city. Few are killed, however, owing to the difficulties the rocky and rugged nature of the ground place in the way of successful hunting.—HOMO.

WISCONSIN.—Rosendale, March 5.—Our winter has been a severe one, but the pinnated grouse have come through so far all right; ditto ruffed grouse; but what few quail there were have perished, as it was impossible to care for them in their scattered localities.—S. B. D.

COLORADO.—This is one of the finest game countries I was ever in. Deer, elk and antelope without numbers, many bear, and in spring and fall myriads of geese and ducks. I shall try and send you something very soon about this region.—F. D. G. (Hayden, Routt county).

GRAY SQUIRRELS PROTECTED IN CONNECTICUT.—Only one game act has passed the Connecticut Legislature during the past winter. This was a bill to protect the gray squirrels, and permits them only to be killed between Oct. 1 and Jan. 1.

COLORADO.—Denver, Feb. 20.—Jack rabbit hunting is great sport here now. Geese and ducks have made their appearance to-day. I have seen a large flock of geese flying very low.—I. H. S.

MR. HEATH.—In speaking last week of Mr. Heath's "burst guns" photograph, we stated that he was "with J. C. Grubb & Co." We should have said he can be addressed in care of that firm.

TO F. M. P., NEW YORK.—If this correspondent will write to E. T. Sepe, Nottoway county, Va., he can probably obtain the information he desires.

MICHIGAN.—Linden, March 1.—Quail seem to have stood the hard winter very well in this section.—W. H. J.

BIRDS MOVING.—Heard the first flock of geese going north.—C. B. (Davenport, Iowa, March 18).

MEN HAVE NO RIGHT to expose their families to the risk of being thrown helpless on the world, when they can prevent it at small cost by taking a policy in the Travelers, of Hartford, Conn.—*Adv.*

Camp Fire Flickerings.

"That reminds me."

107.

AN early hour of a morning in the spring of 1876 found a clerical party of four, including the writer, on their way over a ten-mile drive to the L— Reservoir on a fishing excursion. The waters were safely reached, the weather was all that could be desired, and our fishing success and sport were most promising, until our boat struck a hidden log and there stuck. To dislodge the skiff was now the work before us. The writer had the oars, Bro. E. got a "purchase" with a third oar on the log, and the other brethren were to rock the boat. "Now, boys," cried Bro. E., "all together!"

Well, although the fishing of the good brother out of the water was but the work of a moment, not a hair of his reverend head came up dry. By the way, the brother was not of the Baptist persuasion, and he always regarded his involuntary immersion as a disaster. We now made use of him to lift the skiff from its accidental moorings, which he was enabled to do by standing in the water on the log. We then hastily landed him, and he at once stripped himself to the skin, and, donning a linen duster, loaned him by one of the party, proceeded to wring out his various articles of clothing, and spread them upon the grass and bushes to dry. This done, he wrapped around him a blanket that had served as a cushion to one of the wagon seats, seated himself with some newspapers, and endeavored to make himself comfortable. In the meantime the rest of us had resumed our fishing.

In the course of an hour or so we heard a yell, and then a series of excited cries, "Hoi, there!" Looking up, it required but a glance to take in the whole situation. A six or eight weeks' old calf had got hold of the unfortunate man's pants, and, in a playful way, was making off with them. Throwing off his blanket, and hastily stepping into his shoes he started in pursuit, but the faster ran the parson, the faster flew the calf; the former's buttonless duster—well, to say the least of it, it was a poor apology for a covering. But there was an end to the painful scene as both disappeared behind a distant thicket.

I think it was the work of the devil, when, months after, while the aforesaid Bro. E. was occupying the pulpit of the writer, there flashed before the mind of the latter the spectacle of a nude, flying preacher, racing after a skipping, bawling calf, with a pair of breeches flying from its mouth like a streamer. The recollection threatened, for an instant, to produce some sort of atmospheric explosion which, whatever might have been the effect upon the congregation, would doubtless have blown up their pastor. He escaped the imminent peril, but the inward sufferings of that moment, and the outward chills and cold sweats, were his reward for letting the devil get that momentary advantage of him. If the reader can but catch the moral here, the writer will not rue giving this truthful sketch to the readers of FOREST AND STREAM.

HEWILL.

Sea and River Fishing.

FISHING RODS AND DOWELS.

I AGREE with Mr. H. P. Wells, whose letter appeared Feb. 21, on one point, that is, that a rod is best in one piece, but this is impracticable, owing to the difficulties of transportation. To remedy this, get a two or three-joint rod spliced, and abolish the dowels and ferrules. With a little practice it can be put together almost as quickly as a ferruled rod, and even if it does take a minute or two longer; why trout do not require breechloading rods to catch them with before they move off. If the splice is inclined to slacken, dip it into the water and it will get tight enough, but a rod properly spliced will not come apart. I have used one and would not want a better, and never had it separate while fishing.

The best fly-fishing in Canada is in my vicinity, and the rods most used are three-joint with butt of ash; joint and tip of lance wood with only the tip spliced. A good butt will not break at the ferrule, unless subjected to extremely rough usage. A good serviceable rod twelve or thirteen feet long in three pieces as above, will take a half inch counter ferrule three and one-quarter inches long on the butt, with a dowel one inch long, and will weigh about twelve ounces. With this rod a good fisherman need not fear a smash-up with a seven pound two-ounce fish, or a twenty-pound salmon. Tarpons are of course excepted. The style of rods used south of the line 45° seems to tend to extreme lightness and fancy get-up, all very pretty, but unserviceable. A man who cannot fish all day with a sixteen-ounce rod must be weak indeed. These light rods had a run here, but now fishermen are returning to those I described above.

The ferrule Mr. Wells mentions as only holding at the top must be one too much tapered. A rod with properly tapered ferrules and well-fitted dowels feels more like a rod in one piece, and much stronger than his with the very short counter ferrules without dowels. This short ferrule will work loose, and burst open with a sudden strain coming on it. A rodmaker, who is a practical fisherman, told me that he has repaired rods innumerable, and never came across a doweled ferrule broken. And no cemented ferrule or metal dowel end is secure; they must be pinned to give satisfaction. Mr. Wells's experience of smashes must have been frequent and terrible, perhaps owing to cheap material, and he does not seem to possess much genius for emergent repairs. No good fisherman will lose his fishing by breaking his rod, unless perhaps it has been made into match wood by a cart wheel passing over it, or some such accident. Even then he would cut a rod in the bush, and catch as many fine trout as our friend who has not been so unfortunate.

If the joint breaks below the ferrule, and there is nothing at hand to bore a hole for the dowel, cut off said dowel and get a new piece on returning to civilization. If Mr. Wells's joint breaks above the counter, the counter would be too large to move further up on the piece, that is, if the rod has been properly made and the ferrules and counters not sunk into the wood.

Get a rod made of the best of wood and fittings, pay a reasonable price for it, and your expeditions will be enjoyable. A cheap fishing rod is like a cheap gun, most unsatisfactory, and often the dearest in the end.

P. Q., March 6, 1884. MONTMORENCI.

Were it not that the inclosed communication formulates the current objection to the short dowelless ferrule, it would call forth no reply from me.

It is the standing and only objection of those who still favor the doweled ferrule, and if answerable, it should be met.

This objection has one weak point about it. *It is absolutely devoid of truth.* What man who forms his judgment on the merits, and not from prejudice—and it is only to such that it is worth while to appeal—will for a moment think of taking a poorly fitted dowelless ferrule of inferior material (when perfect fitting and good material are easily to be had), as a standard from which to form a true opinion of its merits. Would the writer of the above think it fair play should a visitor to his country judge its inhabitants from the most debased of the population; and declare that all were of that stripe, and that the people of Canada were the scum of the earth? I think not. And, as he would justly protest against such an expression as an outrage, so do I protest against his conclusions and for the same reason.

Besides quite a number that I still retain, there are some dozen or more of rods of my own make in use, presents to friends. The ferrules of all these are short and without dowels, and all made from German silver tubing drawn inside and out. Never in twelve years or more of my own experience, nor I believe in that of those using my rods, has either a ferrule split or a joint thrown apart. And yet I am but an amateur maker, a professional man without mechanical training, resorting to rod making merely as an amusement. It stands to reason that a trained mechanic could do better work. Therefore we have not here the best possible either of work, or material, as a criterion of the merits of the simple ferrule.

These rods have not been used solely against the small fish of the ordinary mountain brook, but much more largely in those waters of Maine where, I believe, it is admitted that the American species of brook trout attain a size not elsewhere found, or, at any rate, only in the Nepigon River of Lake Superior.

In an article in reference to the best color for leaders, which appeared in your issue of Feb. 7, I said: "With thinner gut than this, last September, a friend fastened a trout of 4¼ pounds (weighed to the ounce, and not guessed at) in a dangerous place, and not only held him without giving an inch of line, but hung to him until his guide took the boat into clear water and towed the fish after."

The rod used on that occasion was a greenheart, with split bamboo tip, 9 feet 8 inches long, and united by simple ferrules made by me and in the manner described. The rod and its ferrules, as far as the eye and constant subsequent use could determine, were as good as new.

It will be admitted, I think, that this was a pretty fair test. But it by no means stands alone in my remembrance. I could instance dozens of other occasions where these ferrules have withstood the severest and most sudden strains, and always without damage.

Should I assert that if a man fell from a window he would not reach the ground, but fly off into space and forever after gyrate in an orbit around the moon, you would unhesitatingly assert that it was not true. You have seen bodies fall before, and are familiar with the course they will take. For the same reasons, I assert emphatically *that it is not true.* that the simple ferrule, if properly made (and this is a much easier matter than to make a good dowelled ferrule) will either throw apart or split when subjected to any possible practical strain. A ferrule of leaden material, and the fitting of which is a botch, will give a like result, whether dowelled or simple in construction.

There are men who prefer the muzzleloader to the breechloader, or the heavy plain ash to the light spruce spoon oar, and your correspondent may prefer a pound single-handed fly-rod to one of half that weight. It is a matter of taste, concerning which it is useless to dispute.

The experience of "frequent and terrible smashes" to which he alludes, have not occurred to my own rods, or to rods handled by me, but to the rods of others using dowelled ferrules broken at a distance from home and brought to me in the hope that I could repair the damage so that its owner could continue his sport. But if a rod so broken is a fine and expensive one, it seems one might well hesitate before resorting to so radical a remedy as cutting off the dowel, or endeavoring to bore the hole to receive it with the crude appliances generally at hand on such occasions. My remedy (if the broken rod has been of such character) has been to supply the temporary want from my own outfit.

No angler of experience will question your correspondent's assertion that a spliced rod is better in use than if it were joined with ferrules. But at the same time the liability of the thin ends of the splices to accident, from the many contingencies which will occur in the course of years, and the care necessary to their protection, must not be lost sight of.

His remarks as to the greater proneness of cemented ferrules to become loose is just. But this occurs only in the winter time, and if the angler will take the trouble to examine his rods, before inaugurating a new season (as most do), he can remedy this defect, if found, in less than ten minutes.

This life here below is made up from a judicious selection between unavoidable evils, and of these our constant endeavor is to choose the least.

In the exercise of this discretion, I reject the splice and the fastening pin.

The idea that a simple ferrule will not fit when reset above its former location, is also a delusion. To give that perfect curve, which indicates to the initiated that the strain is equally distributed over a fly-rod, the material should not be evenly tapered from ferrule; but must, for a few inches, be cylindrical and of the same diameter as within the ferrule.

HENRY P. WELLS.

WHERE IS THE BIGOSH?

YOUR correspondents have been telling you where the "Bigosh" is located. Of course they are all wrong; it exists only in the imagination of Mr. Mather, and he has used this pleasant fiction to give your readers a most charming series of sketches, and to convey a deal of information upon the art of fishing. I trust he will continue his delightful papers indefinitely.

If I am wrong, and the "Bigosh" has an objective existence, let me beg Mr. Mather to keep its location a secret. If he tells it, depend upon it the place will be overrun, so that he and his friends will no longer find any enjoyment in visiting it, it will be rendered worthless to them and to all others. It is his secret, let him keep it. May the original party long enjoy its pleasant places.

"Percyval" deserves thanks for his article on "Ferrules." As he invites criticisms, I venture to make two suggestions: First. If the plate or wad of brass, I, were soldered in its place the protection against water would be perfect.

Second. If the ferrules are of sufficient length and carefully made, there is no possible need of the "little brass cleat, C." Three of my own rods are made with ferrules that have no dowels and no cleats. I have never had any trouble with them from "throwing away a joint or two." I have seen this accident occur, but always and only when the ferrules were much worn and ought to have been replaced by new ones. The cleat requires time to whip and unwhip, and is apt to catch, besides it mars the good looks of a handsome rod.

M.

PENNSYLVANIA

A DOMESTIC TROUT POND.

I NOTICE in FOREST AND STREAM of March 6, an account of a successful trout pond (by "W. T.," East Saginaw). It is the first instance of the kind that I ever heard of, and I have visited a good many similar ponds and have actually received hundreds of communications from parties who have tried trout culture in this crude manner, and I do not recall a single instance which has resulted successfully.

Now, Mr. Editor, I will not be so rude as to question the word of any one in relation to fish matters, but I notice that some thirty years have elapsed since "W. T." constructed this $30 fish pond, and it is possible he has grown old some in that time and perhaps his memory may be slightly at fault, though he tells us almost to a pound how many trout he took out of that pond in the four seasons; seven hundred and sixty-three pounds! And this from an original stock of two hundred and fifty young fry! And now right here, "this reminds me," that thirty years ago and thereabouts, I sometimes visited Michigan, not to fish, but on gunning expeditions. I heard them tell how they weighed their hogs before Fairbanks's scales became fairly abundant there. They laid some poles across a log, placed the hog across one end of the poles and piled stones on the other end till they just balanced the hog, then they guessed at the weight of the stones! I remember on one trip killing a deer and a turkey, the ground being covered deeply with snow they could not get at the stones and so guessed directly at the weight of my game. They laid the deer at 200 pounds, and the turkey at 30 pounds. When I got them down to Cleveland the deer weighed 165 pounds and the turkey 21 pounds. Did "W. T." weigh his trout by Michigan methods?

I will now skip the brush work, which if properly done for such a surface would cost about $25, and pass to the embankment, taking "W. T.'s" figures and making allowance for such contours as would admit of the work described (team and scraper); there was not less than one thousand cubic yards of earth moved and placed in this embankment. Now, estimating at the usual cost of such work and at one-third less for man and team than "W. T." allows, it would cost $125 to construct the embankment alone. It will be noticed that this work was firmly rammed, and finally the entire surface was heavily coated with coarse gravel and over this again covered with a layer of as large boulders as they could handle. Now, here is a class of work fully understood by farmers throughout New England, New York, upper New Jersey, all over Pennsylvania and other rocky regions. Would any farmer take the contract for gravel and boulder work alone for $50? Not since I can remember. Well, my main items now foot up $400, and there are extras for spikes, nails, wire netting, planting of willows, etc., which includes a network partition of wire across the pond, one-third the way from the head to the foot; eight large cedar logs stretched across the ravine and weighted with more large boulders (this cedar is not counted), all of these incidentals of which would cost another $50 easily.

Now, Mr. Editor, ask any experienced hydraulic or civil engineer in the country to review my figures, and see if I am not within the practical limits.

I have for several years, at suitable seasons of the year, been quite busily engaged in constructing carp ponds, and am frequently superintending this work in two or three States at the same time, rapidly passing back and forth from point to point and constantly coming in contact with ever-varying locations, on all of which I make hydraulic (instrumental) surveys with mathematical exactness. It is probable that I do more of this work than any ten other men in this country, and it should be conceded that I ought to know with a tolerable degree of certainty what such work costs, even though done in the comparatively crude manner stated by "W. T." He has gone into details and given sufficient figures to enable an engineer to make an approximate estimate. In the first place, I find that his cedar bulkhead must have contained at least 1,000 square feet of surface. Multiplied by four, the thickness in inches of the split plank, would make 4,000 feet of cedar, independent of the fifteen posts, varying from 6 to 34 feet in length, which, if of a size to hold an embankment thirty or more feet in height, it is safe to say contained another thousand feet, making 5,000 feet, independent of the braces. I have handled considerable lumber during the past forty-five years; have been for two or three terms official measurer, and I have never seen the time or place that cedar was not worth at least $20 per thousand feet, more often $30. It will be observed that the cribwork was thoroughly puddled, concreted, and further secured with large boulders. No two men living could get out the stuff and put up such a crib-work bulkhead, with foundations as stated, for $100.

It will, doubtless, amuse practical trout culturists to think how admirably that screen must have worked with two-year-old trout on each side of it, as must have been the case, because the fry introduced could readily pass through it, and they were left undisturbed for two years.

There are a number of other interesting points which I could give in connection with this matter had I the time and you the room. I begin to surmise that "W. T." is an unconscionable, practical joker. He reminds me of one of our leading Philadelphia physicians. A few years ago, when we were having considerable excitement here about our bogus medical colleges, unqualified pharmacists, etc., the physician referred to one evening called at a druggist's and left a prescription, saying he would call later in the evening for it. He called perhaps two hours later, and as the druggist handed him the prescription he inquired if he intended to administer it according to directions, "a dose every two hours." The doctor replied in the affirmative. The druggist then remarked that one dose would be sufficient, as any human being taking it would be dead within two hours. By this time the doctor had removed the wrapper and found the prescription prominently labeled "Poison." The doctor then remarked that he had been riding among drug stores the entire evening leaving this identical prescription, that this was the fifteenth one collected and he the first druggist to notify him that the four simple ingredients formed when combined a deadly poison. Readers can make their own application.

MILTON P. PEIRCE.

PHILADELPHIA, Pa.

TROUTING ON THE BIGOSH.

FISHERMAN'S LUCK.

THE Doctor's preference for fishing up-stream has been stated, and as we laboriously forced our way over logs and through thickets along the shores of the lake, it was decided that he should strike in at the mouth of the brook, while I would keep on up the valley as far as was found practicable or convenient, and then fish down until we met. It may be remembered that he chose to wade in low shoes, the best of all things for a man who does not object to having his feet in cold water while the sun broils down upon his head, while I had elected to wear wading pants with boot attachment as a precaution against possible rheumatic twinges in the near future. These appliances for wading dry-shod were slung on my back, for it would have been impossible to have climbed over logs with them on, and, in fact, they are cumbrous even in water. If the little grasshopper becomes a burden, how much more does a stiff pair of trousers, which hamper the knee action and, ending in a heavy pair of boots, handicap a man who is more than knee-deep in water and on the unsteady footing of mossy stones? So on we trudged over logs and around tree tops, and such other obstructions as are well known to those who love to frequent forests which have never known the axe, and are in reality the pathless woods whose pleasures have been poetically mentioned.

Arriving at the upper end of the lake, I showed the Doctor where Jack and I struck in and found the stream, not over two hundred yards from the edge of the swamp where we stood, and wishing him luck kept along the edge of the hill for dry walking, and forced my way up the valley, intending to strike the stream as high up as an hour's walk might bring me.

"The green trees whispered low and mild;
It was a sound of joy!
They were my playmates when a child,
And rocked me in their arms so wild!
Still they looked at me and smiled,
As if I were a boy.

"And ever whispered, mild and low,
'Come, be a child once more!'
And waved their long arms to and fro,
And beckoned solemnly and slow;
O, I could not choose but go
Into the woodland's hoar."

And so, mentally repeating Longfellow's lines, I pushed on,

"Through tangled juniper, beds of reeds;
Through many a fen where the serpent feeds,"

until my watch, which I had often consulted, to see if my hour were not up, and the mile covered, which we reckoned would take that time, said that full sixty minutes had passed since the Doctor was left near the junction of stream and lake. I was on the south side of an east and west ravine, but the trees were so thick that I could not see how far it was to the other side, or form any idea how far it might be to the creek. It occurred to me that there might be a valley coming into this one from the north, and that the stream might come down that, in which case there would be no fishing for me that day. This horrible suspicion must be set at rest, and, climbing the hill, I looked about for an opening from which I could see across the hollow. No such place was found, and then a tree which could be easily climbed was sought and found; and from half its height a view above the tree tops of the valley was obtained, which showed it to be about half a mile wide, and gave the cheering assurance that no valley came in from the north between the lake and the point opposite. Descending the tree, I started down the hill due north into the bottom of the valley, in order to strike the stream.

It was hard work to push through the tangled grasses, cat briers, and undergrowth in the swampy bottom, and the stream seemed a long way off. My watch showed that three-fourths of an hour had been consumed in crossing the half mile of valley, and the severe labor in the close atmosphere was the cause of a suspicion that while wading a stream for trout might be sport, there was less pleasure in wading a swamp in search of a stream. The ground began to rise! Where was the brook? I had expected to find a rapid stream which changed into the deeper and more sluggish one below, but there was nothing of the kind. I sat down and did two things at once, and did them well. Some one has said that two things cannot be done at once and done well. Like most "old sayings" there is little truth in it, for I rested and lunched in the most thorough manner, at the same time. After this I essayed to do three things at once and accomplished it as easily as the two; I rested, smoked and thought. Carefully reviewing the field it seemed certain that the "Little Bigosh" must rise between where I lay and the lake. The ravine had no branch to the north and I had not crossed a stream on the south side of it. The result of the thinking, which was arrived at just as the pipe was finished was, that if I traveled back east for half an hour and then crossed the ravine there would be a chance of finding the stream.

Shouldering the boots I started, and when the watch showed that I had labored for full thirty minutes, I changed the course to due south, again to cross the valley. The growth here was denser, and the footing was worse, as the ground was more springy and soft, often quite marshy. Twice the boots and I sat down on a log to rest, and at last the springy nature of the ground made it necessary to put on the boots in order to keep dry. This was not a thing to be done without cause, for, if it was as much as a man could do to get through the undergrowth without the encumbrance of wading boots, it promised to be more than he could perform to travel with them. They were put on and the wet shoes slung to the creel strap, and another start made. Each step seemed to be made on softer ground, and the heavy wading boots pulled harder and harder, until it was a question whether it would not be best to turn back. While considering this I stepped on a stick and broke it, and a few steps further in I heard the Doctor say in a low tone, "You appear to be traveling, sir!"

"O, no," said I, "the day is pleasant and I am merely walking for exercise. It is the height of pleasure for me to pull wading boots out of a swamp, and I have enjoyed it at the rate of half a mile an hour for about three hours. There is nothing like exercise for getting rid of superfluous flesh, and if, like Falstaff, I have 'larded the lean earth' as I marched, and it is pleasant to know that the alders and the skunk-cabbage will be enriched thereby. Any grub left in your creel? I devoured mine two hours ago."

"No, I took a lunch about half an hour ago," replied the Doctor, "and afterward stepped on a log that was under water and the bark peeled off, and I decided to sit down, and I not only wet my luncheon but my tobacco and matches. That is a trifle, however, for I have had rare sport on a virgin stream. See here!" and he lifted the cover of his creel and showed a glowing mass of ruby-flecked trout, that under different circumstances would have made an angler's heart throb five beats to the minute more than usual, but when his heart has been doing double duty in pulling wading boots out of the muck for several hours, it is hard to stimulate his aorta to extra duty by glimpses of fish, unless they are fried. I had tobacco and matches, and we sat on a log and smoked.

After the ashes were knocked from the briarwoods the Doctor said, "You have had a hard time and are entitled to some fishing; take the stream down and I will follow the swamp around and meet you at the lake where we parted."

"Doctor," said I, "you mean well, but if you love me let me get into camp as soon as possible. I have climbed logs, crawled under tree-tops, been mired, climbed trees and worked like a stevedore, in the hope of striking a stream of which I knew nothing when I started, only to learn now that its head is not half a mile from its mouth. I don't want to fish, I only want to get in camp and stretch out on the hemlock boughs and have fun."*

"Pshaw," exclaimed the Doctor, "the head of the brook is just there beyond that big cedar, it rises from a big spring, and you must take a trout or two before we go back, and it can be done from the spring. Then we will return to camp and you can lie on the hemlocks and 'have fun.'"

I yielded, and took his rod and line, which he had not unjointed, and said I would try for a trout or two, and approached the pool, which was the head of the stream, with great caution, in order not to disturb the trout by jarring the bog, which shook with a heavy tread. After a few casts of thirty feet, as long as the bushes would allow, I stepped into the pool and waded down a short distance. There was a "likely place" under the roots of a sycamore, and a cast there was rewarded with a rise. I had him, I fought him according to rule, and against it, for all I know now, and as I put the landing net under him a slippery root sent my boots up and even my ears obtained a free bath. The trout was still in the net, and the Doctor remarked, as he unscrewed the top of his life preserver and handed it to me, "We might as well go back to camp, but I'm glad you have one trout, and a big one."

I emptied the water from the big boots, and shouldering them, we went homeward. It was late in the afternoon when two tired, wet and hungry fishermen tramped in and devoured everything eatable in the camp, which appeared to be deserted. By the time that the last bone was polished, the boat, with the Colonel, Jack and Uncle Ben, drew up on the beach, and they crowded around to see the results. The Doctor's creel showed up well, but when the Colonel heard the story of the day's tramp and my misfortune, he repeated a couplet containing some allusion to "fisherman's luck" and his being wet and hungry, which I have forgotten.

FRED MATHER.

*This has long been a favorite expression of mine for sleeping, but as it is not generally understood, I explain. With Sancho Panza I can say, "Blessed be the man who invented sleep; it covereth one all over like a blanket." My idea of jolly, hilarious fun is a sleep of insensibility. I know that I will enjoy that last sleep that knows no waking, no printer howling for copy, and no boots to pull out of the mud. If the fishing in the Styx is all done from a boat, I know I won't care to get out on the other side. There is no fun like that which one enjoys.

HOW THE LEADER IS BROKEN.

HAVING already re-echoed "J. G. W.'s" question in your issue of March 6, I am now tempted to answer it myself, and, as human nature is weak, I yield to the temptation.

He says, "We have all read time and time again of a bass when hooked leaping from the water, and falling on the leader so as to break it. How does he do it?"

We have all read it again and again. But for a bass to so break a leader, is as impossible as it is for a man to lift himself by the straps of his boots.

Perhaps the following explanation may not be quite so severe a draft on our credulity.

That the leader is in peril under such circumstances, is undoubted. Why?

The bass leaps from the water, throwing into the movement every ounce of his immense muscular strength. His momentum then equals his weight multiplied by his velocity. But the weight which here enters into the problem is not his weight in water (which is less than nothing since a dead bass will float), but his weight in air—we will say four good solid American avordupois pounds. When, therefore, the angler seeks voluntarily or involuntarily to check or control this gyration with a tight leader, he subjects it to a strain that no fish of four times the weight could begin to impose if beneath the surface, and it not unnaturally parts. What the angler then does I will not say. HENRY P. WELLS.

NEW YORK.

BUT IS IT TRUE?—Boston, March 13.—I clipped from Saturday night's *Transcript* the following: "Hon. Hannibal Hamlin and party have returned from Moosehead Lake with a fine catch of trout." It speaks for itself. If a poor devil was camping out at any of the many desirable places in the State of Maine, and tried to vary his bill of fare or eke out his provisions by shooting a solitary deer or caribou before Oct. 1., the Great American Game Warden was pretty sure to find it out and to "sock" it to him accordingly. But the honorable gentleman makes his annual trip, and comes home with a "fine catch of trout," caught, as I understand it, through the ice, against the law of the State. Where was the Great American Game Warden, of whose zeal in enforcing the law (principally against non-residents) we have read so much in FOREST AND STREAM lately? Where was he?—C. G. G.

THE TROUT OPENING.—Mr. E. G. Blackford has issued his annual invitation to inspect the many varieties of wild and cultivated trout. It is a beautiful card with an original picture of a trout rising at a fly, by the well-known artist, W. Holberton. Mr. Blackford's display will comprise fish from many of the States and also from Europe, and Fulton Market will be crowded, as usual, by lovers of the beautiful fish.

STRIPED BASS IN CONNECTICUT.—On the 12th inst. John Wilber caught 800 pounds of striped bass in the Thames, at Norwich, Conn., the largest catch in many seasons.

SMELT FISHING IN MAINE.—I read in your issue of Feb. 20 an account of smelt fishing in Saco, and I think an account of the same in another town in Maine may be of interest. I left Waldorough, Me., seven weeks ago. There were then about sixty shanties on the river. They are neat little houses of ¾-inch stuff, and vary from 4x6 feet to 6x10. A cousin and myself fished in a shanty 6x10, and we used twelve lines. From Dec. 26 to Jan. 20 we took from fifteen to forty pounds every day, usually averaging in size about nine to the pound. We fished about four hours each day, just before and after low water. I left for home Jan. 22, but I have learned that there has been not more than a week since when the smelts did not bite. We use a great variety of bait, but nothing attracts them like marine worms or clam worms.—GEORGE W. SINGER.

Fisheulture.

THE SHELLFISH COMMISSION OF CONNECTICUT.

WE have the third report of the Shellfish Commissioners of the State of Connecticut, to the General Assembly, January session, 1884. Before the passage of the act of 1881, placing the State grounds in charge of the Commissioners, all designations were made by town committees. With few exceptions these committees were more familiar with the water and its industries than with law, and their work was defective and incomplete. The boundaries of grounds were not well defined. This has complicated the work of mapping old grounds and made changes necessary. These have been accomplished to the general satisfaction of the oystermen.

During the three years of their service the Commissioners have sold 38,548 acres, which netted to the State the sum of $42,403.79. Besides this 12,539 acres more have been allowed, and deeds ordered therefor, which will net the further sum of $13,793.78. Rejected applications have generally been owing to the fact that the grounds applied for were on natural beds, or had already been designated to others. Taxes were laid upon the oyster grounds within State jurisdiction for the benefit of the State for the first time during the past year; $3,681.47 was collected without resort to legal measures. By law all owners are required to file with the Commissioners a statement under oath, wherein they shall not only give the number of acres owned by them, but also the value thereof per acre.

The report is very interesting and gives much information about starfish, natural beds and the laws relating to the shellfisheries. It is time that New York did something in the way of systematizing the leasing of oyster beds and placing the whole matter in the hands of the State and ending the conflict between the towns and counties of Long Island, which has been in progress for a century or more. The Connecticut Commissioners are R. G. Pike, chairman, Middletown; Dr. W. M. Hudson, Hartford, and G. N. Woodruff, Sherman.

DO GERMAN CARP HIBERNATE IN CENTRAL NEW JERSEY?—Authorities on carp culture inform us that this fish passes the winter in a semi-dormant state; that a number of them assemble together, thrust their heads in the mud with their tails upward and outward, thus forming what is called a kettle of fish. That they do not pass the entire winter in this way in the latitude of Central New Jersey has been clearly proven during the winter just closed, as shown by the following statement: Having accustomed my fish to a certain portion of the pond by throwing them small bits of bread for which they showed great fondness, and after which they come to the surface of the water, they continued to make their appearance there on pleasant days till the 9th of December last. The pond then becoming frozen over, I saw nothing of them again till the mild weather in February. On the tenth, and again on the twenty-seventh of this month they made their appearance. Besides the fragments of the submerged leaves of the yellow pond lily (*Nuphar advena*) which the winter does not kill, floating about and partly eaten, gave unmistakable evidence that they had been feeding. As they continue active all winter in Southern waters, may they not do the same also in this latitude?—J. H. B.

PENNSYLVANIA STATE HATCHERY.—It is reported that the property of H. J. Schantz, near Allentown, has been rented by the Pennsylvania State Fish Commission for a period of ten years. New buildings will be erected this spring, and the State fishery will shortly be removed from Donegal, its present location, to the new site.

CALIFORNIA TROUT FOR TENNESSEE.—The United States Fish Commission car from Wytheville (Va.) hatchery, arrived at Chattanooga, Tenn., on March 14 with 4,000 California trout. The fish are to be distributed in the streams of East Tennessee, Alabama and Georgia, and it is said this lot of fish is the most valuable ever sent South.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 18 to 21.—Washington Bench Show, Masonic Hall, Washington, D. C. Chas. Lincoln, Superintendent.

March 26, 27 and 28.—The Dominion Kennel Club's Second Annual Bench Show, Horticultural Gardens. Charles Lincoln, Superintendent. W. S. Jackson, Hon. Secretary, Toronto, Canada.

April 3, 4 and 5.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio. Entries close March 24.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1010.** Volume I., bound in cloth, sent postpaid, $1.50.

CLEVELAND DOG SHOW.

Editor Forest and Stream:

From the number of entries already received the indications are that our second bench show will be a great success. The citizens of Cleveland are taking a great interest in the exhibition, and are donating a number of special prizes, which will be announced in due time. Count Noble and Dido II. will be here for exhibition. They will be a great attraction for sportsmen, and we hope to see many of them here from all parts of the country. We can assure them a hearty welcome.

C. M. MUNHALL, Secretary.

CLEVELAND, March 15.

NEW HAVEN DOG SHOW.

THE first annual bench show of the New Haven Kennel Club, held at New Haven, Conn., last week, was a decided success. There were three hundred and eight-five entries, and only about a dozen of them were absent. There were quite a number of puppies shown, which brought the total above four hundred. There was a very good showing of local dogs, fully one-half of the entries being from New Haven and immediate vicinity. The building is very well adapted for holding a show, being large, well lighted and ventilated. The benching of the dogs was admirable; the large dogs were in roomy stalls which extended clear around the sides of the hall, making a very attractive appearance. There were three double rows of benches extending nearly the length of the room, with wide alleys between, giving plenty of room. Many of the stalls were tastefully draped and decorated, adding not a little to the attractiveness of the show. The managers are entitled to a great deal of credit for the very excellent manner in which they conducted the show. No labor or expense was spared to make the exhibition satisfactory to all, and we heartily indorse the many encomiums that we heard bestowed upon the managers for the excellence of the arrangements. The attendance, notwithstanding the bad weather, was very good indeed, and it gives us pleasure to announce that the balance was on the right side of the books. The club intend to hold a show each year, and without doubt they will receive the cordial support they deserve

The judging was generally satisfactory, although a few mistakes were made. Mr. James Watson judged the pointers, setters, spaniels, greyhounds, deerhounds, foxhounds, beagles and dachshunde, and Mr. James Mortimer the remaining classes, except the trick and retrieving dogs, which were judged by Mr. J. R. Pierson. In commenting upon the dogs we have indulged in no spirit of fault finding, but have endeavored to point out their faults for the benefit and instruction of those of our readers who have not had the experience necessary to form a correct opinion.

MASTIFFS.

Champion mastiffs had only one entry, Mr. Mason's Nevison. He was looking very much better than we had ever seen him, and barring the rather unsightly protuberance on his nasal bone and his habit of knuckling over, he is a very fine dog; he has filled out wonderfully.

In the open class for dogs, Mr. Burgess's Hero had virtually a walk over, as there was nothing in the class that could get near him. He has a very good skull, ears well carried, and a square muzzle, good color and mask. His faults are a slightly tucked up appearance, and he falls away a little under the eyes and has a greyhound tail, but, taken altogether, he is a very fine animal.

Agrippa, second, is a well shaped but small dog, with a plain head and rather a light eye. Surrey, hc., is a large dog, a little smutty in color, rather leggy and short in body. Romeo, c., possesses some good points. He shows age and was in poor shape. The others call for no special comment.

In mastiff bitches, Dutchess, first, is a good roomy bitch, rather light in bone and has a bad eye. Juno, second, has a very good skull and muzzle, and is of good type but is undersized and out at elbow. Queen, vhc., is a fair bitch and will improve, we think, with age.

The only entry in puppy class was absent.

ST. BERNARDS.

In champion rough-coated St. Bernards, Bonivard, the only entry, was shown in the pink of condition. He is a very typical dog, good in coat and color. He has that benign expression of countenance which should characterize this noble breed of dogs. Bonivard also won the special prize for the best non-sporting dog in the show.

In the open class (dogs) the Chequasset Kennel's Hermit beat the Clovernook Kennel's Samson in head, bone and coat. His worst faults are his light body and rather badly-carried tail, he is also rather straight behind. Samson, second, has a weak, bitchy head, and is a trifle too curly in coat; he, also, has a ring tail. He is, however, a five young dog. Felix Mendlessohn (vhc.) has good coat and bone, but a rather weak head and bad ears. Duke (hc.) and Guy (c.) were very bad in head properties, and looked more like immense collies than anything else. They should not have been noticed. In bitches, Mr. Hearn's Gertie, a very well made, roomy bitch, of good color, won easily, all other awards being withheld. In rough-coated puppies Schoonhoven, a seven-months old puppy of good bone and size, coat and color, was an easy first, the other entry only getting a c.

There were no entries in the champion smooth-coated St. Bernard class.

In the open class (dogs) Alexander, a fair dog, with no especial merits, was the only entry. He was awarded first. In bitches, Juno, an undersized bitch, was awarded second prize, the first being withheld for want of merit. In puppies, Billy, a rather plain puppy, but with good coat and immense bone, won over Eckhardt, who was given second.

BERGHUNDE.

There was but one entry in the berghund class, a fair Newfoundland in looks; in fact he was better than any in the Newfoundland class. The award was properly withheld.

NEWFOUNDLANDS.

First and second prizes were withheld. Jack, who was vhc., is of good size, which is about all that can be said in his favor. The others we did not consider worthy of mention.

BLOODHOUNDS.

As there was nothing in the class that had any pretention to the name, all prizes were withheld. There was a very good Ulmer in this class—Dink. The nearest approach in looks to a bloodhound was Trump, a cross between the mastiff and foxhound.

GREYHOUNDS.

The managers were very liberal with the greyhounds, dividing the class into two champion and two open classes. There were eight entries, six of them receiving prizes. Four firsts and two seconds were awarded which should certainly satisfy the owners, especially when we take into account the quality of the exhibit, which was not of a high order of merit. Friday Night had a walk over in the champion dog class. He staked himself a few weeks ago and was in very bad condition. Fan also had a walk over in the bitch class. She was in elegant condition, and except that she is a bit too small, is about as good as we have. In the open dog class Doubleshot, who was given first, was in good condition. He has not sufficient greyhound character to win in a good class. Dell, who was second, should have been first. He is a good specimen with a good and well balanced head, a magnificent coat and shapely body. He is a trifle weak and straight behind, and has a bit too much hair in his tail. Dorothée, who won first in the bitch class, has a good head and a deep chest, and was in good condition. She is a trifle too wide in front, and might be better behind. Lufa, wrongly entered as Lupa, was given second; she should have been content with less. She lacks quality, and is light with very straight stifles.

DEERHOUNDS.

The deerhounds were very good all through, Lance, who was the only one in the champion class, is a very good specimen with no weak points. His shoulders and feet are capital. Roy, who won first in the open class for dogs, is a fair animal rather out of condition. Fleet, who won second, we liked full as well for first. He has a good head, and shows much quality. Roderick Dhu, hc., is also fairly good, except in coat. Blake's Lorna II., who won in the bitch class, has a good head with a long clean jaw, and is an animal of much quality. The same may be said of Thayer's entry of the same name, who won second; she is very near the winner. Thora, unnoticed, also shows lots of quality, but shows mange and want of condition.

POINTERS.

We expected to see a good showing of pointers, as there are many owned in this portion of the State, but they failed to put in an appearance in sufficient numbers to fill the classes as they should have been filled, and the showing was rather ordinary, although there were some good ones present. In the champion class, Peter Black, Knickerbocker, and Lassie were the only ones to compete, Rhona being absent. The Westminster Kennel Club, who own Lassie, declined the offer of a separate class for her, preferring defeat rather than to win without competition., and the three were judged in one class, and the pride of place was given to Lassie. Some one raised the point that the class was understood to have been divided, and the two dogs were then compared, and Knickerbocker was also awarded a champion medal. Lassie was shown in fair condition. She is quite a good bitch with a fair head, capital fore legs and feet, good back, quarters and stern. She is a little weak and straight in stifles, and a trifle throaty. She is also growing old. Knickerbocker was not in first-rate condition. He has a fair head, good chest and plenty of bone; he is a bit wide in front and might have a better back and stifles. Peter Black is a fair dog with good legs and feet, he was looking well, but was soft. In the open class for dogs over 50 pounds first went to Beaufort, who was decidedly the best in the class. He was not in nearly so good condition as when at Washington last year, having but recently recovered from an attack of inflammation of the bowels. Although his coat was in good condition, his eyes were not bright, and he did not carry himself in the faultless style he affects when at his best. Zeb, who won second, is rather a taking dog at first glance. He stands straight on a good set of legs and moves very well, he has rather a plain head, and might be better in shoulders, loins and tail; his coat looks well, but is rather long. Bravo, vhc., was very well shown, he has plenty of bone, and good legs and feet. He is a bit heavy in head, throaty, and out at elbows. Bud, hc., is a fair dog, with good legs and feet, he has a fine head, except that his ears are set on too high, he is also a trifle weak in stifles. Jimmie, also hc., we liked as well as any in the class, except Beaufort. He has a fair head, a good coat and tail, and the best of legs and feet; he is a trifle wide in front, and has a light eye, which detracts somewhat from his good looks. We also liked Fritz, unnoticed, for the two letters, he has a fair head with good shoulders, legs and feet, he is a bit snipy, and might be better in tail and hindquarters. In the small dog class there were but two entries, both very bad ones. The first prize was withheld, and the second should have been also. There were three entries in the large bitch class; none of them were first rate. Lady Gleam, who was placed first, is light in bone, wide in chest and coarse in tail. Lill, who won second, we liked better for first. She shows considerable quality, and has capital legs and feet and a good loin. She is also wide in front, a bit snipy, and has a coarse tail. She was well shown. Mab (hc.) is a fair specimen only, with weak hindquarters. In the small bitch class first was given to Lady Bang. She has a good body, legs and feet. She is a little too round in skull and carries her ears badly. She is also throaty, and might be better in tail. Moonstone, who won second, was not in good condition. There was not much to choose between her and Polly (vhc.), who has a good head, legs and feet. She is a trifle wide in front, and might be better in shoulders. She did not show at all well. Bertie (hc.) is a fair looking bitch, with no very good or bad points. In the puppy class, Lady Nixon, who won first, is quite a pretty bitch, with a good body, shoulders, legs and feet. She is a bit snipy, and might be better in tail. Lennox, who was second, is a big fellow, a bit lathy and coarse. He has plenty of bone, and may improve with age.

SETTERS.

Lava Rock, the only entry in the English setter champion class, was absent. In the open dog class, Yale Belton, who won first, is quite a nice dog; his head is fairly good, he has plenty of bone with good legs and feet, and good quarters. His tail is also good; he was in good condition, except that his coat was rather short. He is a bit wide in front, and does not move quite so free and easy as we like to see. Jester, who won second, is a very good-looking dog, with good shoulders, legs and feet and tail; his head is fair, but a trifle heavy; he is badly undershot, and was in very bad condition. Pride of the West, who was vhc., we fancied for first place. He has the best head in the class; his shoulders are fair, and he has a good chest and quarters, with the best of legs and feet; he has a nice coat, and was in fair condition. He carries his tail too high, which is about the worst fault. Royal Sultan, also vhc., got all that he deserved. He was not in good condition. Frank, who was hc., is a useful-looking dog, with plenty of bone and capital legs and feet. He is rather plain in head and heavy in shoulder. Tom II., who was c., deserved another letter. He has a good head, plenty of bone, with good legs and feet. He might be better in hindquarters. There were a number of useful-looking dogs in the class that we have no doubt are capital workers, but they are not quite up to bench show form. In the bitch class, Blue Belle won first. She was in her usual good form, and, as usual, was shown a trifle too fat. She has capital shoulders, plenty of bone, with good legs and feet. If her head were as good as the rest of her, she would be hard to beat. Alice Dale, who won second, is very close to the winner. She has a very sweet head and is good all over except that her elbows set too far under her, and her feet turn out a little. The remainder of the class we did not fancy, although, as in the dog class, many of them looked like workers. The puppies were a fair lot and well placed except that we should have given Bess, in the bitch class, another letter. She is a very nice little thing, and we shall expect, if she goes right, to see her beat the winner next year.

Champion black and tan setters brought out three good ones. Turk, who won the first prize, was looking better than we ever saw him. Argus was also looking well. He is but a trifle behind the winner. Trump is also a capital dog, but he begins to show his years and was not in good condition. In the open dog class, Glen, who won first, is a big upstanding dog of good form. He moves very well and was entitled to the place. Gem, second, and Chris, vhc., are both fair specimens with not much to choose between them. The bitch class was poor. The first was withheld, and second given to Clip, who is only a moderate specimen; none of the others were worthy of mention. In the puppy class there was a litter only twelve weeks old that look promising, but they were too young to be shown, the only other entry was given the prize. He was only fair. There were no entries in the champion Irish setter class. In the open dog class, Dash, who won first, is rather a taking dog to look at. He has a fair body with good legs and feet. He is very dark in color and has a Gordon head, and carries his tail too high. Second went to Dick, who is a fair dog with good body, legs and feet. His head is not first-class, and his ears are set on too high. Rory O'More, Jr., who was given vhc., was the most typical Irish dog in the class, and should have been first. He has a good head, is fairly well formed, of good size and color, and has good legs and feet. He was not shown at his best. Red and Roe, both hc., were only moderate. Many of the others were quite fair animals, but more of the English than Irish type, and not deserving mention in an Irish class. The bitch class contained nothing remarkably good, neither did the puppy class; we thought them as well placed as possible.

SPANIELS.

There was only one entry in the Irish water spaniel class. He was rather a useful-looking dog of no particular breed, and the prize was properly withheld. Benedict was alone in the champion class for field spaniels. He was not in his usual good form. In the open class, first, second and hc. went to three fair Clumbers; Punch, who was first, beat John Halifax in bone, otherwise they were nearly equal. Vesta, hc., is a very promising puppy. C. went to Beauty, a liver and white with rather a pleasing head. She has a curly coat and is a bit leggy. The others were a poor lot. There were no entries in the champion cocker spaniel class. In the open dog class first went to Obo II., a first-class little dog. He was shown a bit too fat and was a little off in coat. Sport, who won second, is a liver with white on his breast. He is also quite a cocker with a capital coat. He was timid in the ring, and did not show well. The others were not worthy of mention. Fido, who was entered in this class, is a fair Irish water spaniel, and would undoubtly have secured notice had he been in his proper class. In the bitch class, Blackie III. had an easy win. She is a very well-formed bitch, with a splendid coat. She has a light eye, and stands just a bit high on her legs. Queen, who was second, looks as though she might be a very fair animal when in condition. She was nursing a pretty litter. Suwanee, hc., is very pretty, with a good head. She is very light built and was short of coat. The puppies were a grand lot. Helen, who won first, bids fair to turn out a nice one. She is of good shape, with capital legs and feet and lots of quality. Her coat is a little curly, but she may outgrow this. Sambo, who was second, except that he is a trifle crooked in front, is very good. He is rather large for his age, and will probably outgrow his class. Darkie II., who was vhc., is well formed, and has a fair coat. She is a trifle too high on her legs. Dandy Zulu, hc., is also well formed, but was badly shown.

FOXHOUNDS.

The foxhounds that were noticed were a workmanlike looking lot, but not quite up to the form called for by the standard. Jerry II., who won first, is about the stamp of dog that New England fox hunters secure when they can, and keep when they get them. There were no entries in the puppy class.

BEAGLES.

There were only two beagles shown. Both were fair animals. They were properly placed.

DACHSHUNDE.

There were three entries in this class, only one of which was a dachshund. He was quite a fair specimen and entitled to his prize. The others were properly unnoticed.

FOX-TERRIERS.

The fox-terrier classes did not fill well. Richmond Olive was absent and Vixen had a walk over in the champion class. This is an honor that she is not entitled to, and how so good a judge as Mr. Mortimer could bestow a champion prize upon so worthless a specimen, we cannot understand. She is very thick in skull, wide in chest, out at elbows, very poor in coat, and has bad open feet. In the open dog class, Lancelot, who won first, is a very showy dog. He is just a little too high on his legs and was not in goood coat. Nip, who won second, has a good coat and fair legs and feet. He is a trifle thick in skull, wide in chest, and his ears are set badly. In the bitch class, Jaunty, a very moderate specimen, was given second, first being withheld. In the puppy class, Clover Belle won first. She is a fair specimen with good coat, shoulders and feet. Rascal, who won second, we do not like. He is coarse and out at elbows and will be too large when matured. We liked Boxer, vhc., better for the place, although he is nothing to brag of, being leggy and with a poor coat. The others were not worthy of mention.

COLLIES.

The show of collies was very fine. Robin Adair had a walk over in the champion dog class. He was very well shown, except that he was short of top coat back of his shoulders. Zulu Princess, the only entry in the bitch class, was absent. In the open dog class first went to Bruce, a nice dog with a good head, body and coat. Hiram, who was second, has a profuse coat which is of good texture. He has a fair head with rather heavy ears. He was much too fat. Brack, who was vhc., is a well-made dog, except that he is a trifle too close coupled. He has a good head and well-carried ears. Rokeby, hc., is a nicely colored sable with a good head and coat. He is a little sway-backed and might be better in shoulders. Donald, hc., and Sandy, c., are quite fair little dogs, rather light in coat. Both have the domed skull that we often see in the progeny of Marcus. In the bitch class, Iona won first. She has a nice head and is well formed, but she was in very bad condition, and should have given place to Jean, who was second, or to Fairy, who was vhc. Between these two there was not much to choose, both are nice bitches. We also liked Winnie, who was hc. She has the best head of the lot. She has but just arrived from England, and was all out of condition, and with no coat. She is a little light in bone, but when at her best the others must be in good form to beat her. The puppies were more than an average lot, even the unnoticed ones were fairly good. We thought them well placed.

BULLDOGS.

Tippoo, the only entry in the champion class, is a very good specimen. He has a good skull, ear, stop and chop. He is just a bit pinched in face and a trifle long in body, and was shown too thin. It will take a very good one indeed to beat him when he is at his best. In the open dog class, Boz, a very good one, captured first. There was not much to choose between Hamlet second, and Viscount and Moses, both vhc., all were fairly good. In the bitch class, Sweet Briar had a walk over. She is a good bitch, with rather a plain face and is a little short of lip. She also won the special for the best bull, dog or bitch, Boz being absent on account of sickness.

TERRIERS.

There were no entries in the champion bull-terrier class. There were ten in the open dog class, four in the bitches and two in the puppy class, with only three bull-terriers in the lot. Grand Duke, first in the dog class, is a very fair dog except that he is faulty in stern. Little Maggie is also a very pretty one, with rather a full eye. Fan C. is only fair, the others were a wretched lot of ill-looking, scarred brutes, most of them, judging from their appearance, are well acquainted with the mysteries of the pit. In rough-haired terriers Patsy, a varmint looking customer, deserved his first, the only other entry receiving a c. The black and tan terriers, with the exception of Minnie Warren, were a bad lot. Minnie, who was only a fair specimen, was given vhc., the other awards being withheld. Irish terriers had but one representative, a poor one, and the prize was properly withheld. There were several pretty little silky-haired toys in the Skye terrier class, but not a Skye among them, and no awards were made.

PUGS.

The pugs were also very poor, with not a really good one among them. There were no entries in the champion class. In the open dog class the best one was given a c., which was enough. In the bitch class Beauty won first. She is a nicely-formed little bitch, but smutty in color. None of the others were more than middling.

YORKSHIRE TERRIERS.

There was but one in this class. He was only a moderate specimen.

TOY TERRIERS.

The toy terriers were fair only, and properly placed.

KING CHARLES SPANIELS.

First prize was withheld. Jack, who was given second, is too large and was in bad condition.

ITALIAN GREYHOUNDS.

First should have been withheld in this class also, as the winner, Top, is coarse, although he has rather a nice head.

MISCELLANEOUS CLASS.

In the miscellaneous class, under 25lbs., first went to Mee Too, a very good specimen of the Mexican hairless dog. Moses

a very fair Scotch terrier, winning vhc. Pete, a diminutive hard-haired terrier, said to be as game as a pebble, was given hc., which he well deserved. In the large class a fair wavy-coated retriever was given first. Prince, who won vhc., should have been first; he is a better Dalmatian than we often see. Aside from these there was nothing in the class worthy of notice.

SPECIAL PRIZES.

There were just one hundred special prizes offered. Thirty-four of them were cash prizes ranging in value from $4 to $15. Many of the others were very valuable, and nearly every class received one or more. Unless otherwise specified all of the specials were for the open classes, and their disposition was decided in the regular judging. On account of the prizes offered for the sporting dogs, the management transferred some of the classes assigned to Mr. Mortimer to Mr. Watson. The prize for trick dogs brought out three. Fritz, the winner, is a fair looking pointer owned by Mr. A. C. Collins, Hartford, Conn. Fritz was trained by his owner according to the rules laid down in "Training vs. Breaking," and the very cheerful and intelligent manner in which he went through his performances reflects no little credit upon his trainer, and shows that he has imbibed the true spirit of the system, which we have recommended and so long followed. Prince, a very good Dalmatian, who was entered in the miscellaneous class, was very highly commended for the very creditable manner in which he performed his tricks. There were four entries for the two prizes for the best retrieving dogs. First was fairly won by Dan, a liver pointer owned by Mr. R. H. Meachem, New Haven. Dan did his work in a cheerful manner, and appeared to have a good mouth. Tom II., who was second, is owned by Mr. J. C. Schuyler, Lehighton, Pa. He also performed very well, but did not do his work in so cheerful a manner as Dan. The performances of the trick and retrieving dogs were greatly enjoyed by the spectators. The medals given by the club are very nicely gotten up, and cost more than the money prizes offered at many shows. Following is a full list of the

AWARDS.

Class 1. Champion Mastiffs, Dogs or Bitches.—1st, Charles H. Mason's Nevison, fawn, 4yrs., Gurth—Juno.

Class 2. Mastiffs, Dogs.—1st, J. W. Burgess's Hero II., A.K.R. 545; 2d, Shaw & Bates's Agrippa, A.K.R. 449. High com., William North's Surry, fawn, 18mos., imported. Com., Munson & Pierpont's Romeo II., fawn, 5yrs., imported, Romeo—Juliet.

Class 3. Mastiffs, Bitches.—1st, Shaw & Bates's Dutchess, A.K.R. 260; 2d, Richard W. Meigs's Juno, fawn, 17mos, Turco—Queen. Very high com., D. D. Mangam's Queen, fawn, black muzzle, 16mos., Herald—Dido. Com. E. A. Pierpont's Juno, 1yr.

Class 4. Mastiff Puppies.—Absent.

Class 5. Champion Rough-Coated St. Bernards, Dogs or Bitches.—1st, E. R. Hearn's Bonivard, A.K.R. 361.

Mr. James Mortimer—Fox-terriers, bulldogs, bull-terriers, and collies.
Mr. J. R. Pierson—Greyhounds, Italian greyhounds, and deerhounds.

Judges of other classes will be duly announced.

CHAS. LINCOLN, Superintendent.

MASTIFF TEMPERAMENT AND PECULIARITIES.

Editor Forest and Stream:

Although I have not so far succeeded in eliciting comments from our mastiff fanciers on what I had to say on mastiff temperament in FOREST AND STREAM of Jan. 24, I am pleased to send you the following, from Richard Cook, Esq., honorable secretary of the old English Mastiff Club, England.

W. WADE.

PITTSBURGH, March 6, 1884.

One of my bitches, one morning early, allowed some painters to bring their ladder into my grounds, ready for work, and they then went away to breakfast. Returning, they were about to raise the ladder, when Sylvia said no, and would not allow them to touch it until my man came. Again. Twenty years ago I owned a dog, Warwick. I lived in a house adjoining another. The occupant of the next house had free access to my grounds, there being a gate between them. Mrs. Bell, my adjoining neighbor, frequently fed the dog, and he was as fond of her as possible. For all I knew he considered her as one of the family. One Sunday my wife and I went to take a walk, and as all the servants were absent, I locked the front door, left the back one open, and left Warwick loose. In half an hour Mrs. Bell thought she would take a look over my place to see that all was right, but on coming to the gate between her own and my grounds, War-

wick met her, growling at her fiercely, and would not allow her to come in. I believe that he had been in the house, found it empty, and I know would have guarded it to the death. I left this house when Warwick was ten years old, and left him with my successor. He pined over it very much, and when I called there three weeks after the poor dog was so delighted that in his demonstrations of joy he fell down in a fit, and died three days after. My present dog, Cromwell, is another of similar temperament. RICHARD COOK.

EASTERN FIELD TRIALS CLUB.

Editor Forest and Stream:

A committee has been appointed by the governors of E.F.T.C. to revise and alter the running rules to avoid any repetition of last year's errors, and any person receiving Derby blanks without the running rules, will, by application, have the same sent as soon as they are printed, which will be at the earliest date possible.

Quail have wintered well at High Point, and the prospects, if the spring is favorable, are that the birds will be more abundant than last fall, insuring a short and most successful meeting. WASHINGTON A. COSTER, Sec.

FLATBUSH, N. Y.

MR. D. C. SANBORN.

AT a meeting of the Eastern Field Trials Club at Delmonico's on Tuesday evening, March 11, the following resolutions were unanimously adopted:

Resolved, That the Eastern Field Trials Club has learned with pain of the decease of our esteemed friend, Mr. D. C. Sanborn; that the genial, open, kindly and generous qualities of Mr. Sanborn, united with the influence of his sterling honesty and lofty views of the duties of sportsmen toward the development of field trials, have had a greater influence toward the elevation of the objects for which this and similar clubs were organized than that of any other individual since the establishment of the Association, and that we, in common with the entire community of American sportsmen, have sustained in his decease an irreparable loss.

Resolved, That these resolutions be spread upon the minutes, and that a copy thereof be transmitted to the family of the deceased, with our respectful sympathy in their great affliction.

N. A. K. C. STUD BOOK.

Editor Forest and Stream:

In reply to Mr. James Watson's inquiry in your last issue about the N. A. K. C. Stud Book, I will say that the club entered into a contract with Dr. N. Rowe on Dec. 10, 1881, turning over to him all entries and other material pertaining to said book, he agreeing to publish it for a term of ten years, annually, if necessary, or every two years. This matter was freely discussed at the meeting of the club at Grand Junction last December. Why this part of the proceedings of the meeting was omitted and everything else published, is more than I can tell. In the absence of Dr. Rowe, Mr. Whitford stated that the book was in the printer's hands and would be out early in January. The matter was referred to the executive committee with instructions to see that Dr. Rowe fulfilled his contract without any further delay. I cannot say why the book was not published in January, as I can get no response from Dr. Rowe to any letters on this subject. I trust Dr. Rowe will soon have this much needed book out of the printer's hands. D. BRYSON (Secretary N. A. K. C.).

AMERICAN ENGLISH BEAGLE CLUB.

THE following circular has been sent to the members of the American English Beagle Club:

Gentlemen—Your Executive Committee, to whom was assigned the drafting of a constitution and by-laws for the Club's management, having given the work before them careful consideration, wish to submit for your approval their report as follows: Yours respectfully,

DR. J. W. DOWNEY, J. N. DODGE,
GEN'L F. A. BOND, A. C. KRUEGER,
W. H. ASHBURNER, Chairman.

CONSTITUTION.

ARTICLE I.

NAME.—The Association shall be known as and called "The American English Beagle Club."

ARTICLE II.

OBJECT.—The object of the Club shall be to promote the improvement of the English Beagle Hound in America, by having a proper standard to breed to, and of having our Bench Show Managers adopt the same for guidance in judging, also having proper judges selected at our bench shows, and the following classes assigned to the Beagle Champion: Dog and Bitch, and Puppy open, also a class for Basket or Foot Beagles under twelve inches.

ARTICLE III.

MEMBERS.—A person to be a member must be recorded in a book provided for the purpose by the Secretary. The date of his becoming a member, also the time of his ceasing to be such shall be recorded. Any member can resign from the Club by sending his resignation to the President or Secretary, in writing, and upon the acceptance of such, all his interest in the property of the Club ceases from the date of such resignation. A member whose dues shall remain unpaid for six months after the same have become due shall cease to be a member and forfeit to the Club all claims and benefits to which he would have been entitled as a member, provided that the Executive Committee may consider his case, and upon sufficient cause shown reinstate him to membership on payment of his dues. Any member acting contrary to the provisions of the Constitution or in violation of the By-Laws or Rules of the Club, or in any way which may tend to the injury or destruction of the Club, or neglecting his duty as an officer or a member or being convicted of crime in a court of justice, may be expelled and shall forfeit to the Club all dues paid, all property claims and benefits to which he would have been entitled as a member of the Club. A member can be expelled only by a vote in favor of his expulsion of two-thirds of the members after thirty days notice has been given to him personally of the charges against him, when action will be taken thereon by a vote.

ARTICLE IV.

OFFICERS.—The officers shall consist of a President, a Secretary and Treasurer and an Executive Committee, said committee to consist of three active members, whose duty shall be as the by-laws prescribe. Any vacancies occurring in the said committee shall be filled by appointment of the President. Should the office of President or Secretary and Treasurer be vacant, the same shall be filled by appointment of the Executive Committee. All appointments so made as above to hold good only until the yearly election next following such.

ARTICLE V.

ELECTIONS.—An election of officers of the Club to serve one year shall take place annually in January, and a majority of the votes cast for a candidate shall elect him.

ARTICLE VI.

MEETINGS.—As it is not practical to have meetings, as the members are situated so far apart, they will be informed from time to time by circulars of the working of the club, or by writing to the Secretary or any member of the Executive Committee.

ARTICLE VII.

COMPENSATION FOR SERVICES.—The President, the Secretary and Treasurer and the Executive Committee, also Special Committees, shall receive no salary from the club for his or their services.

ARTICLE VIII.

AMENDMENTS.—The Constitution and By-Laws may be amended or altered by a vote in favor thereof of two-thirds of the members after notice thereof with a copy of the proposed amendment or alteration has been sent to every member ten days before voting thereon.

BY-LAWS.

1. PRESIDENT.—It shall be the duty of the President to assume general supervision of the affairs of the Club and report from time to time to enforce the observance of the By-Laws and he may vote on amendments to the Constitutions or alterations of the By-Laws, also on the expulsion of a member, but on all other matters shall vote only in the case of a tie, and then give the casting vote.

2. SECRETARY AND TREASURER.—It shall be the duty of the Secretary and Treasurer to have charge of all official correspondence to keep copies of all letters sent by him, and file such as he may receive, to correspond at the request of the President or Executive Committee on all matters appertaining to the object of the Club. To keep a record of the members, their admissions and discontinuances. To collect and receive all money and dues to the Club, and keep a correct account of the same. He shall pay all orders drawn on him by the Executive Committee out of the funds of the Club in his hands when countersigned by the President and to present a report of the condition of affairs in his department every six months to the Club.

3. EXECUTIVE COMMITTEE shall have charge of the property and effects of the Club, keeping a correct inventory thereof. They shall receive and take charge of all gifts of books, pictures or works of art, specimens of natural history, etc. They shall make all purchases ordered by the Club, audit the accounts of the Treasurer and report the same at the time of the Annual Election in January, and transact all business not otherwise herein ordered. They shall provide a book in which shall be kept the proceedings and orders of the Committee. They shall have power to appoint Sub Committees for any special object, and to delegate to such Sub Committees the powers and functions of the Committee relating thereto. The President shall be the Chairman of the Executive Committee.

4. FINANCES.—The Finances of the Club shall be under the care and management of the Executive Committee.

5. ANNUAL DUES.—The Annual Dues shall be two dollars, due and payable at the time of a member joining the Club, and shall be paid from the date of his joining yearly.

You will please notify the Secretary not later than March 21, if you vote for accepting the above for the management of the Club or not. A. C. KRUEGER, Secretary and Treasurer.

WRIGHTSVILLE, York County, Pa.

THIRTY YEARS AGO.—Philadelphia, Pa.—*Editor Forest and Stream:* I notice in your last issue an item from Oxford, Me., concerning a hound being killed by a locomotive while crossing the track, close behind a fox. A parallel case occurred over thirty years ago on the Boston & Albany Railroad, near Chester, Mass. The train was ascending a grade, and somewhat slowly, when the engineer saw a large fox cross the track a few yards ahead, closely followed by a hound. The fox disappeared in a thick growth of bushes, soon doubling and coming out directly abreast of the locomotive, and ran alongside of it till the hound was nearly upon him, when he suddenly forged ahead and crossed close in front of the cowcatcher, which struck and killed the hound as he attempted to follow.—MILTON P. PEIRCE.

GORDON JUDGING AT NEW YORK.—The Westminster Kennel Club have written to Mr. H. Malcolm, of Baltimore, Md., the following letter: "New York, March 1, 1884.—H. Malcolm, Baltimore, Md. Dear Sir—The managers of the W. K. C. show have resolved upon striking out the clause in the rules which announces that the judges will be requested to make their decisions in conformity with "Stonehenge," etc. As they have always declined to pass upon a decision which did not seem to be in accordance with that request, the rule has been practically a dead letter. They will, however, be glad to hand to the judges the standard adopted by your society, and no doubt the judges will be influenced thereby.—(Signed) ROBT. C. CORNELL (Sec. W. K. C.).

WASHINGTON SHOW.—The Washington bench show bids fair to be as fine an exhibition as that held here last year. Attorney-General Brewster and other prominent gentlemen will enter some fine dogs. I understand the entries number somewhat over 300. There will be a good display of deerhounds. The number of foxhounds and beagles will be small. —HOMO.

TORONTO DOG SHOW.—The bench show to be held at Toronto, Ont., next week, will undoubtedly be first-class in every respect. In addition to the very liberal prize list, more than fifty special prizes have already been offered to the different classes; many of them are valuable, and the list is not yet complete, as several more have been promised.

THE WATERLOO CUP.—The Waterloo coursing meeting was held at Altcar, near Liverpool, Eng., Feb. 20, 21, 22, the final heats resulting as follows: Waterloo Cup—Mineral Water first, Greenick second; Plate—Cocklaw Dean first, Cyril second; Purse—Escape and Gladys divided.

BLUE CARP.—The North German Lloyd steamer Werra, arrived on Saturday last, and brought forty blue carp for the United States Fish Commission. They are said to be an improved kind.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Glenfinlass. Mr. T. G. Davey's (London, Ont.) English setter bitch Glenfinlass (A.K.R. 588), March 7, eight, by his Prince Phœbus (A.K.R. 597).

Clio. Mr. J. S. Brown's (Montclair, N. J.) liver and white pointer bitch Clio (Sensation——), Feb. 23, eleven (four dogs) by Mr. A. E. Godefroy's Lord Sefton (Croxteth—Vinnie); three bitches since dead.

Countess Mollie. Mr. Peter Moeller's (Nyack, N. Y.) English setter bitch Countess Mollie (Count Noble—Spark), Feb. 27, nine (eight dogs), by the late Mr. D. C. Sanborn's Gus Bondhu.

Beauty. Mr. Henry Sturtevant's (Medina, N. Y.) imported English setter bitch Beauty (A.K.R. 806), Feb. 16, seven (four dogs), by his Perfection (A.K.R. 826).

Viola. The Surrey Kennel's (Ellicott City, Md.) pointer bitch Viola (A.K.R. 703), March 4, six (five dogs), by Mr. C. H. Mason's Beaufort (A.K.R. 694).

Bridget O'More. Major Lovejoy's (Bethel, Me.) red Irish setter bitch Bridget O'More (A.K.R. 564), March 14, eight (five dogs), by his Ned Elcho (A.K.R. 984).

Daisy. The Chequasset Kennel's (Lancaster, Mass.) imported pug bitch Daisy (A.K.R. 468), March 3, six (four dogs), by their imported Young Toby (A.K.R. 475); two dogs since dead.

Music. Mr. N. Elmore's (Granby, Ct.) imported beagle bitch Music (Rockwood—Faithful), Feb. 9, four (one dog), by his King; all white, black and tan.

Gyp. Mr. W. W. Hurd's (Colebrook River, Ct.) black and tan foxhound bitch Gyp, March 13, thirteen (nine dogs), by Griswold's Colonel.

Modesty. Mr. J. W. Munson's (St. Louis, Mo.) liver and white pointer bitch Modesty (Croxteth—Trinket), March 13, seven (three dogs), by his imported Bang (champion Bang—Luna); all liver and white.

SALES.

☞ *See instructions at head of this column.*

Joe. Fawn pug (A.K.R. 925), by Mr. Jas. Mortimer, New York, to Mr. Geo. H. Hill, Cincinnati, O.

Trim. Gordon setter dog, whelped Oct. 22, 1883, pedigree not given, by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. F. T. Seward, McKean, Pa.

Kate Claxton. Liver and white English setter bitch, age not given (Guy Mannering—Flash), by Dr. Robt. I. Hampton, Athens, Ga., to Mr. A. J. Crovatt, same place.

Belle Rita. Liver and white pointer bitch, whelped Dec. 22, 1883, by Baronet (A.K.R. 264) out of Rita Croxteth (A.K.R. 168), by Mr. George L. V. Tyler, West Newton, Mass., to Mr. N. P. Warren, Newtonville, Mass.

Lee. Black, white and tan beagle dog, whelped 1877 (Warrior—Rosey), by Mr. R. M. Lindsay, Scranton, Pa., to Mr. Pottinger Dorsey, New Market, Md.

Fannie. Black, white and tan imported foxhound bitch Fannie, by Mr. B. R. Houghton, Boston, Mass., to Mr. W. C. Crandall, Springville, N.Y.

Dick Laverack. Blue belton English setter dog, 4½yrs. old (Thunder—Peeress), by Mr. H. Bailey Harrison, Tilsonburg, Ont., to Mr. T. G. Davey, London, Ont.

Belle's Pride. Blue belton English setter bitch, 4½yrs. old (Paris—Belle), by Mr. H. Bailey Harrison, Tilsonburg, Ont., to Mr. T. G. Davey, London, Ont.

Genevieve. Blue belton English setter bitch, 23mos. old (London—Dawn), by Mr. H. Bailey Harrison, Tilsonburg, Ont., to Mr. T. G. Davey, London, Ont.

Peek-a-Boo. English setter bitch (A.K.R. 825), by Mr. Henry Sturtevant, Medina, N. Y., to Mr. Ricardo B. Smith, Washington Heights.

Rush P. White pointer dog, whelped July 29, 1883 (Nip—Josie), by Mr. L. F. Patterson, Bainbridge, Ga., to Mr. G. W. Mroczkowski, same place.

Dick. Setter dog, by Joe (Check II.—Pink) out of Nellie (Frank—Kate), by Mr. J. W. Trantum, Middletown, Ct., to Major Lovejoy, Bethel, Me.

David O'More. Red Irish setter dog, whelped March 29, 1883, by Ned Elcho (A.K.R. 984), out of Bridget O'More (A.K.R. 964), by Major Lovejoy, Bethel, Me., to Mr. J. W. Trantum, Middletown, Ct.

Hornell Obo. Imported black cocker spaniel dog, age not given (Obo—Nellie), by Mr. G. W. Leavitt, Boston, Mass., to Mr. J. P. Willey, Salmon Falls, N. H. Price, $450.

Fun. Fawn pug bitch (A.K.R. 469), by the Forest City Kennel, Portland, Me., to the Chequasset Kennel, Lancaster, Mass.

Don. Fawn pug dog (A.K.R. 704), by the Forest City Kennel, Portland, Me., to the Chequasset Kennel, Lancaster, Mass.

Pan. Fawn pug bitch (A.K.R. 469), by the Chequasset Kennel, Lancaster, Mass., to Mr. Francis Lynch, Newburgh, N.Y.

Chum. Smooth-coated St. Bernard dog, whelped June 17, 1882 (Rex—Brunhild, A.K.R. 28), by the Chequasset Kennel, Lancaster, Mass., to Mr. F. Louis Mahler, Raleigh, N. C.

Ringwood—Silver whelps. Beagles, whelped Nov. 12, 1883, by Mr. N. Elmore, Granby, Ct., a dog to Mr. I. I. Lanty, Mole Hill, W. Va.;

a dog to Mr. Chas. F. Beard, Boston, Mass.; a dog to Mr. Joseph W. Gross, Harrisburg, Pa., and a bitch to Mr. Frank Lynch, Newburg, N. Y.

King—Mary whelp. Beagle bitch, whelped Nov. 11, 1883, by Mr. N. Elmore, Granby, Ct., to Mr. I. I. Lanty, Mole Hill, W. Va.

Ringwood—Belle whelp. Beagles, whelped Nov. 13, 1883, by Mr. N. Elmore, Granby, Ct., a dog to Mr. Geo. E. Drew, Rochester, N. H.; a dog to Mr. Haven Doe, Salmon Falls, N. H., and a bitch to Mr. W. Hamersley, St. Leonard, Can.

Ringwood—Bush whelp. Beagle dog, whelped, Nov. 28, 1883, by Mr. N. Elmore, Granby, Ct., to Mr. Frank Lynch, Newburg, N.Y.

Ringwood—Music II. whelp. Beagle dog, whelped Nov. 21, 1883, by Mr. N. Elmore, Granby, Ct., to Mr. J. Lingsham, Plantsville, Vt.

Bang—Spinaway whelps. Pointers, whelped Jan. 9, by Mr. J. W. Munson, St. Louis, Mo., a lemon and white pointer dog to Mr. B. P. Halliday, Prairie, Miss.; a liver and white bitch to Vaiden & Houston, Unlontown, Ala.; a liver and white bitch to Mr. J. W. Blythe, Burlington, Ia.; a liver and white bitch to Mr. C. B. Whitford, Chicago, Ill.; a liver and white and a lemon and white bitch to Mr. W. S. Titus, Memphis, Tenn.

Ringwood—Myrtle whelp. Beagle bitch, whelped Nov. 26, 1883, by Mr. N. Elmore, Granby, Ct., to Mr. Jos. W. Gross, Harrisburg, Pa.

Dan. Orange and white pointer dog, age and pedigree not given, by Mr. Thomas M. Smith, Jersey City, N. J., to Mr. Peter Kelley, New York.

Croxteth—Spinaway whelp. Liver and white pointer bitch, age not given, by Mr. J. W. Munson, St. Louis, Mo., to Dr. N. B. Carson, same place.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Zero. Lemon and white pointer dog, whelped Dec. 23, 1883, by Baronet (A.K.R. 264) out of Rita Croxteth (A.K.R. 168), by Mr. Geo. L. V. Tyler, West Newton, Mass., to Mr. Forest W. Forbes, Westboro, Mass.

Roscoe. Lemon and white setter dog, age and pedigree not given, by Mr. Edward Odell, New Orleans, La., to Mr. J. T. Haidie, same place.

May. Pointer bitch (A.K.R. 211), by the Surrey Kennel, Ellicott City, Md., to Mr. N. Dorsey, same place.

DEATHS.

☞ *See instructions at head of this column.*

Vinnie II. Liver and white pointer bitch (A.K.R. 466), owned by Mr. C. R. Squire, Troy, N.Y., March 9, from poison.

Kathleen Mavourneen. Red Irish setter bitch (A.K.R. 617), owned by Mr. C. R. Squire, Troy, N.Y., March 1, from distemper.

Smoke Morrissey. Red Irish setter dog (A.K.R. 622), owned by Mr. C. R. Squire, Troy, N.Y., March 3, from acute pneumonia.

Lady Elcho. Red Irish setter bitch (A.K.R. 978), owned by Mr. C. R. Squire, Troy, N.Y., March 8, from distemper.

Daisy. Imported pug bitch (A.K.R. 468), owned by the Chequasset Kennel, Lancaster, Mass., March 8.

Bang—Spinaway whelps. Two pointers, whelped Jan. 9, owned by Mr. J. W. Munson, St. Louis, Mo., March 9, from worms.

Stunner. Lemon and white pointer dog (A.K.R. 218), owned by the Westminster Kennel Club, New York.

Brimstone. Liver and white pointer dog, whelped Aug. 24, 1883 (Tory—Moonstone), owned by the Westminster Kennel Club, New York.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

W. F. T., Altoona, Pa.—We could not intelligently prescribe for your dog without a full description of symptoms. He may have received an injury to his spine, or his trouble may be a sequence to distemper. Write, giving all particulars.

E. H., Ottawa, Can.—Your dog probably has an attack of distemper. Keep him in a dry and well-ventilated place, and nurse him carefully. Write a full description of symptoms should he not improve.

Rifle and Tray Shooting.

FIXTURES.

First International Clay-Pigeon Tournament, at Chicago, Ill., May 26 to 31. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.

RIFLES OF TO-DAY.

THE BULLARD REPEATING ARM.

THE Bullard is one of the latest models added to the collection of rifles now in use, and as yet can hardly be said to have entered very largely into the arena of competition. Very flattering words have been said of it; a few good scores have been made, and it has many warm friends. What it is and what it looks like the accompanying cuts will show.

It is the invention of Mr. J. H. Bullard, and the story of its birth is a very brief one. Mr. Bullard had for several years held the position of master mechanic at Smith & Wesson's pistol factory in Springfield, Mass. In 1879 the works were visited by a prominent Chinese official, and a conversetion upon pistols and rifles took place between the American mechanic and the visiting Mongolian. The latter put the question, "Why the repeating rifles of the day were so weak in their mechanism, and if one could not be invented which would shoot the heaviest charges with perfect safety." Mr. Bullard said he knew of no mechanical difficulty, and at once set to work thinking and model making. A test rifle was made embodying the parts, which, in the opinion of Mr. Bullard, met the Chinaman's question. It was subjected to the severest tests and criticisms, and came out of the trial with no signs of weakness and with the most flattering opinions of the experts and critics who had been invited by the inventor to witness the experiments.

The patents covering the invention were issued on Aug. 16, 1881, and the Bullard repeater of to-day is almost precisely like the first model as designed in 1879. A joint stock company, known as the "Bullard Repeating Arms Company," has been formed, in which Mr. J. H. Bullard, H. H. Bigelow and a third and silent partner are said to hold ninety-five per cent. of the stock. Land has been secured at Springfield, Mass., and a brick factory structure 109×67 feet in area and practically four stories in height, has just been completed. There are three machine rooms, each 40×125 feet, the woodworkers' department being in the attic story. There is a very complete outfit of the accurate machinery needed in the making of such a fine bit mechanism as a repeating arm, and besides there is a complete set of special fixtures and tools designed and invented by Mr. Bullard.

The general appearance of the Bullard rifle is already familiar to readers of the FOREST AND STREAM through the illustrations in the advertising columns. Fig. 1 shows the complete rifle. It is one of the class of rifles having a tube magazine arranged below the barrel. There is a bolt action in opening the breech and in bringing up the next cartridge from the magazine, but there is a peculiarity of construction in locking the breech and bringing the striking pin into range, which can be easily studied through Figs. 2 and 3, showing respectively the action closed and open. In Fig. 2, A, the breech block, is held firmly in place by brace C, which is pivoted and cradled on hammer pin and lock frame; C is brought into place and firmly held by links B, which are on either side, only one being shown in section, and which are connected by strong pins to guard lever D. It will be seen that it is impossible to get the hammer to reach the firing pin until the brace C is in its proper place and the line of recoil carried back to the hammer pin and in that way distributed to the lock-frame and stock. A claim made in this connection is that there are no sliding surfaces as all the parts are pinned and hinged together. The action is a positive one, not dependent upon springs. Care has been taken to have the material used the very best throughout, no iron or malleable iron being used, all being of forged steel except the carrier, which is composition or gun metal.

The magazine is charged from the under side, and it can be done with equal facility by a right or left-handed person. And as there are no holes or spring covers on the side, it is not likely to become clogged by passing through brush or laying it on the ground or in trenches, etc. It is also easy to load on horseback with the magazine opening below the arm. It can be loaded as a single-loader either from or bottom, leaving the magazine full at all times for an emergency.

"It is possible," says Mr. Bullard, "to fire the Bullard rifle with greater rapidity than any other repeating rifle, from the fact that it works easier and smoother by reason of its more direct leverage on the work to be done, the heaviest work being done with the best leverage, as in extracting the cartridge, which is started when the lever is in position to exert the greatest strain. Cocking the hammer is also done by direct leverage inside the receiver or frame instead of a sliding motion of bolt or firing-pin on and over the top of hammer, which is very often liable to grind, and always makes the arm work hard and unpleasantly." The Bullard has been fired in tests as rapidly as twelve shots in five seconds.

The Bullard, it is claimed, is the only lever repeater that will successfully use the regular United States copper cartridge (.45-caliber 70 grains powder), owing to its absolute certainty to extract the shell, which being made of copper and with a folded head, does not contract after firing (as is the case of brass shells) but often sticks in the chamber, a difficulty more frequently mentioned in reports of trials of breechloading firearms by government experts, than any other. Another advantage in using the U. S. cartridge is, that it is the standard ammunition and can be obtained anywhere in the country. This point will be appreciated by frontiersmen.

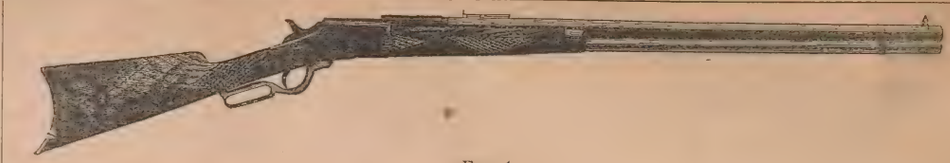

FIG. 1.

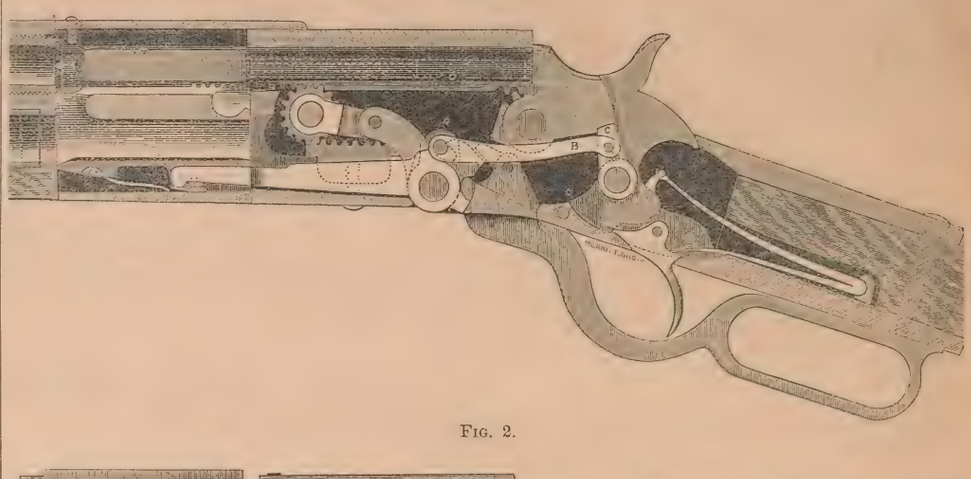

FIG. 2.

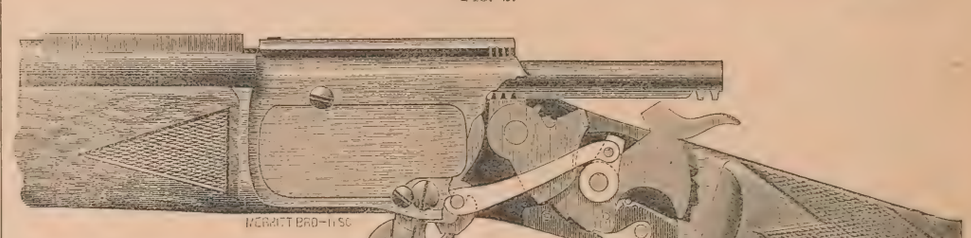

FIG. 3.

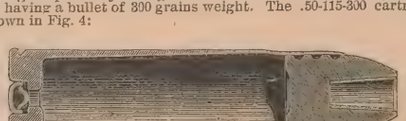


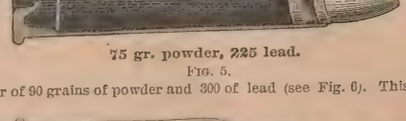
In loading the arm, it is only necessary to carry the lever forward as far as it will go and then insert the cartridge in the magazine through the opening under the carrier. To use the arm as a single-loader, carry the lever as far forward as is necessary to extract the spent shell, remove the shell and insert another cartridge in the chamber of the gun, or carry the guard lever as far forward as it will go, and insert another cartridge in the magazine through the opening under the carrier.

The arm is not a difficult one to dismount, if that be found necessary. To do so the following directions should be observed: 1, Take out tang screw; 2, half cock hammer and take out lock-frame and hammer screws; 3, pull out lock-frame, down and backward; 4, disconnect links from brace; 5, take out side plate screws and remove side plate; 6, remove carrier lever spring; 7, take out breech-bolt; 8, take out breech-block; 9, take out extractor pin and remove extractor, push back pin before removing bolt; 10, take out guard lever bolt; 11, draw out guard lever and its connections; 12, draw out carrier lever; 13, take out carrier. To assemble reverse these operations.

To remove the barrel, take out magazine plug screw and the two tip screws, pull out the magazine tube and take off the fore-arm. If the bolt has not been previously removed, pull it back so as to prevent the breaking of the extractor while unscrewing the barrel.

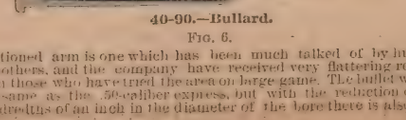
The record of the Bullard is at present not a very extensive one, and but few trials of it have been made at the target in formal matches. Three riflemen have made scores up to 111 and 113 points in the possible 120 at 200 yards on the Massachusetts target, with open military sights. At Creedmoor the arm is comparatively unknown.

The number of models made by the Bullard Company is quite large. Among the .50-caliber models there are three different sizes, carrying respectively charges of 95, 105 and 115 grains of powder, each having a bullet of 300 grains weight. The .50-115-300 cartridge is shown in Fig. 4:



115 gr. Bullard Express.

FIG. 4.



The .45-caliber group of Bullard rifles also include three different sizes, one using the government cartridge, with 70 grains of powder and 500 of lead, another with the same powder charge and 405 grains of lead. The former to be used in single loading and the latter in the magazine. The remaining .45-caliber is one of 85 grains of powder and 285 grains of lead. This proportion gives a very low trajectory, and experiments at the Bullard armory show a rise it is claimed of but 9 inches in 200 yards.

The .40-caliber rifles include one of a 60-grain powder charge, another with a 75-grain charge behind 225 of lead (see Fig. 5), and another of 90 grains of powder and 300 of lead (see Fig. 6). This last-mentioned arm is one which has been much talked of by hunters and others, and the company have received very flattering reports from those who have tried the arm on large game. The bullet weighs the same as the .50-caliber express, but with the reduction of ten hundredths of an inch in the diameter of the bore there is also a reduction of the atmospheric resistance in a greater proportion, giving this bullet great penetrative power, as well as greater range. The weight of these rifles, including the .50-caliber express, is 9¾lbs. to 12lbs. The .38-calibers will be ready by May 1, and will comprise two cartridges of 40 and 60 grains of powder in each. Thirty-two-caliber rifles will probably come at about the same time, and include .32-cartridge of 20 grains and Farrow's express shell of 45 or 50 grains.

75 gr. powder, 225 lead.

FIG. 5.

40-90.—Bullard.

FIG. 6.

Our object in giving full information for the benefit of our readers would stop short if the rates of charges upon these several arms were not given. The .45-70, .45-75, .45-60 and .40-60, round barrel, 28in., carrying 11 shots, with plain stock, open sights, graduated for 1,200yds., cost $33; half octagon and full octagon barrels running $2 higher. The .50-95 express, 27in., round barrel, with full or short magazine, costs $40, and with half octagon barrel, $42; 105 and 115-grain express, same style and finish, $5 extra. The 38-caliber, 24in. round barrel, with 16-shot magazine, costs $27, and with half octagon barrel, $29. The .38 caliber special .38-50-200, costs, with 26in. round barrel, 11-shot magazine, $30, either short or full magazine.

In connection with their arms and under instructions to purchasers Mr. Bullard gives some plain directions in reference to some important points of reloading, which it were well for all who act as their own cartridge makers should mind. He says that all shells, as soon as possible after being fired, should be cleaned and washed out carefully with strong soap suds or soda water and thoroughly dried, otherwise the deposit of nitric acid left on them after firing causes them to oxidize rapidly, and they become worthless. The primer should always be pressed down so that it is sure to be lower than the head of the cartridge shell. Use American Powder Company's Dead Shot, FG; or, Hazard Powder Company's Sea Shooting, FG; or, Orange Rifle (Laflin & Rand Powder Company) FG.

Use for bullets one part tin to sixteen of lead, and keep the molds very hot and the handles of the molds tight together. It often happens that the handles become too hot for comfort and are not held together properly. The result is a bullet that is not round and one that will not fit the shell. See that the grooves of the bullets are filled with beef tallow or Japan wax, wipe off all surplus greese before loading. When pressing the bullet into the shell, see that it is forced into the chamber of the reloading tool as far as it will go. He recommends, however, that all sportsmen buy their bullets of cartridge manufacturers, as they are all swaged by powerful machinery and are far more perfect than it is possible to cast them.

RANGE AND GALLERY.

BOSTON, March 15.—There was a fair attendance of riflemen at the Walnut Hill range to-day, those present shooting under difficult weather conditions. The scores were:

Creedmoor Practice Match.

GALLERY PRIZES.—An all comers match will open at the Grand Central Rifle Range, No. 5 Vanderbilt avenue, on Thursday next, and remain open till April 26. Cash prizes aggregating $100 are offered. Seven shots per entry at Creedmoor Everbaugh ring target, best five scores to count. Entries unlimited, 25 cents each.

FIRST GERMAN GUN CLUB OF NEW YORK.—The annual election of officers of the above club took place March 12 at the club's rooms, 384 Pearl street. The following gentlemen were elected: Henry Zahn, President; Leopold Maisch, Vice President; Fr. Wm. Pfaender, Secretary; Fr. Jenner, Treasurer.

ZETTLER CLUB.—Regular weekly shoot March 11, gallery distance: M. Dorler 116, C. G. Zettler 113, A. Lober 114, D. Miller 110, M. B. Engel 115, P. Fenning 115, B. Zettler 113, J. Adrien 106, H. Horges 109, G. Schurmann 95, W. Vondertleinden 111, N. D. Ward 102, T. C. Noone 97, V. Stevibock 109, H. Oehl 114, C. Joison 113.

NEW YORK.—Regular weekly shooting of the Bullshead Rifle Club, 222 Third avenue, March 6. 12-ring, possible 120: C. Rein 119, H. Holzmann 115, A. Lober 115, G. Zimmerman 114, H. Hackmann 113, H. Gunther 112, B. Walters 109, S. Mehrbach 109, D. Holland 104, D. Loumskie 82.

ALBANY, N. Y., March 13.—The second competition in the American decimal match was shot at Rensselaerwyck to-day. Scores were made as follows:

Wm E Fitch	8	9	9	9	10	9	9	10	9	9—91
B R Spelman, Jr	8	10	10	8	8	8	9	10	9	6 9—90

THE LIGOWSKY TOURNAMENT.—President Barbour, of the Louisville Sportsman's Association, writes as follows to the Ligowsky Company, touching the Chicago gathering of May. Under date of March 12, Mr. Barbour says: "Your circulars of March 15 received, and I note some good changes made, I refer particularly to county team rules. My idea is that any member in good standing in a club at the time you offered this match to the different clubs of the country, should be allowed to shoot with his club team no matter where he is living, whether in the same country or not, but I do not think any member joining a club since you offered this match should be allowed to shoot in their club team. This would shut out clubs from electing members for the special purpose of making team, and if left to your executive committee, I think they will so decide. Don't understand me as wanting to meddle in this matter, I only make these suggestions in the interest of the success of this great match. There is another point I think you have made a mistake in, that is in allowing the first entry the very great advantage of naming the time they shall be called to the score, that should be determined by lot, and would give more satisfaction. I will do all in my power to make your tournament a success, and I think that is already assured, I am receiving entries every day for our champion cup match. I think every State in the Union will be represented in this match. The Southern boys are coming in force. I will endeavor to get them to come up in time to go with me up to Chicago to your shoot. Our club will be represented in the meeting called in the interest of forming a national association."—J. M. Barbour, President L.S.A.

WORCESTER, Mass., March 4.—This afternoon there was a meet at the South End Range of members of the South End and Woodlawn Gun Clubs. The occasion was the first of a series of team matches. There were some fifty spectators present. The judges were W. S. Perry for the South End Club, and E. S. Knowles for the Woodlawn Club, O. A. Benoit referee. There were five on a side. Twenty glass balls were thrown for each man, in strings of five each. The following is the result:

South End Club.

Webber	1111111011111111010—17
Whittaker	1101111111010111011—16
Whittier	0111011011111100111—15
Jewett	0100011111001101101—12
Dam	1111101000110100100l—11—71

Woodlawn Club.

Fuller	0011101100101001101—11
Moscroft	1010100000100001111— 9
Rice	0001110111111100101—13
Gilman	0011111161100091001—11
Togus	0101011001100101010111—11—55

March 12.—Second match of the series:

South End Club.

Davis	1101111010110111101—15
Webber	1030110110111110111—14
Whittier	0001001111100110001— 9
Whittaker	1101010001101011011—12
Jewett	0101001101100101111—13—63

Woodland Gun Club.

Rise	0101101010111110111—14
Gilmon	1111111001011111011—15
Togus	1111010111011010101—14
Fuller	1111110111111110111—18
Moscroft	1111111600111110110—15—77

Each club has now won one match. The closing one will be shot on Thursday next on the grounds of the Sportsman's Club.

EAST PROVIDENCE, R. I., March 11.—The weather to-day was most favorable for the shoot of the Watchemoket Gun Club. For the clay-pigeon cup the following was the score, best out of a possible twenty clay-pigeons, ten singles and five pairs of birds:

E W Tinker	1001101010	10	01	10	10	00— 9
C M Sheldon	1000100110	11	00	10	01	11—11
F Wehoskey	1111101110	10	11	00	10	01—13
E S Luther	1100110111	10	00	11	11	11—14
F E Tingley	0101110000	10	10	10	10	00— 8
C C Gray	1101001100	10	10	10	00	01— 9
C P Payne	0111011011	11	10	10	00	00—11
M B Cornell	1110011010	10	10	10	10	10—11
Isaiah Barney	1111111110	11	10	11	10	11—17
George F Butts	0100111111	00	10	11	10	10—12
A F Saulsbury	1100110001	11	00	10	01	10—10

The cup was awarded to Isaiah Barney for the first time. George Barney won the glass-ball cup, having won it for the fifth time, the other contestants on this occasion withdrawing after shooting at ten balls each. On this occasion he made 18 out of a possible 20, and he has broken in the five contests 89 out of 100.

COLLEGE MARKSMEN.—The Harvard Shooting Club had a meet at Watertown, Mass., on the afternoon of March 14, and shot seven matches under the direction of Mr. W. H. Slocum, '86; scoring by Mr. S. C. Jones. The following is a summary of the events:

Match 1, 5 glass balls—First, W. L. Allen, '85, Palmer, '87, E. J. Sartelle, '85, and W. H. Slocum, '86; second, W. Austin, '87, Frye, '86.

Match 2, 15 glass balls, Walnut Hill cup match—First, W. H. Slocum, '86, 13 balls; second, E. J. Sartelle, '85, 12 balls.

Match 3, 5 clay-birds—First, F. Austin '86, W. Austin, Frye, Palmer; second, Foster, S. S. Payne, '84, Sartelle, Slocum.

Match 4, 5 clay-birds—First, Payne; second, Batten, '85, F. Austin, W. Austin, Frye, Palmer, Sartelle and Slocum.

Match 5—First, W. Austin, Sartelle, Slocum, Foster, Frye.

Match 6—First, Frye; second, T. Austin, Slocum.

Match 7—First, Allen, T. Austin, Frye; second, Palmer, Slocum.

The next meet was set for March 19.

STATEN ISLAND GUN CLUB.—The Staten Island Gun Club met at Delmonico's on March 4, pursuant to regular call, and discussed plans for future attractions. The treasurer offered a handsome cup to be shot for at ten birds each man, 30yds. boundary; present handicaps to be shortened 2yds. for the event. Two valuable silver cups were offered by members to be shot for on conditions to be announced later. A committee was appointed to issue a challenge to the Carteret Gun Club for a team shoot. Conditions: Five men from each club, 30yds. rise, 20 or 25 birds each man, to be shot on the grounds of the S. I. G. C. The meeting was a large and enthusiastic one, and from the expressions of interest in the club and the number of private matches arranged during the evening, the club's prospects would seem never to have been brighter.—Governor.

NARRAGANSETT GUN CLUB.—Providence R. I., March 6.—The weather was beautiful to-day, the first and only spring day we have had thus far, and as a consequence the boys turned out in force. The Watchemoket, Union and Mashapaug Gun Clubs being represented. The next shoot will probably take place at Pawtucket, when we shall try to bring the badge home again.

Ligowsky State badge, 25 clay-pigeons, 15yds., 5 traps, one barrel only.

C B Payne, Union G. C., of Pawtucket	25
E W Tinker, Narragansett G. C., of Providence	22
L M Eddy, Narragansett G. C., of Providence	22
E S Luther, Watchemoket G. C., of East Providence	21
C M Sheldon, Narragansett G. C., of Providence	21
C C Gray, Narragansett G. C., of Providence	21
F O Wehoskey, Narragansett G. C., of Providence	20
Mr. Mathewson, Narragansett G. C., of Providence	20
C H Perkins, Jr., Narragansett G. C., of Providence	19
C B Potter, Narragansett G. C., of Providence	19
James Payne, Union G. C., of Pawtucket	19
A Salisbury, Union G. C., of Pawtucket	15
J E Bourne, Watchemoket G. C., of East Providence	13
Mr. Cornell, Mashapaug G. C., of Cranston	11

Same day, club badge:

E W Tinker	11	00	10	10	11	11	00	11	11	10—13
C H Perkins, Jr	11	10	10	11	10	00	10	01	10	11—12
C B Potter	10	10	10	10	11	11	01	01	00	10—12
C B Payne	11	01	11	10	10	11	01	00	10	01—12

C C Gray	10	11	00	10	11	00	00	11	00	11—10
Mr Cornell	00	10	00	00	00	11	00	11	10	01— 7

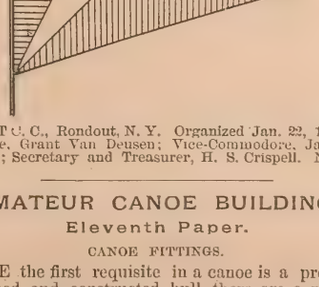
TORONTO, Ont., March 8.—The clay-pigeon shoot on the bay to-day was attended by about 200 interested spectators. Twenty-one shot in the contest. This was the third shoot for a gold medal, which is to be won three times by the same shooter. Mr. Worden was first winner, Mr. Crothers second, and Mr. Cockburn took it to-day, each with a score of 7 out of 10. The following was the full score:

Cockburn	7	Forman	4
Stelsted	6	Greenwood	4
Martin	6	Mallett	3
Martin	6	Lalor	3
Crothers	5	Dangerfield	3
Treblecock	5	Pearsall	3
Briggs	4	Armstrong	3
Robinson	4	Turner	3
Townson	4	Townson	3
Urwin	4	Quest	3
Pearsall	4		

Mr. Black acted as referee.

WASHINGTON, March 5.—The fifth annual meeting of the Capital City Gun Club was held this evening. The following officers were elected for the ensuing year. E. L. Mills, President; J. E. Hosford, Vice-President; F. B. Farnsworth, Secretary; C. M. Taylor, Treasurer; W. B. McKelden, fifth member of the Executive Committee. The club has a membership of forty-four, and is in a flourishing condition. —J. E. H.

WELLAND, Ontario, March 14.—In the shooting match here to-day between George Rogers, of St. Catharines, and Capt. Ritter, each broke 30 glass balls straight, and they continued shooting until Rogers missed, Ritter winning. In the pigeon match of 15 birds each between the same men, Rogers shot 13 and Ritter 12.



Canoeing.

FIXTURES.

Winter Camp-fire.—Sixth meeting, Wednesday, April 2, 8 P. M., No. 23 East Fourteenth street.

Secretaries of canoe clubs are requested to send to Forest and Stream their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to Forest and Stream their addresses, with logs of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

RONDOUT C. C.

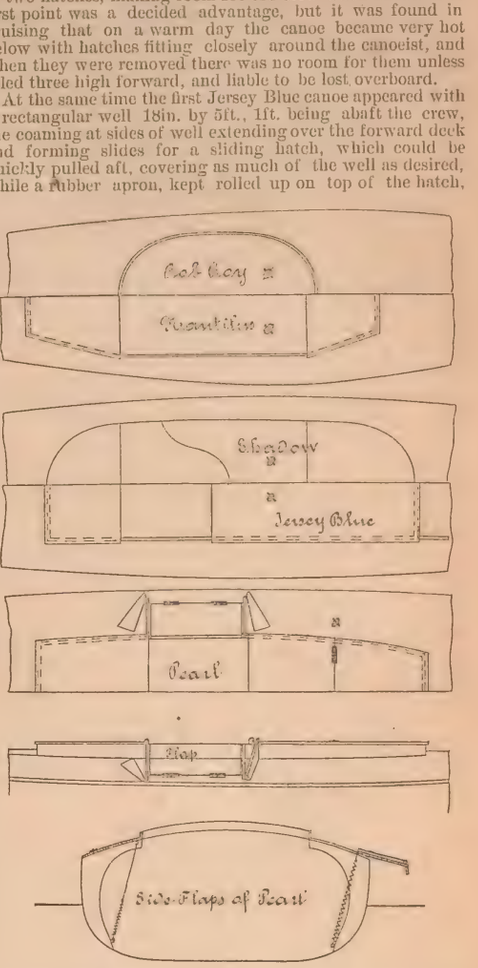
Rondout C. C., Rondout, N. Y. Organized Jan. 22, 1884. Commodore, Grant Van Deusen; Vice-Commodore, Jansen Hasbrouck, Jr.; Secretary and Treasurer, H. S. Crispell. Nine active members.

AMATEUR CANOE BUILDING.

Eleventh Paper.

CANOE FITTINGS.

WHILE the first requisite in a canoe is a properly-designed and constructed hull, there are a number of minor parts, generally summed up under the head of "Fittings," that are hardly less essential to safety, comfort and convenience, and which, with the sails and rigging, make up a complete craft. Perhaps a more correct term for these numerous details would be equipment, but the word fittings is generally used.



The Well.

This feature distinguishes the modern canoe from its savage progenitors, as, excepting the kayak, savage canoes are undecked, and its shape and condition are important considerations. As a general rule, the smaller the well, the better; as less water can get below, there is more covered stowage room, and the boat is much stronger; but, on the other hand, there must be an opening long enough to permit sleeping, storing long spars below, giving access to hatches below deck, and, on occasion, taking a companion. The wells of the early Rob Roys were elliptical, 20in. wide and 32 to 36in. long, requiring no hatch, the coaming, 1in. high above deck, being bent in one piece, as in the drawing. This small well, resembling that of the kayak, was almost a necessity, as the boat was so low and wet in rough water.

A step in advance was the old Nautilus well, which was from 4ft. 8in. to 5ft. 8in. long, and 20in. wide, a length of 16in. being shut off by a movable bulkhead just abaft the crew's back; this portion being covered by a movable hatch, with a similar hatch at the forward end, leaving an opening of 2ft. or a little more for the crew. This well, with its ugly octagonal form, while a decided improvement in many ways, more than any other feature earned for the canoe the dismal epithet of coffin, once so frequently applied to it; besides which, owing to the number of pieces (eight) it gave no strength to the deck, and the joints soon opened and leaked, while the almost square end forward did not throw the water from the deck, but sent spray back over the crew.

In 1878 the Shadow canoe came out with an elliptical well 20in. by 5ft., covered by four hatches, so arranged as to close the well entirely in shipping the canoe; or by removing one or two hatches, making room for the crew when afloat. The first point was a decided advantage, but it was found in cruising that on a warm day the canoe became very hot below with hatches fitting closely around the canoeist, and when they were removed there was no room for them unless piled three high forward, and liable to be lost overboard.

At the same time the first Jersey Blue canoe appeared with a rectangular well 18in. by 5ft., 1ft. being abaft the crew, the coaming at sides of well extending over the forward deck and forming slides for a sliding hatch, which could be quickly pulled aft, covering as much of the well as desired, while a rubber apron, kept rolled up on top of the hatch,

completed the covering. This arrangement answered the purpose of protection, but the square corners and sliding hatch were clumsy and heavy in appearance.

At the same time a canoe was built in Harlem having a pointed coaming forward, with a slight flare, the first of its kind, in America at least, and in 1880 the Sandy Hook and Jersey Blue canoes were fitted with pointed coamings, but not flaring, the first of the style now so common being put in the Dot in place of the Shadow well in 1881.

This form of well, shown in the Forest and Stream of March 13, is in outline similar to a Gothic arch, and in addition the sides flare outward, throwing off all spray at the sides. The after end is made either round or square, the latter giving more room when two are carried. A chock of mahogany (*q*) in the drawing, is fitted in the angle, belaying pins or cleats being sometimes put on it. This form of coaming is well fitted to hold an apron, the fore end of which, being fitted to the point of the coaming, cannot wash off, and no spray can beat in under it. The well may be partly or entirely covered by hatches, as desired.

Another important feature in a well is its width, which must be regulated by the size and intended use of the canoe. In a narrow and shoal boat, such as the Rob Roy, a width of 18in. will be enough, as the side decks will be wider and less water will come over the side, while the crew can still lean out to windward, but in a wider and deeper boat there is less danger of water over the side, and the coaming being higher above the floor will interfere with the crew leaning over, and therefore should be made wider, the usual width being 20in.

American practice in canoe sailing, especially in racing, differs materially from the English; the crew, in America, almost invariably being seated on the weather deck, in sailing to windward, the feet braced under the lee deck, the body leaning well to windward, and the steering being done by means of a tiller on the after deck, but in England the crew is seated low down in the canoe, a portion of the deck abreast the body being cut away and the opening closed at will by a hinged flap, the weather one being closed and the lee one opened at the end of each tack, only the head and shoulders being above deck, offering but little surface to the wind. With this arrangement a narrow well is allowable.

That canoeists may judge for themselves as to the value of this feature for their work, we quote from the London *Field* the opinions of Messrs. Baden-Powell and Tredwen concerning them. The former gentleman says: "In describing the canoe fittings of the present day, the side deck flaps must not be omitted. In a sailing canoe it is all important, but I do not admit its great utility in a traveling canoe, at least, not for general work. Where the chief work is to be lake sailing, side flaps will be very useful; but where much hauling out and jumping in and out is to be the order of the day, side flaps are utterly out of place. The side flap was first introduced in the Rob Roy in 1868, but did not appear in the next edition of that name. It has, however, now become a general favorite, and it is to be found in every sailing canoe. If fitted to the traveling canoe, the after end of the flap should be just forward of the backboard beam, and it should be strongly hinged at the outer edge; and, in short, strongly fitted in every way, as it is just about the place that one's hands lay hold of to raise the body in case of a sudden jump up or out. A broken, and perhaps lost overboard, flap would be a dangerous mishap to a canoe, if caught at the time in a breeze at a mile or two from land."

Mr. Tredwen, after describing some of the canoes that he

has designed and built during the past fifteen years, continues: "It has already been observed that the flap side decks have not been fitted to all the Pearl canoes, and that where a canoe has been built with them, they have been subsequently discarded, and that the next canoe built without them has subsequently been altered by the addition of this contrivance. The result of this varied experience is to establish them as a very valuable adjunct to a cruising canoe if properly applied and fitted, otherwise they are better omitted. There are two essentials besides the flaps themselves, consisting of two sets of coamings around the openings cut in the deck. The first coamings are parallel and close to the cuts across the deck, and consequently at right angles with the ordinary well coamings, and are screwed securely to the deck, and their inboard ends butt on to the well coamings. They entirely prevent any leakage along the deck from forward or aft, into the openings of the flap side deck.

"The second set of coamings are placed transversely, hinged to the deck, and when raised their inboard ends fit closely against the beading or coaming of the hatch cover; and they are not intended to exclude leakage along the deck, but they serve as catches around which the mackintosh coat fits, to prevent any sea breaking into the well. The inboard ends must therefore project about half an inch above the hatch cover when they are raised. Many canoes have had these hinged coamings fitted without the fixed coamings, and without sufficient width to project above the hatch cover, and as they neither exclude water running back along the deck, nor provide a holdfast for the mackintosh, the whole contrivance has been condemned."

In this country the first step in this direction was in the Elfin, a New York canoe, which in 1878 had her coamings cut and hinged; the first real side flaps being put in the Sandy Hook in 1881, since which they have been tried in various canoes, but have not come into general use. Their construction is shown in the drawings.

In the Pearl canoe, the well, which is almost rectangular, is covered by a forward hatch in two parts, the after portion extending to the body being hinged to the forward part, so as to lie flat on it, when opened. On its after end is a beading, over which the skirt of the canoe jacket is drawn, this skirt also being held, by a rubber band run around its lower edge, to a similar beading on the after hatch, and to the hinged coamings described; the deck flaps opening inside the wide skirt, so that there is no entrance for water below. Where it is desired to close the canoe entirely, the well is covered by three or four hatches, fitting closely together, as shown in the drawing of the Shadow. These are held down by a bar running over them fore and aft, one end of which is inserted in an eyebolt at fore end of well, the other padlocking to a similar bolt aft.

THE EVERSON CANOES.

WHEN the New York C.C. was first organized some fourteen years ago, one of their earliest acts was to look for a boat builder who would undertake to build the heretofore unknown craft. As the result of their search, they settled on Mr. James Everson, of Williamsburgh, N. Y., already well-known as a builder of Whitehall boats, and to him entrusted the drawings of the early Nautilus, sent to them by Mr. Baden-Powell, and since that time many well-known boats have started their first voyage from this shop, the Violetta, Walrus, Rosalie, Kaloolah, Shadow and Dot, besides others less widely known.

A visit to Mr. Everson's shop will well repay any one interested in canoes. The first boat noticed on entering the door is a very handsome cruising and racing canoe that will soon fly the N. Y. C. C. burgee, her lines being designed for a member of that club by Mr. John Hyslop. The leading dimensions are 15x31, with 13in. depth amidships; a handsome sheer, straight keel, sternpost straight and raking about 3in. aft. The bow is worthy of special notice, and the stem, well cut away below water but nearly plumb above, is handsomer and more yachtlike than the curved form so common here. With 9in. crown to the deck, there will be ample room inside. The well will be pointed and flaring, coaming 3½in. high forward. The keel is flat, to admit of Child's patent centerboard, which will be of brass, weighing nearly 50 pounds, and housing inside the canoe. If fitted with a suitable rig, there should be nothing in the N. Y. C. C. fleet that can approach her, and she will doubtless make a record at the meets this season.

Besides several new canoes of the well known Shadow model, there are two designed by Mr. Charles Farnham especially for cruising work that are ahead of most boats of similar dimensions. They are 14ft. 4in.x30in., without the tumble-home so noticeable in the Shadow—an improvement in looks at least. The keels are flat, and well rounded up at the stern as well as forward, the sternpost being straight from the water line up. Both are fitted with keels to be screwed on, if required, and also with air tanks of Morse's non-corroding metal, the deck hatches being dispensed with. The sliding bulkhead consists of a frame, over which leather straps are passed, making a yoke on which the canoe may be carried.

Besides the new boats mentioned, there is a curiosity in the shape of the Violetta, built for ex-Commodore Alden some twelve years since. All the canoes built by Mr. Everson are lapstreak, and their record, after the rough usage of cruising and hard racing, proves not only the excellence of his workmanship, but also of this method of construction.

CANOE AND SNEAKBOX.

Editor Forest and Stream:

Wonders will never cease. Who ever thought that a canoeist would be bold enough to fling out a challenge to sail against the sneakbox. I have had some years' experience in the sneakbox, it being of Jersey origin; and gunning from it in my younger days, I think I am pretty well conversant as to what it can do.

I have never sailed in a canoe, but being a close observer of their struggles in their endeavors to stand up to it, and with their knock downs, shakes and luffs, I think that the sneakbox would have a walk over. And as for cruising by all-water routes, and for comfort, commend me to the sneakbox.

Staunchness. Well, I always considered myself at home in any weather. I sent a sneakbox to Maryland this winter, of the Kilpatrick make, and the way she skipped across the mouth of Rumney Creek caused my friend William, who never sailed in one of these craft, to remark: "Well, who ever thought these things could sail the way we are going!" Six yards canvas (winter rag), a fearful blow, and 320 pounds to windward. Size of boat, 12.0x3.10. Will Dr. Neidé please inform me the kind of race, and where to take place, he would like against a sneakbox? "Seneca," in the issue of FOREST AND STREAM of March 6, declines. The Doctor will please speak out. Who knows we may have a race yet. GEO. H. WILD.

RED BANK, N. J.

[There will be a fine opportunity for a race at the Newburgh camp on May 29 and 30 of this year, as Dr. Neidé will be there, and many other canoeists, and the friends of the sneakbox will receive a hearty welcome. A correspondent in the South, who has been cruising in a 14x30 canoe, with 150 pounds of ballast and 178 pounds crew, in company with a 14x4ft. 3in. sneakbox, writes that the canoe is more than a match for the latter on every point, blow high, blow low.]

THE CHART LOCKER.

V.—INLAND WATERS OF MAINE.

Editor Forest and Stream:

In reply to "X." who asks for information in regard to the route to Megantic Lake and the Chaudiere via the Kennebeck and Dead rivers, I can say from personal observation that he would find it an extremely difficult operation (I doubt if it is possible) to make the ascend of the Kennebeck and Dead rivers in a Stella Maris or any other decked canoe that is not susceptible of being poled.

My friend, Mr. F. Stanton Hubbard, and myself, made the trip last June in an open English (Peterboro) canoe 18ft.x30in., launching at Gardiner, Me. "X." would find no scarcity of water in the Kennebeck between Gardiner and Norridgewock, but beyond there the water is shallow and very rapid—so say the natives, I have no knowledge of it from personal observation.

We left the river at Bombazee Rips, 4 miles above Norridgewock and portaged to Sam Parson's on the Dead River via North Anson, distance about thirty miles, over a very excellent road. The portages on the Kennebeck between Gardiner and the point at which we left it are, first, dam at Augusta, carry about ¼ mile on left bank; second, between Waterville and Kendall's Mills there are several dams around which a carry must be made with a team, distance 3 miles; third, carry around Skowhegan Falls and Dams, distance about 2 miles. There are also many booms and a few rips over which canoe must be hauled.

From Parsons to Flagstaff, distance 12 miles, the river is very crooked and current quite rapid; there are two or three short rips, up which canoe must be hauled or toted around. Between Flagstaff and Eustice, distance 18 miles, the river is very crooked. Carry around Arnold's Falls on right bank—distance about ¼ mile. There are several vicious little rips on this stretch, which must be either poled up or carried around.

At Eustice there is a dam, carry short; on left bank, one mile above, carry around Ledge Falls, distance short. Next another Arnold's Falls, carry on left bank, distance 100yds.; then big and little Scrampus Falls, few rods between, carry on right bank, distance about 150yds. Chain Pond Dam, six of one and half dozen of the other, which side carry is made—short in either case. Pass through Round Pond in Long Pond, at head of which lives Peter Le Royer, Indian hunter. Peter's word can be relied on for directions as to reaching Megantic Lake.

From Long Pond into Horseshoe Pond, narrow, swift stream, to Atkinson's Dam, distance not less than 4 miles; some hard work must be done in the way of poling, tracking and lugging over ledges and fallen trees. Haul over Atkinson's Dam, cross small pond and carry one-quarter mile into Mud Pond, cross this and then carry one-half mile into Moosehorn or Arnold Pond.

From Arnold Pond to river of same name, carry six miles over a bad trail. At time we were there last year the Arnold River was so full of logs that we were forced to carry six miles to head of Megantic Lake. For information in regard to the Chaudiere River, see "Chaudiere by Paddle and Portage," by Chas. E. Chase, in *Frank Leslie's Monthly*, August, 1881. CHAS. A. NEIDÉ.

Editor Forest and Stream:

In response to your request for parties able to give information in regard to canoeable waters in this vicinity to send their address to you, I send my own. If any canoeists coming this way will call upon me, I shall be most happy to show them about here; and if they can manage to strike here Saturday night, I will take them to one of the prettiest lakes in New England where they will meet a number of canoeists, although no organized club. E. M. JAMES.

44 MANCHESTER STREET, Manchester, N. H.

THE WINTER CAMP-FIRE.

THE attendance at the fifth camp-fire last week was smaller than usual, there being about a dozen members present. Mr. King, who had offered to speak on the subject of canoe tents, was absent, being confined to the house by sickness, and no formal meeting was held; but those present enjoyed a very pleasant evening in the discussion of announced subject, and in comparing experiences of cruises in various places. The date of the next meeting has been changed, as will be noticed above, to Wednesday, April 2.

RONDOUT C. C.—This club gave their first reception on Friday evening, March 7, at their new club house. The invitations, specially designed by a member of the club, summoned the guests at "8 bells" to the club house, which was decorated with flags, burgees, paddles, boxing gloves, snowshoes, models, pictures and canoe gear of all kinds, the canoeists themselves being in boating rig. "Mess" was served at 2 bells by the members, and dancing followed at 4 bells.

CLUB NOTES.—A canoe club is now being organized in St. Paul, Minn. The Vesper Boat Club, of Lowell, Mass., has now a fleet of twenty-five canoes, and proposes to organize a canoe division. Mr. Frank H. Pullen has returned to Lowell from Chicago. Dr. Neidé writes that there have been thirty-five applications for membership since the last meeting.

Yachting.

FIXTURES.

May 24.—Oswego Y. C., Opening Cruise.
May 24.—Boston Y. C., Opening Cruise.
May 30.—Knickerbocker Y. C., Spring Matches.
May 30.—Atlantic Y. C., Opening Cruise.
May 30.—Newark Y. C., Spring Match.
May 31.—Boston Y.C., First Match, Connor and Commodore's cups.
June 9.—Portland Y. C., Challenge Cup.
June 10.—Atlantic Y. C., Annual Match.
June 12.—New York Y. C., Annual Matches.
June 14.—Hull Y. C., Club Meet.
June 14.—Seawanhaka Corinthian Y. C., Annual Matches.
June 16.—East River Y. C., Annual Matches.
June 23.—Newark Y. C., Open Matches.
June 28.—Boston Y. C., Ladies' Day.
June 30.—Manhattan Y. C., Annual Cruise.
July 9.—Beverly Y. C., Marblehead, First Championship.
July 12.—Hull Y. C., Club Meet.
July 12.—Boston Y. C., Second Club Match.
July 26.—Beverly Y. C., Nahant, Second Championship.
Aug. 9.—Hull Y. C., Club Meet.
Aug. 9.—Boston Y. C., Open Matches, all clubs.
Aug. 16.—Beverly Y. C., Swampscott, Third Championship.
Aug. 23.—Beverly Y. C., Marblehead, Open Matches.
Aug. 23.—Boston Y. C., Third Club Match.
Sept. 6.—Beverly Y. C., Marblehead, Special Matches.
Sept. 13.—Hull Y. C., Club Meet.
Sept. 13.—Boston Y. C., Second Ladies' Day.

SOME VALUABLE EXPERIENCES.

Editor Forest and Stream:

About six years ago I was skipper of a little yawl hailing from Quebec. She was 18ft. keel, 8ft. beam and 3½ft. draft. She carried us through almost any weather in safety and moderate comfort, thanks to plenty of ballast and moderate deadrise, but had too little keel to go to windward very well, and was too short and chubby to run fast, especially when jumping about in the short seas which the Lower St. Lawrence and Gulf can get up when wind is against tide. Later I took a cruise in a grand boat of the same type, but 7 or 8ft. longer on the same beam and depth, and with the addition of a 10in. deep keel, ballast, pig iron, and all inside. Long floor, with moderate deadrise; bows fairly fine on water-line, with lots of flare. Two of us ran her day and night and through any weather, and a magnificent run we had.

I will not forget in a hurry our return to the grand old city of Quebec. Flying up the river before the remains of an easterly gale, on the top of the flood tide, after a trying night of darkness and storm and rain, during which we ran ninety miles with only a triangular corner of the mainsail set, the peak being dropped. That was the last of my salt-water cruising so far. I hope it will not be the finish altogether. Then followed a long series of years on inland rivers, where I was obliged to content myself with skiffs and centerboards and factory cotton, and used to balance myself on the weather gunwale and keep a sharp lookout for puffs. Lake Superior was a magnificent change for the better. First I tried a fishing skiff about 25ft. keel, flat as a pancake on the bottom. A few rocks for ballast and one mast right in her nose and another in her center, with two spritsails, the most unscientific rig I believe that was ever invented. She was a centerboard, of course.

I pounded around Thunder Bay in this thing until I was sick, and had nearly broken the boat's back, and sprung both masts, and was glad to sell out for twenty-five dollars. Next I tried a catamaran and the first puff pulled up the backstays and the deck with them, and the least little sea threatened to dislocate the whole contrivance. Then followed a good honest boat, yawl again, of seven tons, with standing keel and lots of ballast, which a friend and self built to suit ourselves. She was 25ft. keel, 8ft. beam, and 4½ draft. And she is to this day the most comfortable cruiser and the ablest boat on the bay. My friend was a busy man and not often able to cruise, and the boat too large for me to handle myself, so I sold out and built myself a rough and ready little yawl of 20ft. keel, 5ft. beam, and 4ft. 9in. draft with some ballast hitched on to the keel and any amount inside. More as an experiment than anything else, and consequently just thrown together in any shape so long as it was cheap.

This little hooker, with her bottom foul all the time, she was merely paid over with coal tar and bolt heads and rivets sticking out all over, ballast of blacksmith's scrap and sand, berthed three of us on a two weeks' cruise of 500 miles in her tiny cabin under a flush deck, and behaved in an astonishing way in a stiff breeze and rough water. Latterly she was lightened up a little and rigged as a cutter, and is said to sail much better. Last fall, in a southeasterly gale, beat out six miles to windward with a couple of ladies on board, made her port and came back, when a 30ft. fishing boat of the centerboard persuasion making for the same point, turned and fled. Her faults were that she was too short and "jumped short," as the fishermen say, and her accommodations were rather meagre.

For the last two summers I have been cooking about the coast, and incidentally have done a lot of boat traveling. Have made long trips in every month, from early in May to late in January, and have had a nerve-trying time in these wretched flat-bottomed, clunker-built boats, hammering at head seas with a disheartening amount of leeway, and the boat threatening to stave in her bows or break her back at any moment. Was obliged to bear away, and run before a furious squall on one occasion simply because all the centerboard we could give her would not hold her waste hulk above water and light weight, and enable her to work up under short canvas. Another time we were literally blown away from our anchor and hove on the beach in fairly smooth water, and nearly starved and frozen to death before we got afloat and reached camp again. All this, and the prospect of more traveling next summer, has moved me to design the Freda, a narrow yawl or ketch-rigged yacht of 29ft. waterline, and 6ft. 4in. beam, with 5,000 lbs. on the keel. H. K. W.

PORT ARTHUR, Lake Superior.

A VERY FAST YACHT.

THE Petrel, the property of Mr. John Hyslop, of New York, is pretty well known to local circles as a yacht of more than ordinary speed, and, above all, as a yacht which excels on all points in all sorts of weather. But with her form under water few are acquainted. The Petrel carries valuable lessons on many of the principal topics continually cropping out in club gossip, and also demonstrates what can be done by earnest study and the application of science. She is a production of great interest to all, and is to be considered a prominent beacon, marking the turn around which public opinion has swept during recent years. Built in 1876, the honor of leading off in the reform must be conceded this handsome little vessel. True, the cutter Vindex had preceded the Petrel by several years, but the Vindex did not represent in the elements of her design a very radical departure from the proportions of a deep sloop, though in point of outline and rig she properly enough laid claims to recognition as a cutter. The Petrel, on the contrary, borrowed none of the sloop's elements, but was a complete departure and bold "revolution" upon all the cherished traditional dogmas of the old sloop school, according to whose creed she should have been a depressing failure in every respect. Had the owner sought prominence for his boat through working up a racing record, the advent of the Madge and her victories would have possessed nothing novel or instructive, as we should have learned through the Petrel's performance what the Madge drove into our heads at a much later period. Indeed, the few who followed the Petrel with intelligence, and who were free from preconceived notions, did privately reach those very conclusions which escaped the public at large, until the fame of the Madge's victories had been spread broadcast over the land. What we may for short call "cutter principles" received the most successful and complete vindication through the sailing of the Petrel. Most prominent is of course the fact that she is a keel boat, and the equal, or rather more than the equal, of any centerboard of her loadline sailing with fixed ballast. She exploded most thoroughly that ludicrous old fancy, that in practice the board is a whit faster than the keel, and for that alone, if nothing else, the Petrel deserves to rank among the most influential achievements in the yachting world. The old school was much given to theorizing and the construction of rickety samples of logic. The new takes its departure in the field of fact and accurate observation. Now, in theory the board is a faster contrivance than the keel, for the reason that its area is more effective, and consequently a smaller amount exposed to skin friction supplies the same weatherliness as a larger amount of keel which, owing to its length, is not as effective. But in practice all this is again wiped out, because the keel offers the chance to hang ballast so much lower, equivalent to an increase of sail area, which overcomes, and often more than overcomes the extra amount of friction. And furthermore, the keel so steadies a boat on her helm, and holds her down to business in choppy water, that the actual advantages in practice at least balance the theoretical inferiority. The Petrel is proof most positive of the foregoing. For, cut the keel from beneath and supply a board instead, and a single glance at the accompanying plans will convince any yachtsman that the Petrel, as a centerboard, would have been a complete failure. She could not have carried her present sail plan by a good deal, nor could she have been pressed. She would have been exceedingly tender, without a will of her own, and in no way the good vessel she really is. It is often the custom to point to some of the old-fashioned, flat-floored boats, with a plank spiked underneath, as evidence against the keel, or to the many ancient keel tubs sailing in competition with the fastest modern boards of the day. But their comparatively poor display is to be, in justice, attributed to form and poor design, as well as inferior ballasting. Whatever such keel boats may do, the Petrel is always indisputable proof that a keel boat *can* be made to equal any board yet produced, if the design, as a whole, is made to conform to the requirements of a keel, just as experience has clearly marked out certain attributes as necessary to a successful vessel supplied with a board. The Petrel, the Bedouin, the Oriva, would all be fearful failures were they to change to the board, and similarly it is rational to suppose that the keel must fail unless the vessel, as a whole, is of suitable planning. Where this is overlooked, the keel, as a matter of course, turns out more or less of a failure, and as all our builders were brought up to the trade of scheming upon boards, the new departure in favor of keels finds them laboring under the disadvantage of old associations, from which they cannot as yet quite free their minds while exploring an unaccustomed field. But give them the time to unlearn and learn afresh, and the brilliant success of such yachts as the Petrel ought to be convincing enough as to what is possible with the keel. More especially so, when we mention that owing to the exigencies of personal business affairs, Mr. Hyslop has never been able to bestow more than casual attention to the equipment of the Petrel, and nowadays no experienced man needs to be told that want of perfect preparation in this respect is a very heavy handicap with which to come to the line as a fighting vessel. The official record of the Petrel, though an excellent one, is dimmed somewhat by the unavoidable drawback as explained. But it is to her cruising reputation, her many off-hand brushes with other well-known yachts of her class, that we must look for a true interpretation of her capacities. It has been our good fortune to ship aboard the Petrel upon many an occasion, and our own verdict as well as that of those intimately acquainted with the yacht, stamps the Petrel as a cutter of phenomenal speed. Should she ever be taken in hand in earnest and skippered for what there really is in her, we do not hesitate to predict for her a racing career which will put her in the van of public estimation as the fastest yacht of her loadline yet launched from any port on this side of the Atlantic.

Her lines and elements are therefore deserving of the closest study and we deem their production in these pages for the benefit of the public one of the great services rendered to yachting through this journal.

The Petrel is a craft entitled to a niche in the temple of fame for reasons other than her speed. She is a "scientific" design in the fullest meaning of the word. She was not whittled out as a happy-go-lucky venture, but was deliberately planned for a purpose. Mr. Hyslop had given Scott Russell's wave line theory full investigation, and backed by numerous well executed experiments arrived at the conclusion that wave lines only opened the door to an enlarged system of construction of far more importance and more immediate applicability than mere cycloidal waterlines could possibly convey. Long before the Petrel was struck out on paper, Mr. Hyslop had formulated the system of "wave-line areas," in which the cross sections are made to correspond in the relation of their areas to the ordinates of the wave curve mooted by Scott Russell, instead of giving such shape to waterlines, only regardless of their areas. Thus the theory which Scott Russell applied to the contour of lines only, Mr. Hyslop impressed upon the actual volume of the boat passing through the water. This same system was later on composed by Mr. Colin Archer, a Norwegian shipbuilder, and by him published in the London *Field* some years ago, and by his name the system now generally goes. It is right, however, that Mr. Hyslop should share in the credit of the production of a method which, in some of its details, he has carried to a degree of refinement beyond the proposition of Colin Archer. Of course we are not prepared to reason from the single success of the Petrel that the system is the long-sought philosopher's stone, and that equally favorable results can be counted upon with certainty by simply mechanically revolving the crank of some set formula, but the Petrel is at all events strong prima facie evidence that a close adherence to the formula is compatible, if not directly conducive to the highest results, while as a general standard of comparison for estimating the elements and data of boats, the system admits of no question. There seems good reason to invest it with promising import, as Mr. Hyslop has brought the formula into requisition upon other occasions with favorable results. The new cutter Merlin was designed by Mr. Ripley on the same principles, and will be watched closely in pursuit of further testimony for or against. It is likewise noteworthy that all fast yachts of which data are at hand correspond in their cross areas very closely to the wave line ordinates, including those owing their success to "intuition," that is whittling with an eye to whittle by. It should be added that Petrel's waterlines are also in themselves wave curves.

Her main features can be described as follows: Moderate beam, insuring generally fine form, "Two ends," in place of the long entrance and short, heavy haunches prevailing in sloops. A rocker keel with

raking post, the lowest position to weights, with a high center of buoyancy, to compensate for moderate displacement, thereby insuring enough sail with the choice of driving the boat upon an easy side. A proper balance between immersed and emersed wedges preserving the same trim as when at a plumb and the ease on her helm which follows. Healthy draft in proportion to displacement. For a boat of her depth the Petrel is distinguished by the wonderful ease of her fore and aft sections and her diagonals, as inspection of the plans will elucidate. She has just enough flare to her bow frames to lift dry and clear, just enough tumble home to topsides for a long easy body to drive when heeled under pressure of wind, and her quarters are drawn in just enough for perfect delivery and at the same time ease in her motions. She lifts to everything because free from haunches aft to prevent the depression of her stern. In regard to rig she is a cutter in point of principle, though in some of the mechanical features corresponding to the sloop. Her sail plan will be produced next week.

In actual sailing the Petrel is perfection. She is the easiest boat imaginable, and though her lee gangway is awash by the time she is fairly down to her bearings and at her best in a smart breeze, she is remarkably dry to windward. She throws no spray in the hardest drives, and rides to her chain like a rocking chair without tug or snub of the slightest appreciation. She is able in a chop, and with two cringles down puts in licks to windward, screwing out higher than she points in astonishing style She is at all times and in all weather very fast, jammed high or romping with sheets lifted. From actual experience through several seasons we know her draft never gives anyone the slightest perturbation, which can easily enough be understood when we remember that five feet is scarce neck-high, and no call exists for sailing in shoaler water when there are thousands of square miles where more than five feet can be carried to every one-acre puddle with less. There is no difficulty in beaching for a scrub, as a leg is got out abreast the chain plates at high water, and the throat and peak carried broad off to steady as the water falls away. Her rig presents no complications in practice whatever. The foresail has a high boom to the foot, the boom working on the sheet as a traveler, so that foresheet need not be touched in beating up. One might sail in her all day and never be aware of her cutter rig. No one who has cruised in her ever as much as mentions or notices her double head sail, which is answer enough to the bugbear about "complications."

On the other hand, the rig is found extremely convenient, as it does away with all reefing and bobbing of jib and also gives greater choice of arrangement of sail. The area is quite moderate for the boat's length, far less than in a beamy hard-bilged sloop, and spars correspondingly snug and light with beneficial effect in a head sea. The Petrel heels quickly to her bearings as can be imagined, and until it blows strong is over on her side considerably more than a sloop, but never enough to interfere with perfect control and the management of her gear, or "comfort," in spite of the impressions her heeling may produce upon the inexperienced seeing her under way. And when heeled she goes along about her business in holiday fashion without towing her helm over the weather quarter, and without any gymnastics to keep her on her course. And her speed in a breeze is enough to contradict that ludicrous vagary that the wind "just blows over her sails" without doing any good. And her speed and keen pointing at all times is likewise enough in opposition to the equally absurd notion that one big bag of a jib drives better than two well trimmed flat surfaces, the inner sail operating to better purpose on a forestay at much less obtuse angle than the lifting, and therefore less effective lead of a single jibstay to bowsprit end.

Practically, the Petrel opened the title chapter of the new era in New York waters, and that the first attempt to depart radically in all essentials from the cast-iron dogmas of snarled tradition in American yacht building should have been accompanied by such unequivocal success is the reward of her originator for his independence of thought and clear analysis of the principles of design. As the pioneer of the new era, as the first "American cutter," as the exponent of intelligent process, as a flyer of first rank, the Petrel will always live a bright and shining example in the history of the transitory period through which American yachting is now passing.

Length over all	32ft.
Length L.W.L	28ft.
Beam extreme on L.W.L	8ft.
Depth, plankshеer to garboard on M.S	4ft. 7in.
Least freeboard	16½in.
Greatest draft	4ft. 10½in.
Displacement	7½ tons.
Ballast inside	4,000lbs.
Ballast on keel	2,526lbs.
Area lower sail	800sq. ft.
Hoist of mainsail	20ft.
Ratio of sail to square L.W.L	102 per cent.

Attention is called to the small sail area required to drive the Petrel. It is about the same as that of the sloop Gleam of only 23ft. loadline, and the hoist of Petrel's mainsail is much less, being 18ft. against Gleam's 23ft. The great economy in driving power and management of the cutter is very apparent. The Petrel on 28ft. drives 7½ tons displacement with practically the same sail the Gleam requires for only 5 tons on 23ft. There is little difference in the cost of the two boats, but the cutter is much the larger, abler, and would leave the Gleam out of sight in a match, all of which is obtained by departing from the tradition of great beam and centerboard, and building upon an intelligent and well considered scheme. The difference in ballast between the two is about two tons, or say $50 for inside iron, a purely nominal sum, considering the far greater return received from the Petrel's design than from that of the Gleam.

CUI BONO?

Editor Forest and Stream:

Believing as I do that under equal conditions the cutter Aneto did not nor can outsail the Gleam, I will match the Gleam against the Aneto for three races for $100 cup each race; Atlantic Y. C. course and rules.

JOHN G. PRAGUE, A. Y. C.

47 Bible House.

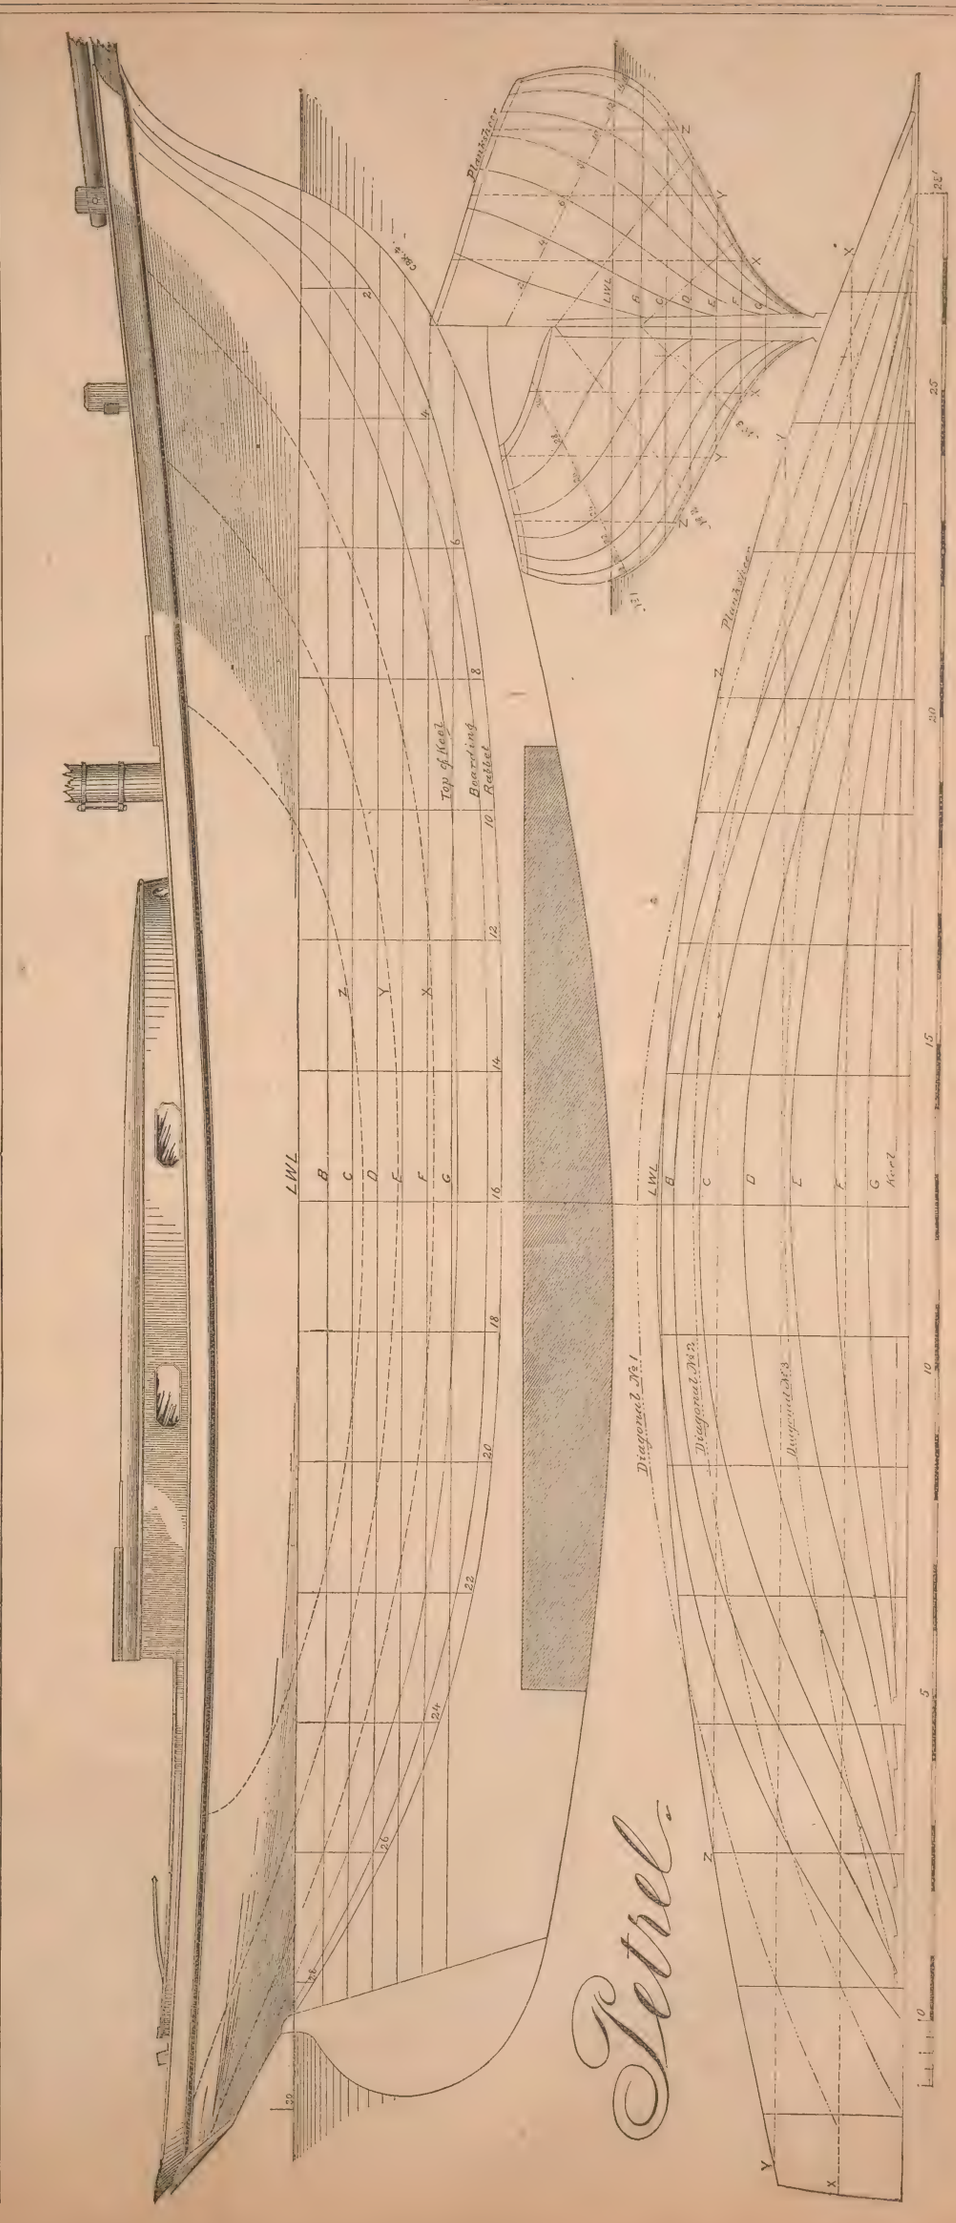
[The proposition is hardly likely to lead to a race, as no grounds for a race exist. Aneto is a little cruiser, 21x7ft., with a lower sail area of 405 sq. ft. Gleam is a racing sloop, 23x9, with an area of 788 sq. ft. Hoist of Aneto's mainsail is 14ft.; that of Gleam is 23ft. The difference in size and character of the two boats is much too great to permit their racing to any logical purpose. The Aneto is also yawl-rigged, which of itself is enough to prevent a match upon even terms, as the Atlantic Y. C. rules impose. Nor do we suppose that any sensible person, least of all the owner of the Aneto, claims her capable of beating Gleam in ordinary weather. About the only chance for the Aneto is in a drift pure and simple, which would be without satisfaction to either party, or else in a nose-ender with a jump when Gleam is at her worst, owing to excessive beam and oversparring, conditions under which Aneto came out best in a brush between the two last fall out of Larchmont harbor. Such conditions could not be insured in Mr. Prague's offer, and without them no one pretends the snug little cruiser Aneto a match for a boat one-third larger, with nearly twice the sail area].

BELLEVILLE NOTES.

THE projected Lake Yacht Racing Association will soon, in all probability, be an accomplished fact, as nearly all the clubs concerned have signified their approval, and appointed delegates to a convention which will be held two weeks hence in Toronto for the purpose of organization. The knotty points will be the limits for second class, shifting of ballast in second class, and rule of measurement. I have no doubt that the length and sail area rule of measurement will carry, and that standing ballast will be decreed, but the classification will be troublesome, as several yachts were built to the extreme verge of the old limit, which ought to be conformed to as closely as possible in justice to all concerned.

Mr. R. J. Bell's Norah is on the Marine Railway at Deseronto, where she will get a thorough overhauling before entering on another season's work.

Treasurer Pike's cutter Sylvia is to get a heavier keel, which she is in great need of.



A new steam yacht may be added to the fleet this year.

No new craft in hand here, and no repairs or fitting out yet.

PORT TACK.

THE LAKE Y. R. A.—The following letter has been addressed to the Toronto *Mail:* "Sir—The majority of the yacht clubs of the lakes having expressed themselves favorably to a lake yacht racing association, and some of them having suggested the time of the Kennel Club show in this city for a meeting of delegates, and it also having been found that three delegates have been appointed by most of the clubs, it has therefore been deemed advisable to call a meeting of three delegates from each club at the Queen's Hotel, Toronto, on Saturday, March 29, at 3 P. M. These delegates to draw up a constitution, elect officers and committee for the present year, decide on a measurement rule, and, in fact, get the association fairly under way. It is desirable that delegates attending the meeting should make themselves thoroughly acquainted with the constitution of similar association as far as possible, also with the different measurement rules.—WM. DICKSON, Hon. Sec. Toronto Y. C."

NEW ENGLAND Y. R. A.—Clubs are entitled to admission which have twenty-five yachts of more than 16ft. length, not 10ft., as misprinted.

MODEL YACHT.—Mr. Daniel T. Hendrickson, of No. 22 East Mechanic street, has just completed a miniature model of a modern racing cutter from the lines laid down in FOREST AND STREAM last summer in illustrating the Neva, of Boston. It is extremely doubtful if a similar model has ever been made with such faithful attention to detail and skillful handling of the numerous small parts. The hull is built of white wood in two pieces, each half being steamed and bent into perfect conformity with the framework of ribs. The rail and trimmings are of mahogany and white holly, the hull is black to the waterline and gilt below. The deck is laid off in seams conforming to the lines of the vessel, and a grating of mahogany occupies the bow, where also is a small working capstan of brass. A geared steering wheel moves the rudder, and little blocks with sheaves of brass are all in their proper places, and will do their required work. The cockpit is upholstered with velvet seats and surrounded with a coaming of white holly and mahogany, each strip of which is about one-quarter inch wide and an inch long, and is worked with a delicate bead. From the cockpit four mahogany steps lead down into the cabin, which is housed over and lighted with brass-rimmed ports. The cabin is carpeted, and contains completely furnished bunks and lockers and a dining-table, everything made exactly as though intended for the use of a Liliputian crew. The whole model is not more than 4½ft. in length, the hull measuring 32in. It is rigged with mainsail, topsail and jibs. —*Newark Sunday Call.*

LARCHMONT Y. C.—Officers for the year: Commodore, Augustin Monroe, sloop Schemer; Vice-Commodore, A. Bryan Alley, sloop Cruiser; Rear-Commodore, Harold A. Sanderson, open boat Zoe; Corresponding Secretary, William Porter Jenkins; Recording Secretary, Frank L. Anthony; Treasurer, Thomas B. Brown; Measurer, Frank E. Towle.

HAVERHILL Y. C.—Officers for the year: Commodore, W. M. Dresser; Vice-Commodore, G. A. Toxboy; Fleet Captain, N. G. Knowles; Secretary and Treasurer, C. H. Stacy; Measurer, Lewis Willett. Trustees—E. P. Tenny, L. H. Spaulding, C. H. Stacy. Regatta Committee—E. F. Brown, F. G. Knowles, J. E. Collins.

NEW HAVEN Y. C.—Officers for the year: Commodore, Charles W. Scranton, sloop Acme; Vice-Commodore, Frank Wheeler, sloop Wild Pigeon; Fleet Captain, Alexander Lutz, sloop Wild Duck; Secretary, Henry D. Bristol; Treasurer, James Gallagher, Jr.; Measurer, Frank H. Andrews.

MANHATTAN Y. C.—Officers for the year: Commodore, George E. Brighton, sloop Susie B.; Vice-Commodore, Henry Andrus, cutter Sasqua; Rear-Commodore, N. D. Lawton, sloop Gleam; Secretary, James R. Thomas; Treasurer, William H. Simonson. The annual cruise is fixed for June 30.

ISIS.—The new cutter building at Poillon's will be named the Isis. She is 62ft. 3in. over all, 51ft. 5in. waterline, 13ft. beam, 8ft. hold. and 9ft. water. Built from designs of the owner, Mr. Cass Canfield.

FORTUNA.—Through a member of Mr. Hovey's family, we learn that he is very much pleased with the performance of his schooner at sea.

GITANA.—Mr. Weld's schooner arrived at Villefranche March 13.

MONTAUK—Arrived at St. Kitts, Feb. 14; all well.

ANSWERS TO CORRESPONDENTS.

LONE ANGLER.—There is a letter for you at this office.

MAX. Hopedale, Mass.—A communication for you is at this office. Please send address.

E. G. B., Hartford, Conn.—We have never used the wads about which you ask, but are told that they will not do what is claimed for them.

J. H., Elizabethtown, Pa.—Where is the Bullard Repeating Arms Company located? And is Mr. Farrow superintending the making of the new rifle? Ans. Springfield, Mass. He is in their employ.

C. A. R., Pittsburgh, Pa.—1. Received the signal, etc. 2. We know of no such map. 3. Waters Bros., Troy, N. Y. 4. None of this size have been built. All such boats must be carefully kept and housed.

F. W., Paterson, N. J.—Which of the following woods do you consider the best for trout fly-rods, viz: Bethabara, greenhart, lancewood, or snakeroot? Ans. These woods all have their advocates and their faults. Lancewood if properly made, so as not to be too heavy, is as good as any.

E. J. B., Charlottetown, P. E. I.—Are the thread-wound cartridges for long ranges advertised in FOREST AND STREAM really of any use? A friend of mine here tried some of them and assures me that they are a fraud. Ans. We have never used them, but have heard them well spoken of by those who have.

J. H. R., Scranton, Pa.—Can you inform me where I can find a good assortment of hunting pictures—quail and partridge shooting, etc.—as I wish to purchase a pair of such pictures; size, not over 12×14 inches. Ans. Write to J. M. Tracy for catalogue of his pictures. We do not know of many good pictures.

S. M. N., New York.—Have the State Fish and Game Commissioners made a report of the year's doings, or is there any way of finding out what the sectional protectors have done during the past year? Ans. The report of the Fish Commissioners of New York is now in the hands of the State Printer and will soon be issued.

J. B., Brooklyn, N. Y.—Is the species known as Audubon's warbler extinct (*Dendroica auduboni*)? If not, is it only occasionally seen and what is its habitat? Ans. A very common bird from the Rocky Mountains to the Pacific. Further East, accidental. The wing you send belongs to the American goldfinch or yellow bird. (*Astragalinus tristis.*

C. B., Taunton, Mass.—What is the best way to raise goldfish? Can their eggs be taken and hatched in trays? Ans. Get medium-sized bright fish and put in a pond where there are water plants and where the water gets warm. They will spawn in May or June and hatch without care. The young are brown the first year, and in some waters longer. Their spawn is glutinous and cannot be handled on trays as some other eggs are.

RAMBLER'S CLUB, Chelsea, Mass.—1. Which is the best place in Massachusetts, both as regards gunning and fishing, for a party to go camping? 2. Which is the best place in Maine for a party to spend a few weeks gunning and fishing? 3. Where is the best camping ground in New Hampshire? Ans. You give no idea as to the season of the year at which you wish to go, and it is therefore impossible to answer intelligently your questions. In Massachusetts there is fair gunning for shore birds on Cape Cod. Grouse and quail near Plymouth. For information about Maine resorts write to Kennedy Smith, Eustis, Maine. New Hampshire shores of Lake Winnepissaukee or among the Green Mountains; almost anywhere.

SUBSCRIBER, Brunswick, Ga.—1. Please let me know where I can purchase from 100 to 200 live quail for stocking purposes. 2. What is the largest squid on record? 3. How often does a bitch get in heat? 4. How long from time should she be locked up? Ans. 1. Write to Chas. Reiche & Bro., Chatham street, New York. 2. The largest entire squid that we know of was in the New York Aquarium. It was forty feet long. It may now be in Coup's Museum and Theatre, Chicago. 3. Generally twice a year. 4. About three weeks.

G. E. S., Fredericton, N. B.—1. There is a certain lake not far from this; it is about half a mile long and a quarter long, very pure good water, entirely fed by springs, no inlet and not much outlet except for about three months in the year when the water seems to rise a bit. In about one-third of the lake a line 160 feet long cannot find bottom, the rest of the lake is from six to twelve feet deep. There are in it now some black bass and trout. What would be good fish to stock it with, both in a sporting and "mouey" sense of the word? The lake, I believe, has a muddy bottom. 2. As I am thinking of going on a trip on horseback in a short time, please send me any information upon bridle, saddle or camping out which might be of use. Ans. 1. We presume that the fish already in the lake will do better than any other kind. Should think that trout especially ought to do well there. 2. Would recommend a heavy leather headstall with rings and snaps at the sides, so that the bit could be taken off without removing the headstall. There should be a ring beneath the jaw to which a rope could be attached. Use a Californian or Mexican saddle, but get one that comes somewhere near fitting you. There are many works on camping. See list of books we publish. We have not the space here for an essay on the subject.

DESIGNER, New York.—1. Is the rock bass mentioned in your paper the striped bass? 2. Are the parties right who say they are caught with the fly? I remember one day last April catching a fine striped bass upon a hook which had a piece of scarlet worsted, frayed out, tied to the snank, and was baited with clam. The day was cold and gray and the water wild, with wind blowing off shore, tide flood. Writing about bass reminds me of some which I caught last fall, the gills of which contained a hard bony bug, which, when put upon the finger would take a firm hold upon the flesh and were hard to remove. 3. What are they? 4. Where can menhaden be obtained in this city? 5. The planting of salmon in the Hudson, mentioned in one of last year's papers, was it done, and will they appear in the Hudson in 1885, or will they seek the native stream of the parent fish as the ex-Commissioner of the Canadian Fisheulture asserts, and be seen in the Hudson no more? Would they be seen breaking water in the lower Hudson as well as upper part? Ans. 1. No. The rock bass is a fresh-water fish, seldom reaching a pound in weight. As the striped bass of the North is called rock, and rockfish in the South, the two are often confounded. 2. The rock bass, *Ambloplites*, takes the fly. 3. A crustacean parasite often found on fresh-water fishes. 4. Of E. G. Blackford, Fulton Market. 5. The salmon were planted and may return. There is no probability of their seeking the Penobscot, from which they came. They would be apt to show in the lower Hudson if they return.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF
Horses, Cattle, Sheep, Dogs, Hogs & Poultry.

For Twenty Years **Humphreys' Veterinary Specifics** have been used by **Farmers, Stock-breeders, Horse R.R., Travel'g Hippodromes Menageries** and others with perfect success.

LIST OF SPECIFICS.

A.A. Cures **Fevers** and **Inflammation**, Milk Fever, Spinal Meningitis, Hog Cholera,	75c.
B.B. Cures **Founder, Spavin**, Stiffness,	75c.
C.C. Cures **Distemper**, Nasal Discharges,	75c.
D.D. Cures **Bots** or **Grubs**, Worms,	75c.

FISHING RODS.

Having been the pioneers in the manufacture and introduction of Section Bamboo Rods, we have always taken great pride in securing and perfecting every improvement in order to maintain our position as the makers of the very best rods. Knowing not only theoretically, but also by long experience, that a properly made round rod is the only absolutely perfect rod, we have invariably refused, and still do refuse, to put our name on any but our "Best" round section rods. Our prices for these round rods average only about 40 per cent. more than the prices asked by any other makers, while the rods are widely known to be *incomparably superior*. While no hexagonal or any angular) rod can be perfect, we long believed that with proper workmanship and material a *really good* angular rod could be made. Being much easier and cheaper to make than round rods, we hoped to be able to offer to those anglers who can not afford to pay the price of our "Best" round rods, a hexagonal rod that would be good and serviceable at a moderate price. We are more than satisfied with the success which has attended our efforts, for we are now able to furnish a hexagonal rod that is really worth having, and at a price which is only a trifle in advance of that asked by other makers.

In addition to the many styles of round and hexagonal Section Bamboo Rods, we wish to call the attention of anglers to our large variety of fine Ash and Lancewood and Greenheart rods. *Every rod guaranteed absolutely hand made.*

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for 120-page illustrated catalogue.

ABBEY & IMBRIE,

48 and 50 Maiden Lane, New York City.

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

For price list address

F. LATASA, 35 Broadway, New York.

PHOTOGRAPHY MADE EASY.

The Tropicals (dry plates) are the only ones that can be used successfully in warm weather without ice.

Remember the negatives may all be developed on your return home.

The lightest, most complete and practical of Amateur Equipments. Price $10 and upward. E. & H. T. ANTHONY & CO., 591 Broadway, N. Y. Send for catalogue. Book of instructions free. *Forty years established in this line of business.*

PURCHASE THE BEST.

Send for catalogue giving full information about hunting goods, particularly **Hunting Boots and Shoes**, manufactured by

MANUFACTURER AND DEALER OF

Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.

Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., $1.00; 120ft., $1.25; 180ft., $1.50; 240ft., $1.75; 300ft., $2.00; 450ft., $2.25; 600ft., $2.50. Any of the above Reels with Drags, 25 cts. extra; nickel plated; 50 cts. extra. Brass Click Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., $1.00; nickel plated, 50 cts. extra. Marster's celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sproat, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Aberdeeen, Sneak Bent, and all other hooks. Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders. 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 60 cts. per doz. Black Bass Flies, $1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, $1.25 to $5.00. Trout and Black Bass Fly Rods, 10ft. long, $1.50 to $10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S
Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

101 & 103 Duane Street, New York.

AT THE LONDON FISHERIES EXHIBITION

THE NICHOLS
Hexagonal Split Bamboo Fishing Rods

Were awarded **Three Silver Medals** and the highest special prize—**10 Sovereigns.** Noted for excellence more than numbers. This is the highest prize awarded to any American for Split Bamboo Rods.

Manufactured by B. F. NICHOLS, 153 Milk Street, Boston, Mass.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, MARCH 27, 1884.

VOL. XXII.—No. 9. Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Some Final General Remarks.
ANSWERS TO CORRESPONDENTS.

IN A RECEIVER'S HANDS.

THE Yellowstone Park Improvement Company is in the hands of a receiver. It is stated that the motion for a receiver was made at the instigation of Rufus Hatch, who is believed to be the largest creditor of the concern. Just what the exact facts of the case are, cannot now be known, but, as reported, it stands something like this: The application for a receiver was made in Trenton, N. J., before Judge Nixon, of the United States Court, by Charles E. Quincy, a stockholder and creditor. Mr. A. L. Love, cashier of the Stebbins Bank, of Livingston, Montana, which is a creditor of the company to the extent of $13,000 or $14,000, was appointed receiver, and will for the present manage the affairs of the company for the benefit of the stockholders.

The liabilities of the concern are stated at $210,000, against which they have the hotel and furniture, which cost $150,000, some few horses and cattle, and some sawmills built on Government land and used to saw for themselves timber belonging to the United States. Rufus Hatch claims to have advanced $112,000 out of the $130,000 expended upon the project, and instigates these proceedings for the protection of this claim.

The readers of FOREST AND STREAM are pretty well acquainted with the history of this company, but we may give some additional inside facts about it. Among the incorporators were a number of prominent men, but they were only figureheads, and the real parties in interest were Rufus Hatch, John Douglass, C. T. Hobart and Henry Douglass. John Douglass is the brother-in-law of Senator Windom, who made such a strong fight to have the Park given up to the exclusive use of this company. It appears now that these partners have fallen out, and John Douglass tells the story of the final rupture as follows. After stating that negotiations had been in progress to pull the concern out of its difficulties, and that Hatch had promised to await the issue of the pending arrangements, he continued:

"The question of the settlement of the affairs of the company depended largely upon the temper and intentions of the creditors. If they were disposed to wait and be accommodating, there were two parties, one living West on the Northern Pacific and the other in New York, who were ready to put up the $30,000 Mr. Hatch demanded as a condition precedent for his retirement from the company. These two gentlemen were absent on an extended trip and were delayed thereon. I telegraphed Mr. Hatch, and received a reply from him dated New York, March 6. Here it is. Read it for yourself. You see it says, 'Will wait ten days for a proposition from you.' The ten days did not expire until last Sunday, and I now discover that Mr. Love was appointed receiver ten days ago. Arrangements to secure such appointment must have been pending when Mr. Hatch telegraphed that he would wait. The Stebbins Bank, with which Receiver Love is connected, is a creditor to the amount of $18,000, not all of it debts due the bank directly, but on paper they have cashed or bought. I further learn that Mr. Stebbins proposes to foreclose on the property and assume control of the affairs of the company, leaving us out in the cold, but he will discover that he cannot do this easily, as we will fight for our rights."

"Who are 'we?'"

"Well, there are a number of figureheads, of course, but Henry F. Douglass, my son, C. T. Hobart, and myself, with Rufus Hatch, constitute the 'we.' By the terms of a private contract entered into between Henry Douglass and Mr. Hobart on the one hand and Rufus Hatch on the other, the latter was to receive 35 per cent. of the interest in the Improvement Company, leaving 65 per cent. for the rest of us, and this private contract, which will have to be made public soon, is all we have to show for our right, title and interest in the company. By the terms of that contract the three parties named bound themselves solemnly to stand together and protect their mutuality of interest. No important measure to be carried into effect without the consent of two out of the three."

The Livingston, Mont., *Enterprise* says, regarding the situation at the Park:

C. F. Hobart, agent of the Park Improvement Company, at Mammoth Hot Springs, is securing the claims of a few of the creditors, by giving mortgages upon the company's chattels. To one a lien upon the stock of liquors has been issued, and to another security upon the piano at the hotel, and so on. The carpenters who are holding the hotel wish to be secured in the same way, but Mr. Hobart told them he thought they had a good enough thing if they could maintain it without any mortgages.

It was supposed, at first, that this application for a Receiver might have been made for the purpose of arousing sympathy for the broken down company, and thus influencing legislation at Washington in their favor. This does not appear to be the case, however, and since it is seen that the only sufferers are the speculators who went into the scheme with their eyes open, we presume that very few tears will be shed on their account. If all that is said is true, the only heavy loser is Hatch.

It is to be hoped, however, that whoever manages it in the future will have a little more regard for the rights of the Government and the people than has been manifested by Hobart and Hatch; certainly whoever he may be he cannot have less than they did.

UNHEEDED LESSONS.

WHAT is the lesson which the floods of the winter teach us? A few weeks since, the sympathies of the country were stirred by tales of the suffering along the Ohio River. Now we learn that the valley of the lower Mississippi is a vast inland sea, that farms are many feet under water, that stock is drowned, that men, women and children are living on rafts and in the lofts of gin houses; that, unless Government aid is extended to these poor people, they must starve. This aid should be sent them. It cannot be done too quickly.

The tale is a pitiful one. It is also an oft repeated one. But no remedy, except the ancient one of building dirt walls, which are washed away as soon as the water reaches them, is suggested. Occasionally a seeker for a fat contract at Washington proposes to wall in the river from source to mouth. Still the destruction of the forests goes on, and will continue until the burdens of the unhappy people who dwell on the banks of the Ohio and the Mississippi become too great to be longer borne. When the annual floods have depopulated this great and once fertile and prosperous region, then our sluggish legislators may be induced to take some action. In the mean time, God help the poor people in the Southwest, whose possessions are annually destroyed by the floods.

Our law givers are slow to learn. They follow public opinion, never lead it. And until the public sentiment shall demand in unmistakable tones that our fields and hills be reforested, the law makers may be trusted to do nothing. From the valleys of the Ohio and the Mississippi, where the terrible effects of our criminal waste of the woodlands are fast making themselves felt, will come the cry for protection from floods which are annually more dreadful, and this cry will be taken up sooner or later all over the country.

This protection must be on a scale commensurate with the forces to be resisted. As well attempt to bind the ocean in fetters of brass, as to confine with levees the Mississippi, when, swollen by the precipitation of half a continent, it hurries toward the Gulf. We may curb the waters when they are raindrops, or tiny rills, or springs, with some prospects of success, but to restrain the Father of Waters when once he has burst his banks, is impossible.

The case is a plain one and demands attention from those in power. Even if it were taken in hand to-day it would be years before the full effects of the reforesting would be felt. If some measures are not at once adopted by the Legislatures of the different States and by the general Government toward the establishment of forestry commissions, and an intelligent and universal tree planting, the losses from floods will each year become more severe, and portions of our territory, once reckoned most fertile and valuable, will be deserted by their inhabitants, and become mere waste land.

The people are slow to learn, but it seems as if the lessons of the present year must have taught something to those most nearly affected, if not to the country at large. Will this lesson pass unheeded? Will another more severe be required?

OPENING OF THE TROUT SEASON.

BEFORE we go to press again, the trout season will be opened in the State of New York. That is, it will be legally opened all over the State, although in fact few waters, besides those of Long Island, will be actually fished. There are enthusiastic anglers who would fish on the coldest day in mid-winter, if the season was lawfully opened on that day, and who will fish Long Island waters on the 1st of April, no matter how much the east wind may whistle about their ears. Others, more sensible, will await the coming of weather fit for angling, when they can cast their lines without suffering, and we will wait with them.

The fishing-tackle dealers are busy in filling orders, and in showing the novelties in tackle that have been put on the market since last year. In this line there is nothing particularly worthy of note outside of reels. Several new reels are out, and they seem to combine all that an angler can wish for. We think there has been a great improvement in reels within the year, and it would seem as if perfection had at last been reached. The curbstone dealer in walking-cane rods has not yet made his appearance. By the time the angle worms get to the surface, and begin to bask in the moon's cool rays, he will be out with his traps to sell to boys with more pennies than judgment, and who will show their companions their "genuine Japanese fishing-rod which shuts up into a bully cane."

The trout exhibition at Blackford's, in Fulton Market, will be up to the usual standard, and will repay lovers of trout to inspect. Trout of all sizes, ages and colors will be present from all parts of trout-bearing America, as well as from some parts of Europe. Truly the 1st of April in New York City is the anglers' holiday.

STOCKING PRESERVES. — We understand that Messrs. Reiche & Bro. have furnished, during the past winter, over two thousand live quail to parties who desired to turn these birds out for the purpose of stocking their grounds. Of these, it is said that more than one-half have died in captivity, through the ignorance or neglect of those who had them in charge. In many cases the birds were not supplied with gravel, and in others no greens were given them, and they soon succumbed to disease. The hints published in these columns a few weeks ago should have been more carefully observed. For Mr. Lorillard's preserve in New Jersey a number of English pheasants have been imported, as well as a lot of English partridges, and arrangements are being made for a large shipment of prairie chickens from the West. All these moves are in the right direction and it is to be hoped that they will be crowned with success.

WOODCOCK IN THE CITY.—Last week a dead woodcock, which had flown against the telegraph wires, was picked up by a hackman in the Bowling Green in this city. Another, killed in the same way, was found in a gutter in Canal street. Both were large birds and in good order. In Newark, N. J., one was found dead on the roof of a piazza, having evidently flown against the house during the night and dropped down on to the roof, where it was found the next morning. The last of the birds are moving along now. Many have been here for nearly a month.

"WOODCRAFT" is in an advanced state of preparation, and will probably be ready for delivery in less than two weeks' time. Judging from the enthusiastic letters which we receive about it, old "Nessmuk's" book is going to have a boom.

AMATEUR PHOTOGRAPHY.

MANY of the readers of FOREST AND STREAM will no doubt take with them on their summer tour or vacation a camera. Those who expect to do so should purchase it now, and devote some time to practice, before going into the field to take views. The experience gained in this way will be of great value to them, saving many failures, and enabling them to bring home a good set of views, instead of a lot of plates, which, through the lack of knowledge of the operator, may, when developed, produce results altogether unsatisfactory.

There are plenty of books devoted to the subject of Amateur Photography, and the beginner will, of course, study them for information on the subject. The following remarks are intended merely to give certain hints, which are not found in the books. The trouble with such volumes usually is, that they are written by professional photographers, to whom the business is an old story, and who, because they know all about it, take too much for granted, and assume that the minute details of the work are known to every one. They are not simple enough. The writer is an amateur, self-taught, and hopes, by mentioning some of the difficulties which he has encountered, to help the readers to avoid or conquer them. As he is writing entirely for beginners, some definition of the terms used may be given. The

Lens is the disc of glass at the back of the tube, through which the light reaches the glass plate, which receives the picture. The

Tube is the metal cylinder, through which the light comes to the lens, its purpose being to keep out all side lights, and to admit only those from directly in front of the lens. The

Cap is the covering for the open end of the tube, by the application of which all light is excluded from the camera. The

Drop is a cap, perforated with a small hole in its center, and closing with a spring. The

Ground glass is a plate of this material in a frame at the back of the camera box. It receives the image of the picture through the lens, and the operator, by looking at this reflection, is enabled to decide whether his instrument is properly focussed or not. The

Camera is the box with bellows and slide, and when ready for use has the lens in position in front and the ground glass at the back. The

Tripod is the frame of three jointed legs, on top of which the camera rests and revolves. The

Plate holder is a light-tight frame, into which the plates are put for the purpose of exposing. The

Shields are slides, usually of pasteboard or thin wood, which cover the plates when in the holder.

Since the lens forms the basis of all good pictures it is of the utmost importance to get a good one. It is much better to spend money on this, rather than in procuring a showy outfit. With a cheap, camera but a good lens, you can get excellent results, and the lens can be used for a camera of different size, if you should wish at any time to take larger views. When you have obtained your instrument, and know how to put it together and take it to pieces, it will be well to go out of doors and learn to set up and take down your camera, so as to be able to set it up on a level, or square. The base line of the picture should be parallel to the lower margin of the plate. Practice looking through the instrument at the landscape, and be careful to get a good proportion of sky, fore and back ground. Face the instrument to the view you wish to take, put the ground glass in position at the back of the camera, and then look through it, covering the head and back of the instrument with a dark cloth, so as to exclude all light except that which enters through the tube. Looking toward the light before you, you will see on the ground glass the picture that you wish to take. If you should see nothing, slide the back of camera—and so the ground glass—backward or forward until you do see the image. Then adjust the camera by a screw in the position in which the image appears most distinct. This is called focussing, and is the same operation which you go through when you use an opera glass. In focussing, always select some definite, distinct object, and be sure that this object is sharply defined on the ground glass. Now move the camera on the tripod to right or left, still looking through the ground glass with the head and instrument covered with a dark cloth, so as to exclude all light except that which enters through the tube. Observe the effect of the shadows and the light, and you will very likely find that by taking in some additional object or through the changes of light you will have a much better picture than in the first position. The light often strikes the angles of a house in such a way as to make the shadows very dark, and to spoil what would be a very good picture if taken in a different position. Never face your camera so that the sun will shine into the tube, for this will throw the shadows in the wrong direction. Deep shadows and bright objects do not time well together in the same view. The exposure will be too short for one, and too long for the other.

In taking off the cap, do it quickly, but without jarring the instrument, and carry the hand down and toward the tripod, not out in front. In returning it, catch the tube on the lower side first. When the drop is used, no discretion as to time can be exercised, but as the drop can be used only in a strong light, you often have to work with the cap. It is necessary, then, to time the exposure, and as it is not always convenient to hold a watch, you should learn to count by seconds. With a little practice you can learn to count accurately. Not one in fifty can do so without practice. The time for exposure depends on the strength of the light, the rapidity of the plates, the time of day and the time of the year. From 9 o'clock to 4, in the bright days of summer, the light is stronger than at the same hours in winter. The reflection on the ground glass will enable you to judge of the strength of the light. If the objects come out strong and clear, the light is better than when the objects are dim. If the plate is exposed for a sufficient time, say twenty to thirty seconds, a picture can be taken, even though the reflection on the glass is scarcely to be seen; but when the colors and objects are bright, a flash of light through the lens is all that is required with the instantaneous plates. It requires judgment and practice, therefore, to time the exposure.

To test this, place a plate in the camera. Remove the shield next to the lens, cap and uncap as quickly as possible. Now push the shield about one-third of the way into the holder, and expose the plate, according to your judgment, and cap; push the shield in a little further, making two-thirds of the way in, and expose say one second and cap. Now push the shield into position, and you have a plate exposed to three different spaces of time, the longest time being at the small end of holder. Develop until the picture begins to sink, and, after fixing, you can then judge which part was timed correctly. The instantaneous plates are the best for general use, as they can be used with either the drop or cap. When you have become accustomed to timing them, do not change the kind of plate that you have been using, as all your experience will be lost and will avail you nothing with a slow plate—that is, as to time required for exposure.

Mark your shields "exposed," and when you put the plates into the holder, have that side of shield next to the plate. After exposing the plate, turn the shield and put it into the holder with the word outside. By this plan, you will not forget that the plate has been exposed, and will not take, or attempt to take, two pictures on the same plate, when they are only made for one.

When away from your base, or in camp, it is not necessary to have a ruby light, unless you want to develop your plates. Try this plan. In the daytime or with any light, place your shields in the holders with the word "exposed" inside. Cut the paper that confines the cover on your box of plates, then put the box and holders on some board, or on your bed, where you can work. When it is dark, take out the shields to holder, by feeling, then remove a plate from the box with the right hand, not touching the face of the plate, but holding the edges between the thumb and fingers. Then, with the thumb of the left hand, scratch the corner of the plate. If that is the film side, it will chip; if the glass side, the nail will slip. Take the slide in the left hand and put the plate into it with the film side out. Keep the box and the mats, and return the plates to the box with mats between them after exposing. Wrap the box in paper, and develop at your leisure. Never remove an undeveloped plate except in the dark—not even in the moonlight—or in a ruby light.

Plates can be put in or taken out of holders in a dark closet in daytime, if no light is allowed to touch them.

Owing to the suction of the water and the smooth surface of the bottom of tin developing trays, plates often stick, and are difficult to remove from tray. This can be avoided by making two or three slight dents, made from the under side, in the bottom. You will then be able to get the finger under the plate and remove it easily. Always keep your lens well protected from the dust, and be careful not to scratch it. Dust it off with a fine brush or by blowing on it; never rub with cloth or paper.

The following is one of the latest and best formulas for developing:

A—Pure carbonate of potash (free from chloride)	90	parts.
Water	200	"
B—Pyrogallic acid	12	"
Sulphite of soda	25	"
Citric acid	1½	"
Water	100	"

To develop a 5x8 or smaller plate, to three ounces of water add sixty drops each of A and B. If a stronger contrast, deeper shadows, are required, drop a few drops of B into your graduated glass and pour the developer in your tray into glass and return to tray. Never add a strong chemical to that in the tray, as it does not get well mixed. When you use the developer for the second plate, if you find you have too much of B, add say half the quantity of water to tray. You can get good results up to six ounces of water.

Unlike the ammonia formulas, this is not unpleasant to use in a confined room, and will not fog the plate. The chemicals can be had dry, and the water added when required.

"THE ANTELOPE AND DEER OF AMERICA."—The eagerness with which sportsmen are calling for Judge Caton's work on the North American deer, shows very clearly how large a proportion of those who enjoy the noble sport of big-game hunting desire to pursue this sport intelligently. It is an axiom that the man who is most successful as a hunter or angler will be he who is most familiar with the habits of the game or fish which he pursues. Most of our readers appreciate this, and since our reduction of the price of this book has brought it within the reach of all, we are not surprised to find the demand for it very large and constantly increasing.

The Sportsman Tourist.

BETWEEN THE LAKES.

Eighth Paper.

BY THE GREEK PROFESSOR.

IT was a beautiful morning when the Judge and the Professor came out from their tent, yawning and rubbing their eyes, and with an indescribable sense of rest in every bone and muscle, such as comes to him who breathes the pure air of Superior. Beautiful! Would that I could describe the scene that met our eyes as we stood at the door of our tent that still July morning. In front of us stretched the calm blue waters of Superior, broken only by that swell whose outline is beauty, and by that hushed roll and sob on the beach that is music to the ear. The air never was clearer, and the blue of the lake and the blue of the sky seemed bluer because of that perfect sea of transparency that lay between them.

Five miles to our left, projecting into a long curve of the lake, was the Grand Portal, the most magnificent of the Pictured Rocks. The sun shone with marvelous splendor on the eastern side of this great portal, opening to our view the huge cavern in its depths, although we were miles away. I gazed with astonishment, for the unseen hands of that strangely clear morning seemed to have lifted, and borne toward us, the massive rock, till it appeared scarcely a mile away. In the distance gleamed the white speck of a sail-boat. Perhaps some of our friends from Munising were coming on a fraternal visit and fish. But the Judge was impatient and the boat at least an hour away. Our excursion had been planned for days, and we would not delay on an uncertainty. The Judge drew his gold spectacles astride his nose, frowned ominously, and wrote on a pine board this legend, "Gone two miles south of Beaver Lake, trouting," and placed it on the table—the first place the strangers would seek.

With jerked venison and biscuit in our wallets, and shot-gun, rods and hatchet in our hands, we wended our way to the bluff on the south side of Beaver Lake. How calm and placid lay the little lake in the virgin bosom of that forest green. To the south the unbroken swell of the green rose till the far-away hilltop seemed kissed by the blue of the sky. In the midst of this rising mass of unbroken forest a ravine seemed to wind its way, trending gently toward the south and west, and in this ravine we doubted not the waters of the creeks we were going to explore found their way into Beaver Lake.

A quarter of an hour's brisk exercise with the paddle brought us to the south shore of the lake. The bottom along this shore is seen distinctly through the clear water, and at times is almost pure yellowish white sand mingled with coarser gravel; at other times the gravel changes to boulders and large stones, and next we glide over an interval as smooth and solid as a marble floor, for here the smooth sandstone is washed clear of all débris. For a goodly distance the bank along this shore is about a yard in height above the level of the water. Portions of this bank to the very water's brink are thickly set with white cedar trees, some standing erect and others leaning far over the bosom of the sparkling waters. Other portions of the bank, when viewed from the distance of a few hundred yards, look as if a solid wall of rock had been raised a yard high by the masterly skill of the mason, but, on nearer approach, you find it a wall of boulders as large as a man's head, laid with great regularity and evenness by the hand of those great storms from the northwest which so frequently heave the bosom of this little inland lake. But all at once an exclamation came from the Judge:

"A deer!"

"Where?" said the Professor.

"To the west of us, just around the point and the dipping cedars," was the calm reply of the Judge.

"Get your gun ready and I will bring you near enough to get a shot," and his pole grated on the sand and the boat shot forward steadily, and the Professor held his gun in a firm grasp. But the story has been told, and with only such embellishments as the Judge's long experience in the intricate windings and technicalities of law would logically necessitate. Suffice it to say that with the deer in the boat, and the boat upon the bank among the cedars, and compass in hand the Judge and the Professor were soon moving due south.

A quarter of a mile of dense white cedar being passed with great difficulty and toil, we found ourselves at the foot of the bluff and the beginning of the hard-wood timber. As we climbed the hills, now following the windings of ravines as often as they bore in the direction whither we were going, and now following the narrow but well-trodden runway of the deer, we often paused to admire the beauty of this virgin forest, and to stand in amazement beneath the high-reaching branches of some hoary denizen of the woods. How beautiful and smooth and shapely were the beeches, and how the birches reached upward toward the light. And maples! such maples. In my boyhood in Indiana I thought I had seen the prince of sugar trees, but never have I looked up into such towering and wide-spreading sugar tree tops as I did that morning. The memory of the vision of those large maples haunts me to-night in my study. There were but few of the exceeding large ones, many of the beautiful smaller ones. After, perhaps, a half mile of rolling land, the Judge in front struck one of the wildest and thickest swamps we ever saw. The undergrowth was small, but as thick as the quills on the back of that porcupine which the Judge did not kill in the midnight watches. Rod by rod the Judge hewed his way into the midst of the tangle, throwing the half severed saplings to the right and the left until, almost before we were aware of it, we were on the banks of the first branch of the creek we sought. It might almost be said upon the creek, for it was scarcely more than eighteen inches wide, and about as deep, and frequently, for a few feet, would vanish under the roots and moss of the swamp. The water was clear, cold and sweet, and fishing it for a few rods some very prettily marked, though small, trout were taken. Leaving this creek, and still pressing toward the south, the Judge, still puffing and panting, emerged from the swamp and rejoiced to move on more easily over the rolling hard wood timber land. Mingled with the hard-wood here were some giant white pines, lifting their skeleton arms high above the surrounding forest, for they were dead. I could but pause beneath them and look up and wonder what vicissitudes of human life they could tell of if they had speech. Others again were green in a vigorous old age, and here and there were groups of large hemlock, the largest trees in the neighborhood excepting the pines.

All at once the Judge paused and, with a comforting tone in his voice, asked:

"What do you most desire?"

"Light," promptly responded the Professor.

"With the assistance of your legs I will soon bring you to it," was the laughing reply of the Judge.

"Look forward yonder and to the left and you will see the opening." The last words of the Judge were fairly drowned by his impetuous charge through the bushes, and the joyful Professor followed close in the rear. A few moments later we stood in the opening, and beneath the glaring sunshine, gazing at the beautiful green of the beaver grass and the scattered clumps of alders.

"There are trout there!" shouted the Judge, as he pressed forward into the meadow.

"Slosh, clug, plug, ugh!" from the Judge, as he floundered in the meadow half knee deep in the water, for the banks of the little creek were in many places on a level with the water, and the roots of the grass were covered as in a freshet. The joints of our rods were soon together, and we were on the soft springy margin of the creek casting for trout, and taking them too.

The creek here is from two to four feet wide, and about the same depth, occasionally spreading out into a shallow pond. From the narrow and deep channels under the edge of the sod, we lifted some very pretty though small trout. Following the stream downward you soon pass from the beaver meadow into the cedars, and thence out again into tangled thickets of black alder, and almost every rod of the creek contains trout, small, but increasing in size as you journey toward the lake. The adventurous trapper has been here after the beaver, whose haunt we discover in the decaying dams over the creek, and cut logs along its bank. We found the trapper's little hut, and in a reverent attitude—for the door was so low he had to enter on his hands and knees—the Judge explored the interior, finding beaver teeth and hoops for stretching the skins.

This main branch of the creek was fished by the now wearied Judge and Professor for perhaps a mile from the first beaver meadow where they struck it, with constantly increasing numbers and size of fish. But the sun is gliding rapidly into the west, and our legs are weary with riding the black alder. The Judge calls a halt. There is at least a mile more of creek between us and the lake, and extremely slavish walking on its banks. The Judge takes his bearings, decides about where the boat ought to be, and boldly plunges through the grass, black alder and swamp, to the rolling ground a hundred yards away. The Professor soon follows, and as the Judge disappears over a hill he shouts:

"Hold on, Judge, you have certainly made a mistake. You are bearing too far to the west."

The Professor's legs were tired and he wanted to halt the Judge till he could catch up. The Judge pulled his spectacles down, sighted through one glass at the sun, swept the woods to the north with a quick glance, looked into the compass and only said, "I am right," and rolled on. The Professor smiled sadly, but with confidence in the Judge, pressed on. On, on, up hill, down hill, through the ground hemlock, which now and then clutches your feet like a vise, the unwearied Judge strides. The Professor is in despair, and on the point of calling a halt to rest, when the Judge pauses at the foot of a hill and calmly wipes his steaming brow, until the Professor comes up, or rather down, into the ravine. That was a beautiful little ravine in which they halted, stretching backward and upward into the hills, apparently losing itself in the deeper shadows beyond. It was somewhat open where they stood, and a few rods below we could hear the gurgle of the brook which they had left a half mile back. It had doubled on them. Down through the middle of this ravine there came a little tiny brook of clear, sweet, spring water. Just below were a few lily-pads, and just above an old limb of a tree lay on the seemingly innocent soil.

"Well, I am going to cross above there," said the Judge.

"I am going to cross right here," said the Professor. "A straight line is the shortest distance between two points."

The Judge moved off. The Professor lingered a moment to make up his mind and then started. One, two, three steps, and the Professor found himself in the yielding mud up to one knee and with a grunt of disgust backed out. Just at that moment there came a voice from above.

"Ho! Professor, come here, I am in a tight place."

"It seems rather loose around where you are, Judge, what is the matter?" innocently asked the Professor, for the Judge had not seen him back out, nor heard his expletive.

"Well," said the Judge with more emphasis than the occasion would seem to warrant, "I am here, and can neither advance nor retreat. In front the bottom has entirely dropped out, and the old limb in the rear is so small and smooth that I am afraid to attempt to turn back."

"Well, what are you going to do about it?" said the Professor with a chuckle, for he always enjoyed seeing the Judge in a dilemma. "Are you going to camp there for the night?"

The Judge's only reply was, "Cut me a pole and throw it to me and I will bridge the rest of the way across." With these words the Judge flung the hatchet with a spiteful force, not at the Professor, but at the solid earth behind him.

Very leisurely the Professor picked up the hatchet, and more leisurely began to select a suitable grub; for was he not tired, and was not the Judge calmly awaiting his actions? Did not the Professor know that the Judge would not get away from him?

"Hurry," said the Judge, "it is getting late, and I am tired of standing here."

The Professor hurried a little, but he knew the Judge would not leave in a hurry, and so he kept trimming the pole. In order that it might more safely support the Judge's weight, the Professor had left here and there a projecting limb a foot long.

"It is ready, Judge," said the Professor.

"Reach me the end easy," said the Judge, "easy, or you will push me off."

There was no malice in the Professor's heart, and he did reach the end easy to the Judge, and in doing so slipped off the end of the limb with one foot and was half knee deep in the mud. He was just opening his mouth to let escape some of the emotion swelling within, when there was a desperate plunge, a grunt of anger and disgust, a splash, a groan, and then—perfect quiet. One of the projecting limbs had caught the Judge's leg when he threw the pole forward, and obedient to the impulse he followed. The Professor looked forward, and in amazement broke out:

"What on earth are you doing there?"

"Doing nothing. It's already done," said the irate Judge The Professor took in the situation, saw it was impossible for him to go any deeper without bisecting himself, for he had caught on his pole with one leg. Then the Professor was too full to hold in longer; the woods rang with his hearty laugh. Then he forgave the Judge his exaggerated story about the squirrel rifle and the "buck ague," forgave his omissions, that he wounded the huge buck, that he did put powder behind every ball—all these things the Professor forgave, and remembered them against the Judge no more. The Professor laughed till he was so weak he could hardly stand, and the tears came into his eyes. Finally he gasped out:

"Why don't you get out?"

"I want to bring my shoe with me," was the panting answer of the Judge. He pulled and panted, and grunted and groaned, but with no appreciable effect. The Professor was in the background applauding, encouraging, laughing till his sides ached.

"I am coming, I am coming," shouted the Judge after a second attempt. "I am coming with my shoe on, too," and something of the Judge's hearty good humor began to beam on his face. A long and steady pull and he stood with both feet on the pole, dripping with mud and water, and sweating at every pore. A moment more and he stands safely on the other shore, and the Professor, laughing at his sorry plight and murmuring to himself, "The wicked stand in slippery places," cautiously follows the Judge's path without his misfortune.

A brisk walk of half an hour brings us to the brow of a hill, and away across the tops of the cedars gleams the water of Beaver Lake. But such a half mile of swamp as lies between us and the boat! The Judge plunges boldly in and the Professor follows close behind. The cedars stand so close together that the Judge can with difficulty press his 220 pounds through, and the tough dead limbs come so near to the ground that he cannot crawl under. Now, the Professor forges ahead, and part of the time squeezing between the cedars and part of the time on hands and knees, he worms his way along. The Judge groans and then he gives a sigh of relief, for here two or three cedars have fallen down and knocked others with them, and the Judge mounts their trunks and walks with comparative ease. The Professor has wormed his way on hands and knees ahead, and then another lament from the Judge salutes his ear.

"I don't believe I can get through," says the Judge with a comical smile, bordering on the pathetic.

The Professor looked up, and there, fifteen feet in the air, was the Judge, swaying to and fro on the last partially fallen cedar and looking in despair at the Professor on his stomach, crawling through the seemingly thicker cedars, and satisfied with his 125 pounds of avoirdupois. He was in too close a place to speak. He gave an encouraging smile to the Judge and then crawled on, for he had caught a glimpse of the water just beyond. Hot, exhausted by his toil, hounded by the demoniac mosquito, he sank on the mossy margin of the lake and waited for the Judge. He soon came, but had miscalculated as to the location of our boat. It was at least a quarter of a mile to the west of us. What was to be done? The Professor sat still in quiet contentment, for that was the Judge's problem. He quickly began its solution.

"Shades of my fathers," said the Professor, when he turned his head a few moments afterward to look at the Judge, "is it possible that this is the learned Judge, the eloquent advocate, the cultured and genial gentleman whom I so frequently meet on the streets of our city and at our college commencements? It cannot be."

Such were, or ought to have been, the communings of the Professor as he gazed on the Judge. There he stood in the margin of the lake. His woolen shirt, bound at the throat and thrown back, exposed a breadth of breast inviting to the mosquito. His face was damp with sweat and red with the toil of his journey. His shoes lay on the moss, and his jean pants were rolled high above his knees. He reminded the Professor of a Greek gymnast ready for the race. He soon disappeared around the curve of drooping cedars to the west of us, his legal heels grinding the loose pebbles of the shallow waters into the yielding sands. The time slips rapidly away, and the Professor looks longingly across the lake to the northern shore, beyond which lies the camp. A quarter of an hour passes, and the Judge in the little Wawa glides around the little curve of cedars and into the shore, where sits the wearied Professor.

He entered the bow of the boat, stepping across the body of the much-slandered deer—for one of the balls had hit just where the Professor aimed—and taking the paddle, joined his to the Judge's lusty stroke. The boat shot forward toward the distant shore, and in a few moments we were out of the calm and into the ruffled waters. It then became apparent to the Judge and the Professor that the waves were much higher than they supposed. An uneasy look swept over the face of the Judge, and a thought of home, of wife, of children came gliding into the mind of the Professor. It was cold, quite cold, down in those deep blue waters, for a crest of an angry wave spit its foam on the hand of the Professor as he bent to his oar.

"Judge, can you swim?" at last said the Professor, coolly.

"Not a stroke," said the Judge, with an unusually kind tone in his voice.

"Can you?" was the next question from the Judge.

"Like a fish," was the laconic reply of the Professor as he bent to his stroke.

"Suppose my oar should break," said the Judge, gently; "we would be in a bad fix then. But I believe," with a more hopeful tone in his voice, "I could make it with the pole for a paddle."

The Professor made no reply, but looked ahead to the rising waves and to the bluff beyond them.

"Ugh!" said the Judge, as a vicious wave cast a pint of water into his lap over the boat's side. Now, the Judge is a Presbyterian, and as their custom is, does not take kindly to water, especially to large bodies; but the Professor is a genuine Baptist, and prefers even a lake to a bowl. These facts may account for the pensive mood of the usually jubilant Judge, but the reader must decide that.

After a perilous half hour's struggle the yellow of the sands gleamed through the boiling waves, and the Judge was his genial self again, and I am not sure that he did not fling a quotation from Blackstone and some law Latin at the angry waves.

In a few moments the Judge, Professor and deer were in camp, and the greetings to our friends from Munising, who had arrived in our absence, Mr. E. C. Cox and Ira Weller, being over, the Judge proceeds to broil the steak. Now, it is one of the idiosyncrasies of the Judge to talk to the pots and pans when he is cooking by himself. The Professor had left the camp-fire a few moments before, but unexpectedly returned. The Judge was talking to himself even more warmly than usual, and the Professor thinks that these were about the words: "That may be all right for a Baptist Professor—be still, won't you"—this last with a vicious punch at the steak, which was curling on the griddle—"but for a liberal Presbyterian who takes his drop at a time, that lake was a little too deep for comfort, and—" here the Professor coughed, and the Judge looked up, and with an innocent simplicity the Professor asked,

"Isn't supper about ready?"

"Yes, it is ready," said the Judge, with rosy cheeks; and he placed the fragrant steaks on the table.

It was a custom of the Judge and the Professor, after the day's toils were over, to light the candles, and retire to their couch, and have some of the delights of conversation and literature. The evening of this busy day was no exception to the rule. For, perhaps, an hour they read with only an occasional remark. The Professor saw the Judge giving now and then a vicious slap at some imaginary fly under his part of the coverings, but without much success. He finally became impatient, and began to turn down the covers as if he were going to annihilate some stubborn juryman. He gave an earnest look through his glasses and, with a yell that would have made a Comanche Indian blush with shame, he bounded—literally bounded—from the bed, striking the sloping side of the tent.

"A snake! a snake!" he cried, and with an energy born of natural disposition and close confinement, he attacked it with a loose tent pin, and in a moment a harmless little garter snake was wriggling its last on the sands of our tent floor. The delights of literature were over for that evening. The Professor laughed till his strength was exhausted; laughed himself to sleep. But the Judge had a troubled sleep, and moaned, and in the silent hours of the night gave the clothes a most vigorous kick, muttering as he did so, "Darn the snake!"

IN THE WOODS, AND OUT.

WHY it seems but yesterday that passing down this path I heard the tuneful wings of busy bees circling along the misty morn to forage on the blossoming fields.

The woods were vocal with songs. The air was ladened with perfume from the flower-crowned hills.

Far, far below, the fog hung in the valley like a lake. Cool, shady groves were on the distant shores, and now and then glad echoes ferried the robin's simple song across the silent deep to me. This, thought I, as I looked away toward the blue hills, around me, is nature's walled city. Builded like unto the city with its twelve great gates, that lies away out eternityward.

And yet I know that to these courts autumn would come and demand the scepter of summer.

Well do I remember on a September evening, when the crimson banners of sunset were streaming from the western sky, how I watched great flocks of birds drifting through the defiles out to the south to join a sorrowing queen that had deserted the halls of day; deserted because the heralds of autumn were telling of the barbarians coming. And oh! what changes were wrought! The landscapes were decked in brown and gray; the forest was despoiled of its dress; flowers were buried in unmarked graves, and when the unleashed whirlwinds of the equinox rolled all that was beautiful into drifts of mouldering ruin, nothing but a specter of the vernal scene was left to me.

But then I soon fell into line with autumn and became as one of the family. I heard the rattling nuts among the limbs; I saw the gray squirrel grow sleek and fat; I watched the wild goose sailing out of the north, and by and by it dawned upon me, what would one do without the music of fall?

Had I not twenty years ago shouldered my three-dollar shotgun and enlisted in the cause? And have I not every season since tramped hill and plain, through meadow and brake, through sunshine and storm, now shooting over a staid old dog in the stubble, now wasting lots of powder practicing on grouse in the thickets, and again cheering on the noisy chase among the hills? Well, come to think about it, the fall is the musical season of the year. But the autumn is gone, and I am looking on the winter's trail. The cold north wind is roaring along the bare ridges and bleak downs. I hear the allied tempests marshalling along the scraggy cliffs, and roaring through the rocky gorge, dance lightly over the waters of the lake, and driving through the woodland with sober pace, awake the genie of the place to chant old winter's symphony. And now again, I hear them masking all their forces on the border of the thicket, and now the whirlwind charges up the dizzy heights beyond the little chapel, and eddying through the guttered fields goes coasting down the gentle slopes toward the southern horizon.

What a vast brotherhood these wintry winds are! I hear their rustling wings on every hand. How they torture the clouds; how they stir the very depths of the laboring sky! Hush! I hear them here and there—and see them never.

Hark! I hear the woodman's axe in the valley. One, two, three, and now a thousand echos take up the measure of the master stroke, and labor's melody swells into a grand chorus to cheer the toiler to the end of day. For sixty years the bright axes of this craft have spangled these slopes; for sixty years the woodman's axe and husbandman's plow have been devastating the primal beauties of these hills and vales; and I now see away in the vista guttered fields and vast tracts of brush, that hear no more the moan of laboring axe, but are simply the home of the wild fox, and Industry's offering at the altar of Folly. The master stroke has an echo away on the borders of civilization, and unless there is a cessation of the music, a century's reparation will be but as a drop in the sea from the sum of our losses.

Save the forests while yet we may.

Down in the fastness of his thicket home I hear the grouse beat a tattoo. How vain is he when he spreads his dapple wing before the chary flock, and yet, with all his vanity, the music of his wing adds a charm to the solitude, nor mars one item of the woods' solemnity. Who has the heart to slip among the shadows and shoot this bird upon the ground or tree, and give not even one chance to his nervous wing to stretch away in flight before the vengeful gun?

Hush! I hear a quail piping a note of warning to his mates. And now I see them racing through the dead grass of the pasturage. I mark one down. There will he lay, and count with fluttering pulse the snail-paced flight of danger's hour, and will only feel from danger free when, in the twilight hour, the wary cock calls to the scattered covey and leads it to the sheltered bivouac.

Ah, Bob! I wasted many a pound of shot before I became very successful in cutting you down. But I never cut you when you were down. You know it was a square heel and toe race, and you know that for several years you won, because I insisted on shooting with both eyes shut.

My footstep startles the rabbit from his nest among the greenbriers, and he drifts away as noiseless as the light of

day. What is there in the sounds down the hollow of the forest gloom that tells of danger? What instinct leads him among the shadows by the brook, through the clearing, down the path to the sugar camp, and stays his feet from circling flight just where I entered the thicket? See how he tracks the danger past his nest, and circling once again to spy the ambush, if one there be, creeps back among the briers to dream away the day. Oh, unseen Hand, thou great Creator, how perfect the workings of Thy laws!

On up the steep path I am climbing. I hear the red fox barking among the rocks above me; I hear the brotherhood of winds tuning their harps amid the swaying, shivering trees, but not a bird cheers me on my way with a note of welcome. Across the valley I see the crow climbing the blast with lazy wing, and perching upon the topmost branch of the highest oak, laughs at the storm. Ominous bird!

Time's corroding touch may scar the beauty of the highest art, time may strew the hills with mouldering monarchs of a royal forest, time may shepherd the deeds of great men upon the highlands of the past, yet time seems never to dim the fire in the eye of this robber drifting upon the tide of idle years, yea, shiftless years; he does no deeds that call for praise; he forms no tender ties to stay his flight, when fancy leads to some adventure far beyond the confines of the day. He haunts the woods, the cliffs, the highest hills, the valleys low and damp, and loves to linger near the cabin home of the pioneer, not, however, to admire the laborer who is studding the crown of poverty with gems of righteous deeds, and who, with toiling hands is sealing within the tomb of day, just acts, that shall be golden recompense in vast eternity, but to steal anything that may be found loose.

Far from the stately city he plumes his ebon wing and patrols all the country side with Saracenic vigilance. No scene too sacred, no borderland to stay the passage of his untamed wing.

Swinging from the elm near the church, he has watched the funeral pall pass to the grave, and when the rattling clods were awakening hollow echoes to read the closing chapter in the book of life, then was his cry the loudest.

Woe to the nestling when his wing shades the nest. Brothers, an ounce and a half of No. 6 shot is always taken at par by the crow family.

Darker and darker grows the day. Great, lumbering old blasts come groaning and complaining over the western hills. The archers of the storm king are feathering the red roof of yon distant barn with arrows of snow. The loud-voiced farmer calls his flock home from the broken hills. Through the drifting storm I hear their tardy feet hastening down the stony path to battened stalls and manger fat with salted hay. The house-wife stands with shining pail in hand awaiting the coming herd. Hissing geese crowd around the corn-crib door and watch the golden stores with hungry eyes; turkeys peep and gobble in the distant orchard; complaining chickens crowd the garden fence, while on the oak, that stands way down the lawn, the peafowl has a perch, and from this airy post will sound the charge for every circling squadron of the storm throughout the night. A bright wood fire snaps and cracks on the kitchen hearth. I would love to sit an hour by the cheerful blaze. I would love to linger longer on this sea, open to winter gales, but a safe harborage from the whirlwinds of passion and ambition that are laying the wrecks of human expectation thick along the shores of time.

But past the farmhouse and the sheltering fold my path leads over the dark fields. Night is scaling the walls of the horizon, and the brotherhood has an old hurricane headed through the portals of the west.

There by that mass of broken stone and scattered mouldering logs, was once the home of the first settler in this "district." There young hands first took up their tasks of life; their necessity ruled and exiled pleasure's cause was never plead. And of the fruits of that forgotten seeding time, we have this desolate ruin, which is the chaff the marching years have left upon the thrashing floor of time. Poor Ben Johnson! They say he loved the woods too well; his gun was his constant companion, and the music of the forest the destroyer of his earthly prospects. His keen eye interpreted the unwritten language of nature, and his soul was jubilant as he heard the Creator's praise syllabled in the song service of the birds. The sturdy arm that blazed a trail up into this Eden wielded a scepter that preserved it for sixty years. But when at last he was laid to rest, the vengeful axe swept away his treasures; and, ere long, some sacrilegious hand erected this legend above his neglected and brier-covered grave, "No Hunting Allowed Upon These Premises!"

Who enjoys more fully, who can comprehend more clearly, the divine wonders of this world than the sportsman wandering through field and wood? Follow him with gun afield, or with clicking reel by the quick waters, and you will find his actions tempered with reason and his eye keenly observant of all that is beautiful around him. Could we have watched Ben Johnson awake to his first sunrise among the blue hills of eternity, is it not possible we would have heard him exclaim, "I thank You, oh, God! that it is Thy pleasure that I enjoy forever in Thy kingdom what was allowed me in life; communion at Thy altar and among Thy subjects!"

Can the human heart conceive grander or more magnificent scenes than the sportsman finds in his travels?

Pardon me for getting into the woods, but I am out.

Parson O'Gath.

Wildfowl in New Brunswick.—*Editor Forest and Stream:* Those who read the first paper on the "Cruise of the Alice May," in the February *Century*, have thereby been introduced by Mr. Benjamin to one of the best sea-fowl shooting grounds in Canada. On both shores of the Northumberland Straits, and along the north shore of New Brunswick, from this date to the middle of May the wild geese, brant and black ducks alight on the shore flats to feed and rest on their way north to their hatching grounds in Labrador. They are hunted and shot from boats about ten feet long, rigged up with side paddle wheels like a miniature steamer. Each boat only accommodates one man, who propels himself with cranks which act directly on the paddle wheels. When he gets near enough to the birds, which he can do readily enough among the huge blocks of floating ice, he seizes his gun and blazes away. From one hundred to one hundred and fifty birds are often bagged in a day in this way by the more experienced gunners, who can stand the wear and tear of that means of propulsion. A few pioneer flocks of the geese have been seen within the last few days. It will yet require several steady south winds and warmer weather to make the shooting season regularly open.—B. (New Brunswick, March 19).

Natural History.

THE DEER OF THE OTTAWA VALLEY.

BY WILLIAM PITTMAN LETT.

[Read before the Field Naturalists' Club of the City of Ottawa, Ontario, Canada, on the 13th day of March, 1884.]

[*Concluded from Page 144.*]

THE common deer, *Cervus virginianus*, so named on account of the species having been first discovered by Europeans in Virginia. This idea was in the mind of Robert Burns when he said:

"Lord, I'se hae sporting bye an 'bye,
For my gowd guinea,
Tho' I should herd the buckskin kye
For't in Virginia."

The Virginian deer is one of the most graceful and beautiful types of the deer genus, and is so well known that it is almost superfluous to describe it. Generally speaking, the male only of this animal has horns. I have seen, however, within the last three years, two does brought to Ottawa market, each of which had small horns, somewhat resembling the antlers of a "spike-horned" deer; and, although the time was late in the season, the velvet still remained on the horns. These are the only instances in which I have noticed horns on the female of this species.

The Virginian deer in form is the most elegant of all the North American deer. The following description is from "Billing's Naturalist and Geologist": "It has a long tapering, pointed head and large, lustrous, bluish-black eyes. The legs are slender but well formed, and in proportion to their size, possessed of prodigious muscular strength, while the body is moderately stout and flexible. The horns are not large, but they are well armed with strong and sharp spikes. They are near their base bent backward, and in the upper half turned forward. They are usually cylindrical, but they are also sometimes met with a good deal palmated. They vary very much in size and shape upon different individuals. The prongs are round, conical, sharp, and directed upward. Situated partly on the inside of each horn, near the base, there is a short brow antler on most of the specimens. A large pair of horns weigh about six pounds, but there are few over four or five pounds in weight.

"The color of this animal varies with the season; in the autumn and winter it is bluish grey, in the spring reddish, becoming bluish in the fall. Beneath the chin, throat, belly, inner side of legs and under side of tail white. The fawns are at first red and spotted with white along the sides. In the autumn of the first season they lose the white spots, and thereafter are the color of the old ones. The hair is flattened and angular, that upon the under side of the tail long and white.

"The average length of this species is from the nose to the root of the tail five feet four inches; length of tail without the hairs, six or seven inches; with the hairs a little more than one foot. The females bring forth in May or June, one, or two, rarely three at a birth."

Occasionally specimens of this deer are found of a pure white color, with the pink-colored eyes, denoting an albino. I have seen two or three marked with irregular patches of white on various parts of the body. On one occasion a few years ago, at Hemlock Lake, in the Province of Quebec, I shot a fine buck, in the skin of which the white hairs predominated so much, that the animal had quite a white appearance. A large doe was killed by another of the party about an hour afterwards with precisely the same peculiarity of appearance. A few years ago Mr. Neil Morrison of this city, had a magnificent white buck, carrying a fine pair of horns. As a *lusus naturæ* in the animal creation of extraordinary elegance and beauty this lovely specimen was unrivalled. The pure and uniform whiteness of the skin of this fine buck was almost beyond belief. This rare and valuable specimen was caught in deep snow when about three years old, about thirty miles up the Gatineau River. It afterwards came into the possession of the Hon. R. W. Scott, who kept it with a number of others in a park, where it ultimately died. If a deer be killed in the water during the period of the red coat, say from June until the middle of August, the carcass will sink to the bottom. At all other seasons the dead body will float. From recent accounts given by sportsmen in Forest and Stream—and intelligent sportsmen are frequently very reliable naturalists—the largest male animal of the Virginian species has been found to weigh something over three hundred pounds gross weight, while it is stated by Mr. Cyrus Butler, of Anna, Ill., that "the Virginia deer of the Pacific States are smaller than those of the same latitude in the Central and Eastern States; and I do not think that the deer of Texas will average more than one-half of the weight of the deer of Wisconsin and Michigan. From all I can learn on the subject, it seems that the Virginia deer of the Western States are smaller than those of the same latitude in the Central and Eastern States, and it is certainly true that the further South we go, the smaller we find the deer."

A beautifully formed deviation in the *Cervus virginianus*, is called the "spike-horn." This animal, although identical in color and habits with the branching horned variety, or rather generic type of this species, is rounder and thicker in body, shorter in legs, and has a more elegantly shaped head than the other. The true spike-horned deer has straight, sharp antlers, of from six inches to nine inches in length, setting backward, like the horns of the African oryx, which renders him a formidable and generally victorious antagonist, in the periodical combats which take place between the male knights errant of the deer tribes. Those conflicts are often desperate and protracted. I have seen a piece of bush fully a quarter of an acre in size, after a light snow, in November, all tramped over, the soil torn up, and small trees—it was in a *brulé*—uprooted in all directions, as the evidences of one of these battles. I was told by a still-hunter on the Madawaska River, who killed 170 deer in one season (how is that compared with the mild and less sanguinary dog hunting?) that the same year—I think 1879—he came upon two fine bucks fighting and, getting in within thirty yards, killed them both; rifle, small Ballard. In such conflicts the animals frequently get their horns locked beyond the power of extrication, and both die of starvation. I once saw two heads locked so tightly facing each other, that a strong man could not separate them.

I am indebted to our friend Mr. James Fletcher, the accomplished botanist of the Field Naturalists' Club, for a copy of the London *Field*, containing a photograph of the most extraordinary head of abnormally shaped horns which I have ever seen. The same paper contains another photograph of two heads locked together, side by side, while fighting, in such a manner that nothing but the shedding of the horns could have freed them. When found the deer were alive and in good condition. In both cases the animals were of the Virginian species. This beautiful deer is found in all parts of the valley of the Ottawa, and between the Ottawa and the St. Lawrence, in such places as the hardwoods and swamps are large enough to shelter them. They roam through the hardwood and hemlock ridges in summer, and make their yards, if possible, in a tamarac swamp in winter. I have seen, about twenty years ago, a deer yard stretching from Bear Brook away beyond the Castor River, which must have been at least nearly four miles square. This yard was completely intersected by paths branching off in all directions and beaten hard enough to bear a horse. Deer yards are found in the same section of country still; but, like the red-skinned herds of woodland beauties which then made the wilderness glorious, they have been growing smaller and smaller; and a well-beaten yard often acres in extent within twelve miles of Ottawa, is now no mean representative of the wide trodden haunts of the Virginian deer in the near past. The multiplication of hunters, superinduced by arms of precision and volunteer companies, but above all the lawless assassin who slaughters them, male and female, old and young, upon the crust, during deep snow, have tended, in a measure, legally and illegally to more than decimate the magnificent denizens of the forests surrounding the city of Ottawa. The clearing away for agricultural purposes, and the destruction by bush fires of the forest in many places, has driven the deer back to more distant haunts. The wolf, too, although not more sanguinary in his instincts than the lawless crust-hunter, has done his part in thinning the deer in the valley of the Ottawa. Still, it is almost astonishing to know that there are large numbers of them on both sides of the Ottawa River, and in the forests bordering upon its many large tributaries. In summer the Virginian deer delights to hang around clearances for the purpose of feeding on grass, clover, turnips and potatoes. In former times many were killed from scaffolds in the nights by watchers in the turnip and potato fields. I have not time, nor do I wish if I had, to give a description of the various modes of deer hunting in fashion among sportsmen. As a sportsman I would scorn to refer in a descriptive manner to fire-hunting or crust-hunting. Of the two legitimate methods, still-hunting and hound-hunting, I prefer the latter, on the runway system, as less destructive and more lively and full of real sport than the former. To me with the glorious music of the dogs ringing and re-echoing through the woods, there is more sport in striking a buck on "the full jump" with a single bullet, than doing the same thing in any other style.

THE HORNS OF DEER.

No hunter to whom I have spoken, nor any book which I have read, has given me a satisfactory account of what becomes of all the cast-off horns of our common deer. I am aware of their being gnawed and eaten up by mice and other rodents; but during the period when the horns are falling, from the first to the sixth or seventh of January, it is a very rare occurrence even with little or no snow on the ground, to find the horn of a deer, and much more unusual to find both horns together. Some of the knowing ones say that the deer buries his horns; others say that he drops them in the water; but no proof has been adduced that either conjecture is correct. Although it is a common thing to find the shed antlers of the wapiti on the prairies, and around the borders of wooded slopes and along the banks of creeks, the whereabouts of the cast-off horns of the *Cervus virginianus* has not yet been discovered. This is a point in natural history upon which we still want light. It is a strange and mysterious provision in the economy of nature, that the periodical growth of a deer's horns—even the ponderous antlers of the moose or wapiti—should involve only an extraordinary forcing process of little more than four months. Shortly after the dropping of the horns, the new ones begin to appear. The growth is slow until the setting in of the warm spring weather, after which it is exceedingly rapid. The new horns make their first appearance in a round knobby, pulpy state. About the middle of August they are full grown, when they are covered with a soft, velvety skin, which the animal gets rid of by rubbing them against small trees. About the first of October, sometimes earlier in the season, the velvet has disappeared and the new antlers may be seen in all their hardness and beauty. The animal may be said to be then in his finest condition and at his heaviest weight. A buck of the *Cervus virginianus* is seldom seen on the first day of January with his horns on, and never that I am aware of after the fifth of the same month. It is a well known fact, however, that the moose does not lose his horns until later in the season. I have seen the head of a moose killed in January of the present year with the horns still on, and without any appearance indicating that they were about to fall off.

Here, I imagine, is the proper place to refer to some of the peculiarities and diversities in the horns of our common deer. It is difficult to account for the abnormal growth so frequently visible in the horns of those animals. Some naturalists seem to think that such irregularities of growth in the horns of deer have been occasioned by injuries received by the horn when in its soft and pulpy state. If such were the case, would it not be natural to conclude that after the deformed member had been shed, the new horn of the following year would resume its normal shape? This cannot be said to be the case. This head which I now show you, as you may observe, is one of most singular formation; and from personal observation I know that the splendid animal that carried this strangely abnormal pair of horns, wore his crown in its present shape year after year. I had a fair open view of this deer the year before he was killed, at or near the spot where he was shot, and I particularly remarked the strange-looking horn growing out of the right side of his head. Here are also two fine heads each with backward lateral prongs of a style which is rarely seen. Both have been taken from old and heavy deer. Abnormal shaped horns are seldom, perhaps never seen, except in deer of great size and age. I have frequently seen very old bucks of the red species with an immense long curved beam on each side, and others of similar size with only rudimentary protuberances, indicating, as it were, the places where in the horns of former years the prongs had been accustomed to grow. It is not always the largest buck that carries the largest horns. The largest deer I ever saw, and one that I gave the finishing touch to myself, had the most miserable set of attenuated antlers I have ever found on the head of a full-grown deer. On the other hand, one of the heaviest pairs of antlers which have yet come under my notice—I have them at home—were taken from the head of a deer of

about one hundred and fifty pounds in weight. Here is another set of red deer horns, perhaps the largest and most beautiful that any one present has ever seen. The animal from which they were taken was shot on the Castor, or Beaver River, fourteen miles from Ottawa. They belong to Mr. Harry Baldwin of this city. They are singularly regular in beauty of shape, and at the same time strangely irregular and unlike ordinary antlers of the *Cervus virginianus*. To a certain extent they are palmated and evidently grew upon the head of a very old deer. Perhaps some gentleman present may be able to enlighten us upon this question of abnormal horns.

In telling you what I have learned about the deer of the Ottawa Valley, I have aimed at the simply popular without aspiring at the purely scientific, as the mode more likely to interest the greater number. I have endeavored to avoid abstruse technicalities. Above all I have unwillingly been compelled to curb my inclination to tell the thrilling story of many a glorious run, and rehearse the tale of many a night of happiness around the camp-fire, where battles were fought over again, and memory brings around us the branching antlers of many a woodland monarch, whose trophied heads can be found to-day in more than one home of the dearly loved companions with whom I have so often pitched the tent in the wilderness. If I have succeeded in any measure in either instructing or interesting my audience this evening, I shall proudly feel that I have not roamed the woods, stood upon the runway, heard the deep and matchless music of the hounds, or drawn the rifle trigger in vain.

And now, my pleasant task is done,
The fruits of many a glorious run!
Still springing 'mid the lambent haze
Which circles round the camp-fire's blaze;
Revealing to fond memory's eye
The dear unrivalled joys gone by,
When limbs were lithe, and arms were strong,
And life one gladsome burst of song!
Revealing 'mid unfading sheen,
The runway in the forest green—
The antler'd monarch's springing bound—
The matchless music of the hound!
As headlong on the steaming scent
With instinct true as steel, he went!
The gaze into the spreading track—
The breaking twig, the rifle's crack,
The quivering limb, the closing eye—
The forest's dying majesty.

THE MUSKRAT AS A FISH-EATER.

BY C. HART MERRIAM, M.D.

THAT the muskrat is not commonly considered a fish-eater is evident from the absence of reference to such habit in the published accounts of the animal. Robert Kennicott is, so far as I have been able to ascertain, the only author who mentions this trait. He says: "Except in eating mollusks, and occasionally a dead fish, I am not aware that this species departs from a vegetable diet." ("Quadrupeds of Illinois Injurious and Beneficial to the Farmer," 1857, p. 106.).

At a meeting of the Biological Society of Washington, held in the National Museum, Dec. 14, 1883, Mr. Henry W. Elliott spoke of the "Appetite of the Muskrat." He stated that in certain parts of Ohio the muskrat did great injury to carp ponds, not only by perforating the banks and dams and thus letting off the water, but also by actually capturing and devouring the carp, which is a sluggish fish, often remaining motionless, half buried in the mud. In the discussion that followed, Dr. Mason Graham Ellzey said that from boyhood he had been familiar with the fact that the muskrat sometimes ate fish. In fact, he had seen muskrats in the act of devouring fish that had recently been caught and left upon the bank. The President, Dr. Charles A. White, narrated a similar experience.

On the 7th of February, 1884, I brought this subject to the notice of the Linnæan Society of New York, and asked if any of the members knew the muskrat to be a fish-eater. Dr. Edgar A. Mearns said that he had long been familiar with the fact, and that it was no uncommon thing to see a muskrat munching a dead fish upon the borders of the salt marshes along the Hudson. He has shot them while so engaged. He further stated that the muskrat is very destructive to nets, destroying the fishermen's fykes by scores by entering them in quest of fish and then tearing the nets in order to escape.

Dr. A. K. Fisher said that at Sing Sing, N. Y., he had often known muskrats to enter fykes, sometimes drowning, but oftener escaping by gnawing the meshes, thus doing considerable injury to the nets. He supposed they entered the nets because placed in their line of travel. He further stated that he knew that fykes made of fine wire were used with success in capturing these animals.

Mr. Wm. H. Dall, the well-known Alaskan explorer, now of the Coast Survey, kindly favors me with the following: "In 1863 I visited Kankakee, Ill., on a collecting tour for river mollusks, in July. You know how muskrats throw up mounds of the shells they dig out. I examined many of these for *Unios*, etc. On several I saw the skeletons of fish (chiefly suckers, I believe), partly or wholly denuded of their flesh, and showing the marks of muskrat (or, at least, rodent) teeth. I also saw the shell of a common mud turtle, so gnawed and in the same situation. I did not see the animal in the act of feasting, which, I believe, is chiefly done at night, but I have no doubt that the fish and turtle were eaten by the muskrat, as well as the mollusks associated with them in the same pile."

Under date of March 5, 1884, I have received from Dr. Fisher the most valuable record yet obtained concerning the habit in question. Dr. Fisher writes: "A few days since two young men were fishing through the ice for pickerel, with live bait, at Croton Lake, Westchester county, N. Y. Several times they were troubled by having one of the lines pulled violently off the bush and run out to its full length. Finally they saw the line start again, and by pulling it up quickly they landed a large muskrat on the ice." Here is an authentic instance, not of a muskrat eating a dead fish on the bank, but of actually capturing a live fish in the water under the ice. Fortunately the fish was attached to a hook and line, and the muskrat was caught and killed.

Cannot some of the readers of FOREST AND STREAM throw more light on this interesting subject?

The Rodentia being essentially an herbivorous order, with teeth adapted to gnawing, it is always very interesting to note any marked appetite for flesh among any of the species of this order. Many exceptions have been found to exist in regard to this general law, it having been long known to be a fact that rats will eat flesh as quickly as vegetables; that the capybara will eat flesh when no other food can be found, and that squirrels will at times eat animal tissues. In fact, it seems probable that all of the species of rodents may, under favorable circumstances, be caused to eat flesh. Now it has long been known to the writer, and it is probably well known to other observers, that the muskrat (*Fiber zibethicus*) will and does, at least in certain localities and under certain conditions, resort to a carnivorous diet. The piles of *Unios* heaped up on a muskrat's mound and the muskrat in the act of eating this mollusk have both been seen many times. Knowing this so well ourselves, and supposing it to be a well-known scientific fact, we never took the trouble to look it up, and hence were much surprised to hear it said in the Biological Society at Washington that it had never been published in any scientific monograph of the animal. At this meeting, Dec. 12, 1883, Mr. Henry W. Elliott, of the National Museum, read a paper upon the "Appetite of the Muskrat," in which he claimed to be the first to record the carnivorous habits of the muskrat before a scientific body, asserting that no published record could be found, in which statement he was sustained by the curator of mammals. The particular kind of eating which Mr. Elliott proved the muskrat to be guilty of never having been observed by the writer, and being of great importance and interest, are given below.

While Mr. Elliott was at his home in the West, several of his neighbors complained that they could get no carp from their ponds, and in his own ponds carp were seldom obtained. No reason could be given for their disappearance, as there should have been great numbers in the ponds. Hawks were not abundant, in fact the locality was rather too thickly settled for hawks to carry on their depredations. In several of the ponds obstructions were placed to prevent people from seining the carp, and through no possibility could they escape from the pond. But still they disappeared, and their disappearance still remained a mystery. At last he had the water drawn off and noticed two muskrat holes in the bank, but did not even then suspect the miscreants, until a neighbor came along and suggested that the muskrats were the depredators. Upon examining the holes few bones were found, a fact which could be explained by their cartilaginous structure rendering them digestible. The probabilities are then, and Mr. Elliott believes, that the carp were eaten by the muskrats, and unless some mode of exterminating the pests is found, he predicts that great damage will result to American carp culture. Being a sluggish fish the carp is easily caught, and furthermore, it has the stupid habit of sticking its nose into the mud and hibernating. So just in the season when the natural food of the muskrat is very hard to obtain, he has a luxurious fish, lying still in the water and easily captured. It is then easily understood how it would change its diet for a part of the year at least. Being a clumsy animal the muskrat could not obtain the quicker motioned fish. In the interesting discussion which followed the reading many new points were obtained, and it seemed to be a well-known fact that the muskrat would eat flesh, notwithstanding the fact that no published account of such habits could be found. One man said he had seen muskrats take bait from his line and eat fish caught by hooks. The way this animal gets the mollusks from the *Unio* shells without breaking the shells is not known, unless that they are allowed to die, and then picked out after the shell has gaped open. As to exterminating the muskrat, many suggestions were made. It being rather difficult to shoot them, it was suggested that steel traps be used. A gentleman said that he had frequently killed them by putting strychnine in an apple and placing the apple upon a stone. It is asserted by hunters that they cannot be killed with poison, but this person says that this is a mere prejudice. Certainly if it be a fact that the muskrat does eat carp he is a dangerous enemy, and should be vigorously persecuted by any and all means.

WASHINGTON, D. C. R. S. T.

BIRD NOTES.

THE spring flight of ducks to the north has commenced. I saw six wild geese yesterday, the first this season. Black ducks, shelldrakes, whistlers, oldwys, broadbills and coots are about the only species that are found around here. They are coming on in quite large numbers. I very seldom see wild geese flying this way to the south in the fall, but generally see them in large numbers in the spring in their flight to the north, which generally commences about the last of March, with them and ducks, and lasts until about the first of May, when they disappear altogether. I was out shooting to-day and killed an uncommon large sea gull called gannet, a species very seldom seen around here unless it is a very cold winter, like this winter. The feathers on the breast and neck are pure white, while those on the back and wings are jet black. F. I. C.

NORWALK ISLAND LIGHTHOUSE, March 14.

Within the last week numbers of bluebirds and robins have made their appearance; and yesterday I saw a flock of Canada geese flying northwest. If the weather continues as mild and pleasant as it is now, I expect to note many more arrivals. NEMO (of Texas).

FRANKLIN, Mass., March 19.

The following may be of interest to ornithologists: Mr. C. M. Carpenter, of Providence, reports seeing white-breasted swallows flying March 12, and March 19 redwing and crow blackbirds. This is a very early date for the arrival of swallows with us. SAMUEL F. DEXTER.

PAWTUCKET, R. I., March 22.

THE PLUMAGE OF QUAIL.—*Editor Forest and Stream:* In January I had from Southern Tennessee a dozen live quail bred in that country, and recently I have obtained a few live birds which are native to Northern Ohio. The plumage of the former seems to me (without having the two specimens side by side) to be much brighter, and the markings much more distinct than those of the Ohio birds. Does the difference exist only in my imagination; is it because all birds of the family are in finer feather in January than in March; or is there an actual difference of plumage in the different latitudes? Will some expert give the facts?—B. (Toledo, Ohio, March 20). [The Southern quail have the plumage somewhat brighter and the markings more sharply defined. In the Southwest (Texas), on the other hand, the plumage is grayer and the colors blend more. The dark Cuban race of *Ortyx virginianus* and the Texan form are the two extremes. It is hardly probable, however, that you would find any very strongly marked differences between birds from the localities which you mention.]

Game Bag and Gun.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

In looking over the long list of rifles now in the market to see what one would choose as a hunting rifle, one is forced to admit that, although there are many rifles of various patterns, there are but few that fill the bill as one would like to have it. Let us begin at the beginning and examine some of the best, or those that are recognized as such, leaving the confessedly inferior guns out of the account.

In singleloaders we have first of small caliber the .22 Ballard and Stroms, differing but little from each other in shooting qualities, and the difference in mechanism being mainly a question of taste, as both are strong enough and safe enough for the light cartridges in use. But when we examine the proportions of powder and lead of the cartridge we find for the .22 short 3 grains powder and 30 grains lead, or 1 to 10; for the .22 long 5 grains powder and 30 grains lead, or 1 to 6, and the .22 extra long 7 grains powder and 40 grains lead, or 1 to 5.7, a proportion that in all cases seems to me to be enormous, as more powder (with increased velocity and dangerous space) could just as well be used as not, provided the bullets were made hard enough to stand the heavier blow of the powder, so as not to be too much upset in the barrel.

Doubtless for gallery or target practice the cartridges are heavy enough, as generally the gallery is of but short length, and the distance shot at invariable; so that the gun once sighted, good shooting follows. But cannot this gun be improved and its usefulness extended by increasing the weight of powder? Are there not many who could and would use this rifle as a "squirrel gun," provided it held its flight long enough, and had a flat enough trajectory to be depended upon for shooting at variable distances? Although from experience I know it shoots hard enough to kill at say 75 to 100 yards on small game, still the curve of the trajectory is considerable, and could be lessened by the use of more powder, and a more effective gun be the result. There is nothing in the mechanism of either rifle to preclude the use of a long cartridge, as in both the chamber is open at the rear when the gun is opened, and any length can be inserted or extracted.

The form of the bullets of this caliber could also be improved, and the manner of their insertion into the shell made the same as for heavier cartridges, and improved shooting be the result; the bullet being made full .22-caliber for the entire length of its cylindrical part, and the contraction where they enter the shell being done away with. This would give a bearing surface for the ball of the full length of the cylindrical part, as well as abolishing the "neck" at the rear of the bullet that may have a tendency to derange its flight.

Passing to the next higher calibers we have Ballard, Stroms, and Remington .32-caliber singleloaders, Winchester .32-caliber repeater, and Smith & Wesson's .32-caliber revolving rifle; the Ballard and Stroms using .32 short or long cartridges, either rim or central fire, the Remington possibly the same, and the Winchester and Stroms center fire cartridges.

In the rim fire .32-cartridges we have powder 6, lead 55 for the extra short; powder 9, lead 82 for the short; powder 13, lead 90 for the long; powder 20, lead 90 for the extra long; and in the center fire cartridges powder 9, lead 85 for the .32 S. & W.; powder 12, lead 90 for the .32 Colt's; powder 9, lead 82 for .32 short; powder 13, lead 90 for the long; powder 20, lead 105 for the extra long, and powder 20, lead 115 for the .32 Winchester.

An examination of this list shows a proportion of powder to lead of from 1 to 9⅙ to 1 to 4⅓ for the rim fire, and 1 to 9⅔ to 1 to 5¼ for the center fire, a proportion altogether too small for the powder in my opinion, and easily remedied for the Ballard, Stroms or Remington, as they all can take a longer cartridge without alteration, whereas the Winchester, and Smith & Wesson's would probably need alteration to accommodate the longer shells.

In the .38-calibers, also found in the Ballard, Stroms and Remington for singleloaders, and in the Winchester and Ballard for magazine guns, we still have either rim or center fire cartridges for the singleloaders, and center fire for the magazine guns, and a proportion of lead to powder of from 7 to 1 to 4 to 1, approximately for the singleloaders 4½ to 1 for the Winchester or Bullard, and 6 to 1 for the Bullard special, and it is only when we come to the .40-calibers that we begin to reach heavy charges of powder as compared to the lead, as well as guns in which new cartridges have been adapted, preserving their length invariably so as always to place the bullet up close to the grooves, but yet varying the proportions of powder and lead.

In the .40-caliber we have the Ballard, Sharps, and Remington as singleloaders, with the Bullard and Marlin as repeaters. The singleloaders using central fire ammunition, have a proportion of powder to lead of from 1 to 5⅞ to 1 to 4½, the .40-90 Sharps using the heaviest cartridge, 90 powder, 370 lead, while the Marlin uses the 60-260 cartridge, leaving the Bullard as the only magazine rifle that uses variable cartridges or that excels the old Sharps with its 90-370 charge.

In the Bullard .40-caliber we find two guns, one using the straight shell with 60 grains powder and 260 lead, or their special cartridge with 75 grains powder and 225 grains lead, a proportion of 1 to 3, or another gun using at present 90 to 95 grains powder and 300 lead, so that in either gun a more powerful magazine gun than any yet introduced will be found; and one has only to pay their money and take their choice between either the .40-60 or .40-75 straight-shelled gun, or the .40-90 using the bottle-necked shell.

Passing by all the .44 calibers as "among the things that were" (for what is the use of a .44-caliber when the .45 comes so near to it, and all later guns are of this caliber), and particularly as all the magazine guns of this type have too little powder to their lead, we come to the .45 caliber, and here we still find the Ballard, Sharps and Remington, the Peabody and Springfield also appearing, for singleloaders, and the Bullard, Winchester, Marlin, Kennedy-Burgess, Hotchkiss, Lee, and a host of others for magazine guns, and nearly all of the latter with a disproportion of lead to powder, they having mainly been, in caliber, copied from and adapted to use the same cartridge as the Springfield, a military and not a hunting rifle.

By this I mean that the government having adopted .45 as the caliber for its rifle, manufacturers followed in adopting the same caliber, and adapted the government cartridge for their guns in competing with the Springfield before ordnance boards; and having adopted this caliber and cartridge, and laid down the "plant" to make them, still adhere

to this standard for their rifles, although they do not come properly under the head of hunting rifles.

It is true that there are singleloaders and one magazine gun that do not come under the above head; but still from the ammunition the singleloaders use they are all properly long-range rifles, and not properly short-range hunting guns. The one magazine rifle, although adapted to the government cartridge, has still another special one, and with this in use comes under the proper class of hunting rifles.

Understand that I do not mean to say but that these rifles may all be used as hunting rifles, and game killed with them; but I do mean to say that the hunter using them has got to be not only a good hunter but a good judge of distance, or he will miss more shots than he hits from shooting over or under from the high curve of the trajectory at short range—a fault not to be overcome in a rifle intended for long ranges except by the adoption of some special ammunition, with more powder and less lead for the short ranges.

Such being the case, the introduction of the 85-285 cartridge by the Bullard Arms Company is to be welcomed by all who have .45-caliber rifles chambered for the .45-70-405 cartridge, for it gives them a hunting rifle as well as one of long range, and one that has power to kill at all reasonable distances with the light ball, as well as one for long shots with its regular cartridge. And on the frontier, where .45-70-405 is the standard cartridge, from the very fact of its being the government standard, ammunition can always be had, even when the special ammunition gives out, as it may on a long march, scout or expedition, and the rifle still be effective.

A recent change in the government standard to .45-70-500 is fast running out the .45-70-405 cartridge at military posts, and therefore still more should the .45-85-285 cartridge be welcome, as the new government cartridge is still more emphatically a long-range cartridge than the old one, and the special cartridge therefore more needed. A very mistaken impression seems to prevail that the Winchester .45-caliber can be used with the government shell, or use the .45-70-405 cartridge, and in fact, if I remember aright, I have seen it so advertised by dealers, but not by the Winchester Arms Company, to do the latter justice; the Winchester .45 does not use the government cartridge of any kind, but uses either the .45-60-300 cartridge with straight shell or the .45-75-350 grain cartridge with bottle-necked shell, so this makes two guns of the .45 class of their make.

I have tried to adopt the .45-70-405 cartridge to the Winchester, but found it impossible, as the length of the "carrier block" is not enough to take in the length of this cartridge. Neither will it take the .45-55-405 government carbine cartridge, as this is the same length as the .45-70-405, the space in the shell not filled by powder being filled with pasteboard wads.

The Marlin .45 uses the government cartridge .45-70-405, the Kennedy uses the .45-60-300 cartridge, the Burgess did use the .45-70-405 cartridge, but appears to have passed either out of date or under another name, the Hotchkiss and Lee both use the .45-70-405 cartridge, and are of the bolt type of repeater, working with the knob on the side, and not with the lever.

Passing to the .50-caliber, we still have singleloaders, but all using a proportion of lead to powder of 1 to 8 to 1 to 5, and then for all properly long-range rifles, and in magazine rifles we have the Bullard and Winchester express—both using the same cartridge.—50-95-300—and both good guns, the only .50-caliber magazine rifles I know of; the old-fashioned Spencer being .56-caliber and about obsolete.

From an examination of this list of rifles it cannot but be seen that, with the exceptions noted, all are undercharged with powder and have a high trajectory; the ball starting with a slow velocity; the trajectory must have a high curve to get the ball to the distance desired, and the ball having considerable weight, and therefore the remaining velocities not diminishing very rapidly, the ranges will be long, a thing good in itself for some purposes, but not what is wanted in a hunting gun.

In considering this list of guns, no account has been taken of any special home made ammunition, but only of the factory or standard and special ammunition made by the manufacturers for the trade; doubtless there are many who have already altered the proportions of their powder and lead improvement of the shooting of their rifles.

No mention has been of special guns such as can be had by paying for them; but I have confined myself to those guns found advertised as made for the trade, that any one can find by looking for them. That there are such special guns I am well aware, and can only congratulate those that are able to possess them.

As said by me in a previous letter, it is a pity that more qualifications cannot be combined in one gun; but, as that is an impossibility, one has to "pay their money and take their choice" from what are to be had, unless able to have a special gun built.

In the singleloaders I would choose a gun whose mechanism was such that I could see through the barrel from the rear end, whose breech block was at right angles to, or locked itself firmly against the breech, and then I would have a gun I could vary to suit myself, provided I could find a mechanic with skill enough to chamber it as I wanted for longer cartridges; but in magazine guns one cannot do this, there are other elements that enter the problem, and the breech frame being a fixture, longer cartridges cannot be fed into it from the magazine than the breech frame and carrier were built for; now the gun should be chambered to receive them; with such chambering done the gun could be used as a singleloader with such special long cartridges, provided there was room enough to extract the shells, and as a magazine gun with its regular ammunition, the shooting qualities with the regular ammunition being somewhat impaired, however, from the chamber being deepened.

For magazine guns, therefore, the only hope of perfect results is to be found in an appeal to the makers either of the guns or the cartridges; to the gunmakers, if the size of the parts have to be altered to suit longer cartridges, and to the cartridge makers if more powder and less lead can be obtained in the same length cartridges, so as not to have to alter the dimensions of the gun.

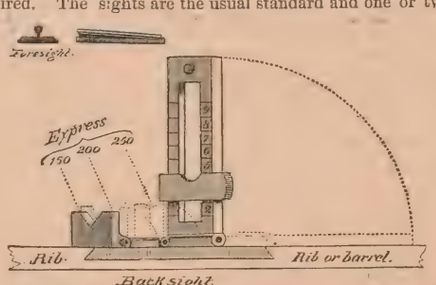
That such appeals are not in vain, the production of the .40-90 and the .45-85-285 cartridge will show; the .40-90 being an alteration of these makers' .40-60 to take this special cartridge, and the .45-85-285 being a new cartridge adapted by them to their .45-70-405 rifle. Doubtless other appeals to other makers would be followed by more powder and less lead in their rifles, an end so much to be desired, in my opinion, as I have tried to set forth.

But we now have three powerful guns before us, or I may say four—the Bullard with its .40-75-225 cartridge, the same with the .40-90-300, the .45-85-285, which will also use the .45-70-405, and the .50-95-300 express of either Bullard or Winchester make, and unless one wants a special gun, it seems to me there is not much more to be wished for.

A great deal has been said about the killing power of the .40 bullet as against the .45, and all against the .40 on account of its smaller area. That it will have less killing power on account of its diminished area is conceded, but not to the extent that is claimed by some. The areas being proportioned to the square of the diameters, these areas will be in the proportion of $.200^2$ to $.225^2$, or 40,000 to 50,625, or the area of the .40-caliber bullet will be a little less than four-fifths of the .45-caliber.

But other factors enter into the "killing power" besides area of striking surface. The "living force" of the bullet, depending upon the mass and the square of the velocity, comes in also; and, as the velocity has the element of the resistance of the air to contend with, more velocity can be given to the .40 than to the .45-caliber bullet with an expenditure of equal force, and the .40-caliber bullet will therefore have more "living force" provided its mass is the same as that of the .45-caliber.

Take the .40-90 as compared with the .50-95, both Bullard; both bullets weigh 300 grains, and the extra amount of powder behind the .50-caliber, will not much more than overcome the increased atmospheric resistance that it has to overcome from its increased area of cross section; so that, leaving the express principle out of account, the .40-90 would probably have the greater living force, and the greater penetration also, as the penetration would be inversely as the striking surface, other things being equal.



Whether more powder behind a .50-caliber bullet is to be desired I leave for some one else to solve. Doubtless for heavy game such would be very desirable, but then we would have a special gun only fit for the large classes of game and one that would be useless on the smaller kinds.

Though arguing that one all-around gun is as impossible as one all-around boat, or as impracticable as the general run of "general utility tools," still I claim for the .40-90-300 magazine gun a greater range of usefulness than for any gun that has yet been made; next to it probably comes the .40-75-225; next the .40-60-260, for all those guns can be used on a wide range of game, while the .45-85-285 and the .50-95-300 are more to be considered as special guns, useful and powerful in their place, but not to be chosen for general work. C. D.

FORT MCKINNEY, Wyoming, March 1, 1884.

Editor Forest and Stream:

It is, as most sportsmen are aware, possible to combine the advantages of a long range and express rifle in one weapon. This is very successfully done in a rifle which is made here principally for South Africa, by Messrs. Henry, Turner, Tolly, and others. It is a .45-caliber, with 28-inch barrel, and of about 8 or 9 pounds weight, taking the usual musket shell and 80 to 90 grains of powder, and has a spiral of one turn in 22 inches, the usual military rifle twist. It shoots both express 270-grain hollow and 480-grain solid bullets well, and the same cartridge can be used with either bullet as occasion requires. If the shells are loaded with powder and wad only, either kind of bullet can be inserted as required. The sights are the usual standard and one or two

leaves for 150, 200 and 250 yards for the express bullet, and a long leaf with slide graduated from 200 to 800 or 900 yards for the long-range bullet. Either sight can be used independently of the other, and they do not interfere with each other; the standard sight of course is used for short ranges with the heavy bullet. The express sights are placed in rear of the long-range one, and as the latter lies flush with the rib or barrel of the rifle when not in use, it is not in the way. For Indian shooting, rifles are hardly ever sighted to over 250 yards, as it is generally considered unsportsmanlike to try long shots, and they are rarely attempted except by novices, or on very special occasions. The rough sketch will give an idea of the sight. BENGAL SEPOY.

LONDON, Eng.

Editor Forest and Stream:

May I rise to explain? I will. In your issue of March 13, "D. M. B." alludes to me; and although the allusion is complimentary, flattering even, it will be apt to give a wrong impression of at least one old swamp loafer of the seventh distillation.

He says: "Every true sportsman must admire the picture of our old friend 'Nessmuk,' clinging with fond tenacity to the use of the old muzzleloader that has served him so long and well."

It is true. In my declining years I have gone back to my first love—the single-barreled, hair-triggered, muzzleloader, and it has served me "long and well." But do not infer that I have clung with blind prejudice to any such weapon throughout my best days in the woods. Very far from it. On the contrary, I was among the first to take up and test the breechloader from its first advent. I started in with a Sharps carbine. I got it in Rochester, and I thought it about as sportsmanlike a weapon as an ordinary spade. There was no hang, handle or nicety about it. They talked about "balance." A crowbar will balance—if you take it at the middle. Estimating the graded sights, I concluded the makers had allowed for 100 feet drop in 100 rods, which turned out to be the case. Only, it wouldn't drop two successive bullets within ten feet of each other. With my muzzleloading Billinghurst I could hit a 30-inch ring all day at that distance.

I traded the Sharps to a fellow who was going to Kansas, and my next venture was a Maynard. This was more like a rifle, but there were insuperable objections to it. The barrel was too short, the sights too near each other, the back sight "blurred" in dark woods, and it needed a donkey with a short-tug harness to pull it off. I took it to a gun shop, had these faults remedied as far as possible, loaned my faithful old double barrel to a friend, and adopted the Maynard for the season. The first two days I hunted with it I lost three deer that I would have been dead sure of with the double barrel. At the end of the season, on a fair estimate, I had lost one-half of the deer I ought to have scored. I did not care for the loss. They were welcome to go. It was the vexation and disappointment. I sent the Maynard out West, and tried a Ballard, then a Spencer, and eventually a business Sharps and a Winchester; also a Remington. Now, I will admit that the last three named are wicked, murderous weapons. For the plainsman and the mountain hunter, the business Sharps is sufficiently destructive, while for black bear and deer in a wooded country, the improved Winchester ought to satisfy the most greedy maker of "bags" and "scores." But it doesn't. Not a number of FOREST AND STREAM comes to hand in which I do not find well-written articles on the best, *i. e.*, the most destructive, hunting rifle. The diverse notions advanced are a trifle amusing. One wants a .40-90-500 repeater; "D. M. B." wants a .45-115 to 120-350 cartridge, while "Manhattan" finds 25 grains of powder in the Winchester "heavy enough for moose, caribou and bear." The fun of it is, to a simple backwoodsman, that these articles are written by the very sportsmen who are most eager for efficient game laws and the enforcement thereof—the men who most bitterly deplore the rapidity with which our best game is being slaughtered.

Gentlemen, you are right. Demand creates supply. Keep up the demand for a "perfect hunting rifle"—one that, while not too big for a squirrel, will stop a 1,200-pound grizzly in his rabid charge, and with a "trajectory" so flat that it will not be at all necessary to make any allowance on sights from forty yards to four hundred. The rapid increase of panthers, grizzlies and other "dangerous" animals demand that the coming rifle shall possess the ultimate possibilities of slaughter. Let us have the perfect rifle by all means.

NESSMUK.

WELLSBORO, Pa., March 17.

The rifle columns of your journal have for some weeks past contained a series of most interesting papers relative to the choice of a hunting rifle, and while the majority advance the merits of existing calibers, but a few have advocated a change in proportions of powder to lead, and only one an innovation, a .28-caliber. This correspondent, "Peabody Martini," after a series of experiments, has determined that for all small game the .28 is superior to the .32 or .38. This is indeed a long step in advance, and present calibers with ammunition as now furnished must yield to the coming rifle for all game smaller than deer. In behalf of the large number of rifle enthusiasts, whose leisure is too limited to permit a lengthy trip, and who, in the suburbs of cities, can enjoy a few hours sport with small calibers, allow me to appeal to manufacturers concerning the popular .22-caliber. The ammunition as now supplied is most unsatisfactory, if very cheap, and a great deal more pleasure could be had if the powder charge was increased, the ball hardened, and made to fit a central fire, bottle shell containing fifteen grains powder or more, the balls swaged. The long .22 now contains but 7 grains, and the shorter ones from 3 to 5 grains. With present ammunition the gallery ranges are from 30 to 50 feet, and even then a full score is the exception because of the faulty method of making the balls of a less diameter that part of their length which is sealed in the shells. Were they seated as they should be and hardened, and an increased powder charge in a larger shell, bottle-shaped, the accuracy would be much improved, and the interest in that sport much greater. In my opinion the English sparrow is the legitimate target for this caliber where game is unknown, if they are half as much a nuisance elsewhere as in New Orleans.

G. H., M.D.

NEW ORLEANS, March 20, 1884.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I have read with interest the various opinions by different writers in your journal on the subject of guns. I will give you mine for what it is worth. I commenced to shoot long before breechloading shotguns were known, and was very well content with the old muzzleloader, having owned two excellent ones before the war, and came into possession of a very superior one just after the war. I shall never forget the contempt with which I viewed the first breechloader I saw—about fifteen years ago. The next time I saw one was an altered Greener, of which I will speak hereafter. From year to year I became more familiar with them, and finally bought one of an American manufacture, and still shoot it at birds. After careful experiment and observation in the field, I became satisfied that, for bird shooting, they were quite as good as the muzzleloaders, while the superior convenience and safety of them was too apparent to question. I for a long time doubted, however, their capacity to cope with the muzzleloader in buckshot shooting; but am now satisfied on that point. My first experience with them in buckshot caused me to condemn them, utterly. I had hunted deer for many years—killed a good many—and had never missed a single deer up to the time of the trial I made with the breechloader. The first three deer I shot at with my breechloader I missed, and they were all within easy range. I laid it aside and went back to the muzzleloader—a 10-pound, 10-bore Greener—and every one I shot at I killed until the fourth. This one I made a clean miss on, and so with the fifth. The next time I went deer hunting I took the Greener before mentioned that had been altered from a muzzle to a breechloader. I killed four deer straight with it, all at good fair distances. I then began to think that there was more in the man than in the gun. So I took my discarded breechloader and tried it with both the muzzleloading and breechloading Greeners—both of which I knew to be good buck guns—and found that it made as good a target as either of them. I have not tried it on deer since the target practice, but last fall I went with a party of gentlemen, most of whom had breechloaders, some muzzleloaders. We made an extra fine hunt, and the number of misses turned out fewer on the breechloader side than on the muzzleloader. I scored a clean miss with my muzzleloader. After the hunt we did some target practice, and the breechloaders showed up superior. I am now fully persuaded that the breechloader is the equal of the muzzleloader in all kinds of shooting, and that it is pure prejudice in any man who holds up for the superiority of the latter over the former in any kind of shooting. I had it (the prejudice) as bad as a man could have it. I first divested myself of it by actual experiment in bird shooting, but clung to it for some time on the buckshot. Now I am convinced that there is not the slightest appreciable difference in that. I feel sure that the trouble arose in my case—and, no doubt, this is what is the matter in other cases—from overloading the breechloader. Too

much powder. Twelve buckshot, that a No. 12 paper shell will chamber four of, only weigh an ounce, and hardly that unless they fit too tight. So that why should one put a great load of powder (4 to 5 drams) behind an ounce of buckshot, and only 3 to 3½ drams behind 1⅛ and 1¼ ounces of bird shot?

WHACK.

STAUNTON, Va., March 18.

Editor Forest and Stream:

In your issue of Feb. 7, "Buckeye" asks: "How much further will a 10-gauge kill its game than a 12, both guns of same grade, and bored on same principle?"

Under ordinary circumstances, I say, not an inch. The greater number of shots are at single birds; and a 12 choke-bore charged with 3 drams of good powder and 1¼ ounces of chilled shot, No. 4, 5, 6, 7 or 8, will kill a single bird, sitting or flying, duck, quail, prairie chicken, snipe or woodcock, or with No. 1 or BB a goose, just as far as a No. 10 will, charged with 5 drams of powder and 1¼ ounces of shot. For close, strong, hard shooting, and long range, the 12 gun need not be more than 28 inches long, not heavier than 7½ pounds, while the 10 would require to be 30, 32 or 34 inches long, and 9 or 10½ pounds in weight, necessitating a waste of strength to carry it about, and an unnecessary waste of ammunition—a nuisance to carry—in its use. I have given the weight and length of my own full-choke hammerless Greener above, the shooting and killing qualities of which are at least equal to the better class of choked guns. At from 20 yards up to 80 yards, I find my gun, when carefully and properly loaded, always equal to the occasion, and its execution singularly free from accidental or wild shots. Speaking from my own experience, I would just as soon think of firing a field piece loaded with grape or canister at a wild turkey, as to discharge 4½ or 5 drams of powder and 6½ ounces of shot at a single bird of any of the varieties enumerated above, excepting, perhaps, the wild goose. If I want to shoot at a flock of ducks at 100 yards, I can always manage to reach them effectively with No. 1 or No. 3 shot. Further still, if you tie the 10-bore down to 3 drams of powder and 1¼ ounces of shot, in competition with the 12 at long range, the former will be simply nowhere. Lightness, combined with necessary solidity and safety, and a minimum of charge, sufficient to lessen expense, and moderate recoil, yet completely effective, are among the chief characteristics of a good gun. All these desiderata can be found in a first-class No. 12 of at the outside 8 pounds in weight. Too much of a good thing is sometimes objectionable. For the information of our friend "Buckeye," who, perhaps, may not have taken the trouble to experiment backward, I wish to say that I have done some capital shooting with my gun with 2 drams of powder and half an ounce of Tatham's American chilled No. 6 shot, up to 45 and 50 yards; but, as a matter of course, at birds on the wing, the calculation and precision would require to be drawn to an extreme nicety. For flying shooting I cannot recommend such small charges. "In the multitude of counsellors there is safety." I need scarcely say that I am in favor of the hammerless gun, in my opinion the *ne plus ultra* of breechloaders. ALGONQUIN.

OTTAWA, Canada, March 10.

Editor Forest and Stream:

I have used shotguns ever since I was big enough to be trusted with one, and have owned several, but when I got my first double barrel, the climax was reached in my estimation. This was a 14-gauge 34-inch barrels, and was really a good shooting gun. To prove this, I was once barred in a shooting match in company with a friend whose gun was same size bore as mine, with 32-inch barrel. After each of us had got a chicken, we were not allowed to shoot any more. The conditions were to put two shot in a 6-inch circle at 80 yards. Two years ago I got the fever for a breechloader, and so sold my old favorite, the muzzleloader, and purchased a breechloader with all improvements, a W. Richards .12-28-8⅝. I immediately commenced to experiment with my new gun, and in a short time I found that my old gun was nowhere, as the breechloader would discount it in distance, penetration and distribution. I once shot against two 10-gauge guns, breechloaders, distance respectively 60, 80 and 100 yards, two shots each at each distance, and my score was the best every time, which proves conclusively, to my mind, that the 12-gauge is superior to the 10 for all ordinary shooting. I use the Winchester brass shell, and for woodcock, partridge, etc., I use 3 drams American Dead Shot powder, one wad on same (Winchester pink edge) 1¼ ounces Tatham's chilled, No. 8 shot, with thin black-edge wad on same. For squirrel shooting the same quantities, only No. 6 shot.

I have experimented a great deal in loading, and I find that the above method gives the best results. If any one will use the same quantity of shot that they do of powder (in bulk) for brush shooting, I think that they will agree with me. I know that a great many use two wads on the powder and claim better results, but I claim that one good thick wad that will not blow to pieces in the barrel is better than more. If two wads are better than one, why would not three be better than two, and so on. I would like to hear the experience of others on this point, especially those who have experimented the most, and if two wads are better than one, please give the reason why. WESTLEY.

NEW MARKET, N. H., March 17.

Editor Forest and Stream:

I have an 8-pound Parker gun, 12-gauge, 28-inch barrels. I loaded four metal shells for target practice on Saturday, 15th, as follows: 3¼ drams of Hazard's No. 5 ducking powder, and 1⅛ ounces of shot. I placed two No. 10 pink-edge wads with a Barclay loader firmly on powder, and one of the same thickness on the shot. At a target 40 yards distant and 30-inch circle I obtained the following result with very even distribution; First shot I placed inside of the circle 200, second 219, third 225, fourth 227. AMATEUR.

COLLINSVILLE, Conn., March 17.

Editor Forest and Stream:

As how to load is the leading topic, I will contribute my mite: For a Baker 12-gauge, three-barrel, 9 pounds 6 ounces; for birds, 3¼ drams powder, 1 ounce No. 8 shot; for squirrels, 3¼ drams powder, 1 ounce No. 5 shot; for ducks, 4 drams, 1 ounce No. 5 shot; for geese, 4 drams, 1 ounce No. 1 shot; two pink-edge wads on powder; one thin cardboard wad on shot; No. 4 Hazard duck-shooting powder. I find I can stop anything within 70 yards, but over that distance there is no certainty about it. I have made some very long shots with this gun, but do not rely on such shots to fill the bag. I would like some one who uses the three-barrel gun to tell me what kind of a back sight he uses, as the one the factory puts on the gun I cannot do anything with. I can do better shooting without raising the back sight; have killed squirrels, ducks and geese at 40, 50 and 70 yards without raising the back sight, but over that distance cannot do anything with the gun with or without raising the sight. TINKER.

DECATUR, Ala., March 18.

[NOTE.—The communication of "D. H. S.," in our issue of March 6, in which it was stated that his gun put No. 3 shot in an inch circle, has been criticised by a number of correspondents. It is due to "D. H. S." to state that he wrote "No. 8 shot," and not "No. 3" as printed, and that the blunder was made by the printer, the writer of the note being in no way responsible for it.]

COMING OF THE BIRDS.

THE wildfowl are back with us again, at least their vanguard has been sighted. I saw a pretty pair of green-winged teal and a black duck in the market a few days ago; they had been shot in Greece by James Burns, one of the numerous farmers living in the town who are good shots and shoot a great many ducks every season.

This morning I was aroused from slumber by a sound that seemed familiar, although I had not heard it before for several months. It came from overhead, and on looking out of the window my conjecture was confirmed, for there, in full view, a few hundred yards above, was a flock of about thirty Canada geese, beating the air with slow pinions and gobbling in their usual noisy fashion—noisy, I said, but it was more musical to my ear than sounds I have often paid to hear. CROWN WAD.

ROCHESTER, N. Y., March 22.

Ducks and geese commenced coming in from the south on the 26th. The main spring flight is not here yet. Ice is all out. Sportsmen who want to hunt on the line of the Atchison, Topeka & Santa Fe R. R. for ducks or geese, are advised to stop off between Nickerson and Larned. Further west is no good, for we raise but little grain west of Larned and there are twenty ducks east of there to one west.

W. J. D.

CIMARRON, Kansas, Feb. 28.

Woodcock and snipe have arrived. There was a woodcock killed about ten days ago, and one last night at the Relay House, by flying against the telegraph wires; attracted by the electric light, I think. The one this morning was fat.

H. B. VONDERSMITH.

LANCASTER, Pa., March 22.

TWO MORNINGS' WORK.

ONE evening in January, 1884, as I stepped from the ferryboat at Sullivan's Isle, a little girl met me with, "O! Mr. G., you ought to have been here to-day. Mr. Hudson shot twenty-two ducks and Mr. Edwards twenty-five." A minute later, as I stepped into the door of my house, my wife saluted me with, "O! John, you don't know how many ducks have been shot to-day! Mr. Hudson killed twenty-two and Mr. Edwards twenty-five. They have been shooting all day. Clarence went out, but he only got eight." By and by in came Clarence, a young friend without much experience in shooting. He told me that the cold storm had driven the ducks in the cove. "But why did you not kill more than eight if there were so many?" "Well, you see, John, the canoe rolled so that sometimes I shot within four feet of the boat, and then I did not know they were there until Hudson came back." "Didn't you hear them shoot?" "You see, I was busy, and did not pay any attention to it." "Shot fifty cartridges and got eight ducks!" "Yes, but I crippled about twenty, and they were wild after being shot at so much."

I determined to see if I could bag a few of them the next morning. First, my decoys were packed nicely in a basket. The canoe is moored at the steps; the 10-bore looked at, and found in good condition. Next come the cartridges, which are carefully emptied on the floor. Not very carefully you think? Well, no; but you see if you empty them on the table, they will roll on the floor; and then I enjoy sitting on the floor and counting them. At length forty-five shells, mostly loaded with No. 5 shot, are all I can find. These are carefully put in the boat-box; next my clothes are placed where I can find them; the alarm clock set for 5 o'clock, and I sleep to dream of ducks. Once in the night I awoke and was sorry to hear it was raining. At 5 o'clock still raining and the wind blowing a gale. However, I started for the wharf, but, just as I reached the shed, down comes the rain in torrents, and the wind blew so that it shook the shed like a leaf. The weather is really too bad, so I go back to wait until the wind goes down. Although it is only seventy-five yards away, as I am coming back I am caught in a shower and drenched up to my knees.

But what is that? Yes, a duck flew around the wharf and lit not thirty yards away. Two cartridges are quickly slipped into old Pieper, and I sight across the barrel, but I can't see the duck. There he is, but the rain comes fast and it is not quite light. I see him at last and give him the open barrel, and there he is with his heels up. In another minute I have him—a little fellow, but plump. I now finish bailing out the canoe, get everything aboard, and start across the cove. Several flocks of ducks go up wild, and as I near the marsh a black duck gets up, but out of shot. I now put out the decoys, pull the little boat in the marsh out of sight, and wait and watch, but not a duck will come near. It is getting very cold. This won't do. I will row across the cove and see what is over there. As I round a point three little fellows rise. I stop two with the first barrel, and the other with the next; but two of them are only crippled and have to be shot over. A little further on I see a large flock, just around a point of marsh, and as I get within a hundred and fifty yards of them down comes a colored brother with an old musket, and as I hear it thunder away go the ducks. He did not kill one. Just as I am in the act of thinking what a jewel he is, the ducks circle and come right past me. They are a long way off, but I give them both barrels for luck, and nine fall, but several have to be shot over. I now get to windward of the birds and the little eggshell goes down on them like a flash, and it is now blowing a stiff breeze, the little fellows have to rise to the windward. I empty both barrels among them.

So I followed them up. Every few minutes there would come a shower, and several times I had to stop and bail out the canoe. My rubber coat I had long since thrown into the bottom of the boat to kneel on. And what would I have done without my boat box? It kept my cartridges dry as a chip. After a little more of this I am tired, hungry and wet through and through, so I start for home. A few strokes bring me to the wharf. I have not been a half a mile from home all the morning. The ducks are soon counted and number thirty-one. After donning dry clothing comes a good breakfast, and who relishes his meals like the hunter? The gun is cleaned up nicely, and I take 12 o'clock boat for town. In the evening I bring seventy-five cartridges loaded with No. 7 shot. The next morning, wind blowing half a gale and very cold. By keeping well in the lee of the shore and up the creeks, although ice made in the boat, the spray wet me up some. After three hours' hard work I brought in thirty ducks. As I came in I had killed a beautiful drake that I thought I would have set up. A crowd from the saloon met me with "What luck?" Not one of them went out; too cold that morning. I had my gun in one hand, the drake in the other. I laid it on the sidewalk, and with a tired look, which was not very hard for me to assume, for I was very tired, I pointed to the lone duck. "One duck," said one. "Hard luck," said another. "After all that hard rowing," put in the third. Then they commenced to brag and tell how many they had killed the first day, and I told them I had twenty-nine more in the boat. "Twenty-nine in all this wind? Well, that's good luck."

Sixty-one in two mornings, and so ended my ducking. The next morning it was bright and clear, and not a duck could be seen. JOHN FIX.

CHARLESTON, S. C.

THE FIRST SNIPE.

THREE English snipe were killed on the meadows this week, one on Thursday and two on Saturday, and no others have been seen. I have not been fortunate enough to get a shot thus far. Will go over the grounds daily, and hope to bag a few birds next week. Quail have wintered well, and large bevies are frequently seen near the village. With a good breeding season we may look for excellent shooting next fall. Ruffed grouse are very scarce, and that noble game bird will soon be a thing of the past in our woods. Woodcock have appeared in fair numbers, and fine shooting may be looked for in July. The best grounds in this vicinity are reserved, and those who are not privileged to shoot on such grounds can make but a poor bag at best. Robins, meadow larks and bluebirds have been with us nearly all winter, and blackbirds have appeared in large numbers. GOOD ENOUGH.

FARMINGDALE, Monmouth County, N. J., March 22.

There was a loud crash as the door of a Newark saloon burst open last evening and a man, who looked not unlike the statue of Gen. Phil Kearny in the park, plumped into a party of sportsmen.

"Say, now! Look a 'ear, look a 'ear, now, say! I've got 'im!" he shouted excitedly. "I've got 'im! I've been tryen' fur fiv'teen year tu git 'im, an' I got 'im at last. I can prove it."

He waved his hands exultingly.

"See the blood!" he gasped, as he continued to poke his fists under the noses of the hunters. He then teetered wildly out into the night.

"In the name of all that's good," exclaimed an old gentleman, a stranger, who, while waiting for the train, was having a quiet beer at the bar, "what has he got? What has he done?"

"Got? Yes, it looks as if he's got 'im," replied a middle-aged man in an old greasy corduroy shooting coat. "It's true what he sez, he's been tryin' for fiv'teen year to get in his claim. He's gallyed us now, by thunder. He's killed him at last. Yer don't understand, don't yer? Well, he's shot the fust English snipe of the season, he has."—*F. Satterthwaite in N. Y. Herald.*

The first English snipe was seen on our meadow March 21. Quail have stood the winter well in this section. S.

NORTH TRURO, Mass., March 24.

Two English snipe were killed at Bergen Point, N. J., March 24, by P. Lumbreyer.

PHILADELPHIA NOTES.

ALMOST all of our sportsmen who have started out for the first snipe of the season have either brought in a showing of one or a couple, or have seen birds on the meadows, which are in a very wet condition in our section. There is a superabundance of overflowed and "navigable ground" near our river shores which will make bad tramping, and so much of it that such snipe that come our way in their northern flight, will be scattered about everywhere. The flight of ducks which I mentioned had reached the Maryland shores last week, instead of making good shooting on the flats from boxes, appear to have settled down in the Gunpowder and Bush River regions. I was informed by both Messrs. McComis and Bancroft, of Baltimore, who are about as well posted on the doings of wildfowl as any gentlemen I know, that the great body of fowl that came are now in sections where box-shooting is not allowed. Perhaps I am a chronic growler on the subject of battery or box-shooting, but it is a fact noticeable to Havre de Grace duckers, that canvas-backs, redheads and blackheads seem to know the difference between a bunch of decoys and a flock of their own kind as soon as they arrive. This is especially noticeable in the spring, no doubt from the recollection of the reception they received on their first coming in the autumn, young, green and fresh from the nesting grounds, and when it is known that on shooting days there are often as many as thirty or forty boxes anchored on the flats near the mouth of the Susquehanna at Havre de Grace, is it any wonder the ducks become educated, and the instinct to avoid such warm receptions on their natural feeding grounds—the battery must be anchored in shallow water—is transmitted to the young, and in time we have an entire change in the habits and actions of the fowl!

To me, point and blind shooting at ducks, as they trade from place to place, is the most legitimate sport of the two, certainly the less destructive. Many geese have begun to go north. The snow geese that were in the Delaware have started to their breeding grounds, and we may look for open weather, I think. Speaking of geese reminds me of a very curious specimen of the breast bone of *Anser canadensis* Mr. McComis, of Baltimore, showed me last week. The breast bone of all water fowl, when devoid of flesh, it is known, has much the resemblance of an old-fashioned skate, an upper bone taking the place of the plate and the sternum the part of the blade or runner. One of Mr. McComis's friends, on cleaning the breast bone of a large goose he shot, found lying on the upper part of the bone three large shot, two encysted and the other detached. No fracture of the bone appeared, and no evidence was found how the shot had

entered. How they got there has puzzled many, but it would seem to me that when the goose was first shot he must have been going away from the shooter and the shot entered in under "the apron," and when their force was spent rested at the place they were found. On comparing the shot with ammunition in his store, Mr. McComis found them to be such as are in Eley's S. T. wire cartridges. HOMO.

March 22.

LONG ISLAND POACHING.

Editor Forest and Stream:

In your issue of March 6, Mr. Lane, after informing you that ducks were being caught in nets by the thousand in Shinnecock Bay, goes on to say that he has notified me at two different times and that I had paid no attention. Before Mr. Lane notified me I had been giving my attention to this matter. I wrote to him in reply to his first letter, asking him to collect me evidence, and that I would at once see to it. He wrote in return that he was tired of trying to have the game law enforced, and that he expected that he could rely on me, etc. I have taken every possible means at my own expense to stop this violation of the law, but it is impossible for me to succeed unsupported, and all the inhabitants of the locality are all more or less engaged in the business, and act as spies on my proceedings. Mr. Lane probably knows by this time some of the difficulties which lie in the way of an enforcement of the law.

In your issue of March 20 there is a letter from Manorville with reference to the trapping of partridges. I am aware that from Riverhead to Babylon, and also on the north side, the woods are lined with partridge hedges. I made a great effort to catch the parties, and many of the hedges were destroyed, but none of the offenders could be trapped. If gentlemen who are credibly informed of the trapping of birds or other violations of the law, will give me the names of witnesses I will see that the offenders are attended to. They should recollect that I have a coast of 300 miles and about 2,000 square miles of territory, and I cannot, nor can any man, act personally in all cases.

Perhaps if persons buying wild ducks knew that a duck netted and drowned turns black, they would not be so easily sold, and if there were no sale of course there would be no catching.

GEORGE W. WHITAKER, State Game Protector.

SOUTHAMPTON, L. I., March 24.

SOUTH CAROLINA DAYS.

THE hot, dry summer of 1883, while very disastrous to field crops in this section, was very favorable for birds, and, per consequence, the long sedge cover on the hillsides overlooking the beautiful Catawaba is literally swarming with the brown beauties. In almost every piece of sedge, in every rough, uncultivated patch of any size, you are sure, with a good dog, to find game, and a three hours' tramp from my house on a good day will be rewarded with a sight of from eight to twelve coveys. It is true they are pretty wild and strong and swift of wing, and as I have good reason to know are exceedingly hard to hit. Still the sport is magnificent. Many a long tramp, and many a glorious day's shooting have I had this past season, in company with my genial friend, that clever sportsman and truly typical English gentleman, Capt. McMurdo, of Charlotteville, Va.

With the exception of one short spell, we have had a very mild winter. This month (February) has been about as warm as the average April, bright and beautiful, the very ideal weather for outdoor sports. Just such days as induce the partridge to go far afield in the early mornings and late evenings in search of food, and to lie cozily and lazily beneath pines in the warmer mid-day; so close and still that nothing short of a first-rate dog can then find them; so close and still that after your dog has made game, and is standing stiff as bronze on a "dead point," you peer curiously and anxiously into the short cover, see nothing but the short grass and dead brown leaves, and are almost persuaded the point is a false one. The dog is gently urged forward as you pass him, but stubbornly refuses to move, indicating by the slightest turn of the head the direction of the birds. On, on a few yards further and then, just under your feet, with a thrilling whirr, around, behind, before, and on either side, away go the birds; and too often, in spite of the best formed resolutions, off go the guns also before the game is properly covered, and at least half the shots fail to count. By the way, how rarely, except in the written accounts, do we ever see a really effective right and left on quail in February or March.

As there is no rose without its thorn, so there is no covey without its pine tree or trees, and long practice in eluding hawks has taught the cunning Bob Whites exactly how to take advantage of their friendly cover, and many a charge of shot, like the dagger of Roderick Dhu, finds "bloodless sheath," not in the earth, but the soft brown bark of the dwarf pines, while the intended victim, with the speed of the wind, seeks further safety in some neighboring reed brake, or amid the warning leaves of a convenient hillside.

A day's shooting behind Strother's Doctor Duer (Gladstone—Frost) and Perkins's imported pointer Mainspring, among as many birds as we have had this season, is a thing to be remembered with pleasure, when gray locks and uncertain legs shall have rendered all such joys a thing of the past, and when these two splendid representatives of their rival breeds are remembered only by the excellence of their offspring.

Allow me to predict that with continued good health and a fair amount of practice before the next field trials, Mainspring is going to make things lively for the best, not only of his own race, but the very best and fastest of the setters also. I have yet to see the setter that has the heels of him; no dog can have a better nose, and none be more sagacious or more easily controlled. I am perfectly satisfied that he is the very best pointer I have ever seen in the field, and is going to make a flutter in sporting circles when brought to the test.

Doctor Duer has about graduated, and is good enough for anybody. Keen, well-broken, handsome, and with brains enough to represent the Seventh South Carolina district in Congress. Doctor Strother will have to try a good many times before he gets a better or even as good a dog.

Dexter's Dirk and Del, pointer pups, Heald's Snowdon and McMurdo's Gloster, setters, are still in their nonage; all coming on well, and at least two of them will be heard of in the next Derby.

After a long day's tramp, a dinner and a smoke, I usually have two hours more of pleasure before me, passed in a game of backgammon and chatting with Capt. McMurdo, who, with all his modesty and reserve, has had many adventures "by flood and field," and it is indeed a privilege to a backwoods member of the "Stay at Home Club" like myself, to listen for hours to the conversation of an intelligent and enthusiastic sportsman, who has shot peacocks, ibex, pheasants and migratory quail in India, cinnamon bears and leopards in Cashmere, snipe and woodcock in Turkey and Asia Minor, black game in the Highlands, red grouse in England and Wales, woodcock and water fowls in New Brunswick, ruffed grouse on the Blue Ridge, and prairie chickens in the far West, to say nothing of that gamest and most difficult of all game birds, the wary, beautiful little Bob White, along the banks of the Catawba. W. R. D.

LANDSBORO, Chester County, S. C., Feb. 28.

ROCKY MOUNTAIN RAM AND GRIZZLY.

ABOUT thirty years ago a man named John Dunson, then a resident of Western Canada, went to the Rocky Mountains for the benefit of his health. And here it may not be amiss to say that, although then suffering from the effects of a pulmonary complaint, after a few years' residence on the slopes of the backbone of America he grew strong and robust, and completely recovered his health. One day, while digging for gold, near Pike's Peak, in a ravine, he heard a noise above him, and on looking up saw a bighorn of the largest size, a regular giant—old Cimmaron of the hills—with an immense pair of horns, standing in a narrow pass winding up the side of the mountain. The great horned sheep appeared to be intently watching some object other than the miner, which soon became manifest, as a large male and female grizzly and two well-grown cubs made their appearance, ascending the path upon which the bighorn was standing. When the great *Ursus horribilis* arrived within about fifteen feet of the sheep the latter lowered his head and descended upon his foe with the rush of a battering ram. The sudden and heavy stunning shock overturned the bear; but, before the assailant could recover from the momentum, the she bear caught him in her grasp and dragged him down, when her stunned partner, having recovered, the fierce animals made a feast upon the carcass of the fearless bighorn. It is a well-known fact that the bighorn of the Rocky Mountains is more than a match for the bull bison; but this is the first instance that I have heard or read of that a Rocky Mountain sheep has dared to face the fierce and formidable tyrant of the hill and the cañon. I have given the story as related by the witness, and have not the slightest reason to doubt its correctness. W. P. L.

OTTAWA, Canada.

THE AMERICAN DEER FAMILY.

THE ANTELOPE AND DEER OF AMERICA. By John Dean Caton. New York: Forest and Stream Publishing Company.

IN this volume, a second edition, may be found important alterations and additions, the result of Judge Caton's further studies in a most interesting branch of natural history. Perhaps no one in this country has devoted more attention to this subject than the author, for not only is he master of the scientific data, but has had the good fortune to note the characteristics of the American Cervidæ *in loco*, and for the purpose of comparison has been a keen observer of deer in other countries.

Beginning with the prong buck, or, as it is generally known, the American antelope (*Antilocapra americana*), the specific differences between it and the true deer, the moose (*Cervus alces*), wapiti deer, American elk (*Cervus canadensis*), woodland caribou, reindeer (*Cervus tarandus*), mule deer (*Cervus macrotis*), Columbia black-tailed deer (*Cervus columbianus*), common or Virginia deer (*Cervus virginianus*), the barren ground caribou (*Cervus tarandus arctica*), and the Acapulco deer (*Cervus acapulcensis*), are explained. The main peculiarity of the American antelope, which distinguishes it from its kindred ruminants, is to be found in the manner of growth of the horns. Audubon and Bachman doubted the statement of the early hunters, that no person had ever shot or killed an antelope without horns; but the hunters, says Judge Caton, were right and the scientific men wrong. In 1848 Dr. C. A. Canfield, of Monterey, first made the statement that the antelope had a hollow horn like the ox, and that this horn was cast off and renewed annually. This statement seemed to be so contradictory to all established zoological laws that it was hardly credited until some eight years afterward, when the Superintendent of the London Zoological Gardens published the facts in the proceedings of the society. In 1865 Judge Caton, unacquainted with the prior studies of Canfield and Bartlett, in a paper read before the Ottawa Academy of Natural Sciences, affirmed the same fact. "The antelope has a deciduous hollow horn, which envelops a persistent core, which is a process of the skull, like the core of the persistent horns of the ruminants * * * only the lower part of the horn is hollow, the core extending up scarcely half its length." The core is persistent, but when full development comes in October, this envelope of horn is cast off, to be renewed again. When the old horn is cast off the new one shows considerable growth above the core. Prof. Curtis, of Chicago, studying with the microscope the various stages of growth in the antelope horn, has rendered this curious subject quite clear. One peculiarity of the *Antilocapra americana* is the system of cutaneous glands. The activity of these glands is not confined to the rutting season, but the odor may be observed in all seasons; nor is it confined to the male, though the presence of these glands in no way affects the flavor of the flesh. The antelope is the fleetest of all animals, but, curiously enough, though it can leap over flat surfaces, it seems to be wanting when a perpendicular object arrests its flight. Caught in an inclosure, Judge Caton found that an antelope would not jump a fence three feet high. The prong buck is easily tamed, "soon loses all fear of man, seeks society, and enjoys his company."

After giving a description of each of the species of deer, with their characteristics, the author enters into more particular details, so that, by comparison, an excellent conception can be had of the similitudes and differences of the species. Commencing with size, the moose is the largest known living representative of the Cervidæ. An extinct deer, the bones of which came from Ireland, however, exceeded it in bulk. The maximum weight of the moose is 1,200 pounds, and its height, anteriorly, 6½ft. The elk will measure 16 hands in height, and will weigh, in a fine specimen, 1,000 pounds. Judge Caton killed a 5-year-old elk which weighed 900 pounds. Between the elk and the caribou the difference in weight is quite marked, 400 pounds being a good average, and it is less in size than the Lapland animal. Mule deer will weigh 250 pounds; Columbia black-tailed deer not much more than smaller kinds of common deer, say, 150 pounds, though the *Cervus virginianus* has been killed which would tip the scales at 248 pounds. Perhaps in certain seasons the Michigan deer are the heaviest. The smallest of the race is the Acapulco deer, and a very large one will weigh 50 pounds, but 40 is a fair average. Judge Caton has paid marked attention to the coat and color of deer, studying the spots which ornament the fawns of the Virginia and other deer, as traces of these spots were observable in some of the adult species. "I believe," writes Judge Caton, "these spots on the adult Virginia deer have been entirely overlooked by naturalists till I mentioned them to Mr. Darwin, when he noticed them in the "Descent of Man." The theory which naturally takes consistency from this is that at some prior period the *Cervus virginianus* was spotted like the fallow deer, and that in time it may disappear on the fawns as it has "nearly disappeared on the young of the moose and caribou, and has even now much faded under elk and caribou."

We think, from Judge Caton's observations, carried over a long period, that the danger of keeping males of the American Cervidæ in public parks, the Virginia deer not excepted, is pretty clearly proved. All these animals, in certain seasons, are likely to attack man. When in captivity the male deer loses that dread of man which is his natural condition when wild, and from familiarity there comes contempt. The elks in Judge Caton's North Park have more than once occupied their own ground and bid defiance to human intruders. Under such circumstances, when their anger is excited, elks must be quite formidable antagonists. Judge Caton writes:

"Three men, who thought they knew best and were not afraid of anybody's elk, scaled the fence and quietly walked along till they met the herd of elk, when the leader started after them with a dignified walk. They thought they had seen enough, and commenced an orderly retreat. The elk increased his pace, and soon treed two of the party and killed the other. One of them, a young, active, athletic man, left his tree and, by running from tree to tree, finally escaped, gave the alarm, and raised a party, who fought the elk with pitch-forks till they were finally driven off, although at first he drove three resolute active men thus armed several hundred feet before they could sufficiently break his guard to compel him to acknowledge the virtue of sharp hay forks. He did not charge on them with a rush, in the ordinary way of joining battle practiced by all the deer, but lowered his head so as to bring his face nearly parallel with the ground."

When the elk gave way it was a slow and sullen retreat, not a flight. When his keeper came the elk tried to kill him, and the man only saved his life by his courage. Next day it was determined to castrate the elk, and Judge Caton, with two other persons, had a severe tussle with him, for he was still undaunted. After the operation was performed he got wicked again, but soon all vicious symptoms left, and in a week he was as docile as a lamb. Judge Caton believes that such viciousness is rather exceptional. When buck elk fight, a common occurrence, they give voice which resembles something like the sound of a steam whistle, which can be heard half a mile. Sometimes in their battles they kill one another. The wapiti is more readily domesticated. A curious trait of the elk fawn is that when captured it will feign death. If you pick them up they are as limp as a wet rag, the head and limbs hanging down, without the least muscular action, the bright eye fairly sparkling all the time.

Efforts to domesticate the mule and the Columbia deer have been failures. In captivity not one of the Cervidæ seems to reproduce their kind as rapidly as when in the wild state. Judge Caton's chapter on the hybridity of the Cervidæ shows how thoroughly he understands this curious subject. He has succeeded in only four cases. He crossed a male Columbia with a female mule deer, a Ceylon with an Acapulco doe, a Virginia with a Ceylon doe, and a Virginia with an Acapulco doe. The cross between the Ceylon and Virginia varieties seemed to do the best. Although a cross was attempted between an elk and a Durham heifer naturally no progeny came from it. Prince Pless, in Silesia, has succeeded in crossing the wapiti and the common red deer. Judge Caton is certainly right in noticing this cross. He is of the opinion that it is not a case of hybridity, as undoubtedly the wapiti and the European stag have descended from the same progenitors. In his chapter on the chase are presented many pleasing incidents.

For the naturalist and the sportsman Judge Caton's book is of great value. It is not a dry compilation of concrete facts, made up in the study, but contains the exact experiences of a gentleman who has a direct interest and a practical acquaintance with the subject he exhaustively treats.—*New York Times, March 17.*

A PLEA FOR THE BIRDS.—*Editor Forest and Stream:* The discussion of the "destruction of our song birds by amateur ornithologists" is one of interest. I venture to say that fully one-half of the bright little lives so taken are of no benefit whatever to the collector. Rare specimens I grant may be secured for study, but surely it is nothing but wantonness that prompts the destruction of our many varieties of familiar birds. And here let me say, if you wish to study, build a "bird tank" and take your study from life. Do not take the life from your study! If an unusual visitor shows himself, identify him; but in mercy think twice before killing. This "bird tank" may be a hobby with me, but if only 25 per cent. of your many readers will try it, many hundreds, yes and thousands, of little victims will be spared to gladden the woods with their songs. Buy an opera glass, build a bird tank and then let us hear from you.—WILMOT (New York, March 21).

A BOUNTY ON FOXES.—Maine needs a bounty on foxes. They are very destructive to our game, and not only to game, but the poultry yards suffer from their depredations. Grouse seem to suffer more from them than other game for this reason. In cold weather the birds burrow in the snow through the night, and the keen scented fox soon finds them, and they fall an easy prey to reynard. Foxes never were so plenty as they are now in Maine, and unless something is done to destroy them, our noble game bird, the grouse, will soon be counted among things of the past. One can hardly go into the woods without finding the remains of a grouse or rabbit where reynard has dined. Now, brother sportsmen of Maine, let us push this question, as it is of great interest to us all. Let us wage war on the fox, and every farmer will hail with joy the sportsman that destroys his worst enemy. Let us hear from others of your readers here in Maine.—L. H. H. (Gardiner, Maine, March 17).

BIRDS IN GREAT SOUTH BAY.—The geese, brant and duck are becoming quite numerous in our bay, and some of the sportsmen are having good shooting. To have good sport it is best to be on the bay when there is a good southerly or easterly wind blowing, which keeps the birds in the bay. A northwest wind is very unfavorable, as it generally drives the birds to the ocean. There are some batteries used here, but the shooting is done mainly from points with a boat and decoys. There being quite a number of islands in the bay it makes the point-shooting more convenient and desirable. —GEO. KILIAN (South Oyster Bay, L. I., March 25).

VIRGINIA.—Staunton, March 17.—The birds wintered well here, and the prospect for good quail and grouse shooting next fall are as good as I ever knew them to be. The frequent and deep snows in the mountains west of us promise good results to the trout streams, by keeping up a good tide all summer. The headwaters of Greenbrier, in Pocahontas, are full of these fish, and from the middle of June to 1st of September there is no such fishing that is as accessible to fishermen from the Northern and Eastern cities as these streams, and none that yields so generous a return to the angler.—WHACK.

MASSACHUSETTS BIRDS.—While walking in the woods today with a friend and his dog, to see how the quail got over the winter, we flushed a nice covey of partridges, ten in number, and a pair of woodcock, but saw no quail. This is rather early for the longbill around here, as I found none till the first of April, last year. Snow is from four to five inches deep in the woods yet. Robins and bluebirds and song sparrows, and the red-shouldered blackbird are a week behind last year.—J. F. D. (Danvers, Mass., March 22).

HORICON SHOOTING CLUB. The Horicon Shooting Club was organized at Fond du Lac, Wis., last week. The following officers were elected: President, T. S. Weeks; Vice-President, S. B. Amory; Secretary, C. S. Mattison; Treasurer, W. S. Russell. The club holds the lease of about 10,000 acres of Horicon marsh (which is considered the best ducking ground in the State), and are proceeding to erect a suitable club house thereon.—HORICON (Oakfield, Wis., March 17).

NOT YET.—Was out Tuesday to try the ducks, but failed to get a shot. I only saw two flocks of ducks all day. I saw quite a number of ducks flying this morning; also heard of a few English snipe being seen near the Great Swamp. Will try the meadows for snipe on Saturday. The meadows will be in first-class condition for snipe this spring, and I hope I will be able to report some good bags.—16-BORE (Madison, N. J., March 20).

NEW GUN WAD.—We have received from the Merino Elastic Felt Gun Wad Company, of Baltimore, specimens of the new wad which they are about to introduce. It is claimed for these that they combine the advantages of other felt wads with greater cheapness. Messrs. Clark & Sneider are said to have tested them with good results.

OVER SEVENTEEN THOUSAND MEN were paid cash benefits in 1883 by the Travelers Insurance Company, of Hartford Conn., for losses by accidental death and disabling injury.—*Adv.*

Sea and River Fishing.

LONG OR SHORT RODS.

Editor Forest and Stream:

In common with many other fly-fishermen, I have been much interested of late in reading the discussion in your excellent journal of the relative merits of long and short fly-rods. Syracuse possesses a large number of expert fly-casters, as the records of the State tournament show, a fact largely due to the exertions and enthusiasm of the lamented Reuben Wood, and all of them take a warm interest in everything pertaining to the manly sport. Now, in considering this question of short against long rods, it seems to me the only points to be regarded are, the relative merits of the rods for actual fishing purposes.

I have long regarded the annual contests at the State tournament as very imperfect tests of the merits of either rods or anglers.

Distance seems to be the most important element, and delicacy and accuracy of casting secondary. In actual practice, I think every experienced fly-caster will agree with me, that these elements should be reversed, and a man's skill be determined by:

First, delicacy; second, accuracy; third, distance.

With these points in view it becomes very important what kind of a rod to use. To secure the best possible results a rod should be made to combine in the highest degree, delicacy of action, strength, and lightness and ease in handling.

A rod may be light and strong and yet so heavy in its action as to require much muscular exertion of the wrist, and so make the sport of fishing very fatiguing, while another rod equally strong and light may work so softly and with so little expenditure of strength that a long day's fishing will not weary the fisherman. Now, all short rods, so far as my experience goes, are stiffer in their action than long rods. Their best work can only be done at long distances, and only then by the exertion of a good deal of muscle. Even then, except in the hands of experts, the flies are apt to drop with a splash. In brook and stream fishing, long casts are seldom necessary, and often impossible, on account of obstructions preventing a recovery of the line. With long rods, on the contrary, say of eleven to twelve feet, gradually tapered, the spring is more soft and delicate and evenly distributed, than in the short rods.

A very slight exertion of the wrist will put sufficient spring into the rod to carry the flies to the full limit of the strength of the rod, accurately, softly, and without "swishing the flies, and they will drop at the end of a taut line, without a ripple. Such a rod as I have described, and have the delight of possessing and using, works equally well at either short or long distances. The muscular exertion is so slight that the angler can cast all day without fatigue, with either hand.

Mr. Wood sometimes used short, stiff rods in casting at the State tournament, but invariably used long rods in actual fishing. Indeed, for the past two years he used a long salmon rod, of sixteen or eighteen feet for bass fishing.

ONONDAGA II.

SYRACUSE, N. Y.

THE POLLUTION OF RIVERS.

THE fact that our rivers are used as sewers by all persons who may have refuse, which they can get rid of by dumping them into the water with less expense to themselves, is one that needs to be constantly presented to our legislators. It is bad enough for a man to put a dam across a stream and deprive the people above him of their fish, in order that he may make money, but when he adds to the injury by polluting the waters below him, it is time that he was made aware that he is a nuisance which should be abated. Sawmills and tanneries are among the principal offenders in this line, and their refuse can be found for miles below them, rotting and spreading not only death to fishes and their deposits of eggs, but malaria to the unfortunate people who live about or frequent the stream. That sawdust is fast filling the Upper Hudson is well shown in the following communication in the New York *Herald:*

"The newspapers have informed the public of the necessity of insuring the water supply of the Upper Hudson, but they never have been told of a flagrant practice licensed by years of indulgence, a practice burdensome to the taxpayers of this State, ruinous to the Upper Hudson and poisonous to its valley—namely, the annual dumping of several thousand tons of sawdust, edgings, sticks, chips, etc., from fourteen sawmills into the Upper Hudson. The sawdust dumped is burdensome to the taxpayers of this State, because large quantities of it carried away by high water help to form bars in the river near Albany, the removal of which costs the State $50,000 a year. In 1867 the State paid $525,000 for the dredging of bars near Albany, no small part of which was sawdust. The dumping of sawmill refuse is ruinous to the Upper Hudson, because at many points below Glens Falls Feeder Dam it has clogged, choked and filled the channel, so that in summer a person can walk across it without wetting his feet. At Fort Edward an accurate survey has shown that sawmill refuse to a depth of eight feet, more or less, covers eight acres of the river's bed within the corporation limits of that village. It is ruinous, because for miles below Fort Edward in summer, when the water of the Upper Hudson has fallen, little remains to mark the river's course, save great bars of sawmill refuse, so completely has its channel been filled in. I saw last summer below Fort Edward immense bars in places in the channel, where fifty years ago I fished where the water was from thirty to forty feet deep. I remember when the channel of the Upper Hudson was clear and well defined. That was before the dumping of sawmill refuse was so great. Nowadays bars of sawmill refuse are formed with great rapidity, because the volume of the Upper Hudson is yearly growing smaller, its channel—what remains of it—narrower and shallower, and the dumping of sawmill refuse greater. Years ago canal boats were floated up the river to Fort Edward. Now there are times when not even a rowboat can be floated to that place on what is called the Hudson.

"The dumping of sawmill refuse is poisonous to the valley of the Upper Hudson, because the rotten accumulation of acres and acres of refuse lodged in its channel breeds diseases which fifty years ago, when the channel was clear, were unknown to the inhabitants of that valley. Alas! I have lived to see the river that once was a full, clear, active, unobstructed, uninterrupted stream, transformed to a filled up, dried up, snake-like creek. But what will it be a few, very few, years hence if the dumping of sawmill refuse continues? Must the people of this State be taxed that the Upper Hudson may be sacrificed to the convenience and profit of a few sawmill owners? Must the people stand silently by and see an important part of the Hudson River filled up with waste and refuse without lifting one hand to stop it? Must health be destroyed and life taken to satisfy the avarice of a few sawmill owners of Northern New York? If so there is a sad scarcity of men among us—and especially among our so-called lawmakers."

THE DOWEL QUESTION.

Editor Forest and Stream:

I have read with considerable interest the several discussions in your paper concerning the dowel pins in fly-rods. I think Mr. H. P. Wells is right in every point, although I have never used a rod made without dowel pins, for the reason that there are no ferrules in the market suitable on account of being made tapering. I have used rods with the lap joints (no ferrules) with good success, except just the point that Mr. Wells condemns them on; the liability of the thin ends of splices to accident is just where the failure comes in. I have made rods for the trade for a good many years and used rods many more, and I certainly can see no use for the dowel pin, when we can get straight ferrules or tubing as Mr. Wells recommends. Will not Mr. Wells inform me either by mail or through your valuable paper where such tubing or ferrules may be had, for which I will be under obligations to him and the FOREST AND STREAM.

E. M. E.

HANCOCK, N. Y., March 21.

The above letter has been submitted to Mr. Wells, who replies as follows:

Editor Forest and Stream:

The ferrules, the complete success of which in actual and severe use inspired me to agitate the subject of dowel pins, were made from German silver tubing drawn for me by Mr. John H. Knapp, manufacturer of gold and silver pen and pencil cases, No. 17 John street, New York city.

Mr. Knapp drew these tubes from time to time as a favor, it being a small matter, and aside from the usual business of his factory. Being somewhat doubtful whether he would care to do this for others, I called on him to ascertain. He will fill such orders as he may receive for brass or German silver tubing, drawn inside and out, at the following rates: Brass, from 10 to 15 cents a foot; German silver, from 15 to 25 cents a foot. The length of the tubes will be from 3 to 5 feet, as desired, but the whole tube ordered must be taken, since of course fragments are useless to him.

The tubing for the male ferrules, as supplied me in the past by Mr. Knapp, has been just a shade too large to enter the female ferrule, so as to permit nice fitting. This tubing was beautifully drawn inside and out, and of good "temper." Mr. Knapp prefers samples should be sent with orders. He can supply any size which does not exceed half an inch in diameter.

HENRY P. WELLS.

Editor Forest and Stream:

I am very glad that the dowel question for fishing rods is being ventilated in your columns. I have fished for the last twenty-four years for black bass, and have made during that time about twenty rods, none over ten ounces in weight. I have never used the dowel with the exception of a piece of one-eighth inch brass wire of about one inch in length let in to the butt end of the second joint and proportional boring in the small end of the butt. This I find steadies the joint at that place and does not detract from the strength, as the hole in the butt is so small. I have never yet had the joints pull apart, and have fished about all known ways for bass, and am satisfied for my part that the dowel is not actually required. It is only an additional labor to fit them. I use the swelled ferrule, thereby getting the full size of the wood.

It may not be amiss to inform those of your readers who are, like myself, amateur rodmakers, how the wire is fitted. I cut a fine thread on the part that is to go in the middle, or second joint, for about half an inch, leaving three-quarters uncut which is to enter the butt. Then take a small piece

A, the Morse drill, ⅛ inch. B, the wood fitted to the inside of butt ferrule. C, bit stock.

of wood, fit it to the female ferrule of the butt, bore a hole with an one-eighth inch Morse drill, leaving three-quarters of an inch protruding through this piece of wood. Bore the hole in the butt, the piece of wood that you have fitted is a true guide.

W. K.

THE RAINBOW DARTER.

Editor Forest and Stream:

Inclosed you will find a small fish which I send you for a name. It was caught in a small stream in this locality this winter, when getting minnows for bait. It is something out of the knowledge of any one in this section. Please give it a name and general description, and if they are common.

W. H. JOHNSON.

LINDEN, Mich., March 6.

[The fish is one of a large family called "darters," *Etheostomatidæ*, which seldom grow to over a finger's length. They usually inhabit swift brooks, and lie in the sand or on the stones and dart by a movement of the pectoral fins. Most of them are plainly colored. There are about thirty species arranged in a dozen genera. The specimen sent is brilliant with blue and orange even in death. We take the following description from Jordan's Manual of the Vertebrates: "Rainbow darter, blue darter, *Pœcilichthys cæruleus* (Storer), Agassiz. Rainbow fish, blue Johnny. Olivaceous, tessallated above, the spots running together into blotches; back without black lengthwise stripes; sides with about twelve indigo blue bars running obliquely downward, most distinct behind, separated by rich orange interspaces; caudal deep orange, edged with bright blue; anal, orange with deep blue in front and behind; soft dorsal chiefly orange, blue at base and tip; spinous dorsal crimson at base, then orange with blue edgings; ventrals bluish, often deep indigo blue; throat and breast orange, these two shades very constant; female much duller, with but little or no blue or orange, the vertical fins barred or checked; colors fade in alcohol; body short and stout; head large; D, X—12; A. II, 7; lateral line 45 scales; length two to three inches. Mississippi Valley, abundant; the most gaily colored of all darters." This would make a gorgeous fish for an aquarium, and should be brought East for this purpose.]

BIG BASS LAKE.

HERE we are on the ice. The thermometer is at 14° below zero, and is undecided whether to slide still lower or stop short. We have been fishing for the past week, with grand good luck, and now we have but one more day and then home. We have averaged thirty-five lines each day, and our lines have been busy, as you may judge when six hours each day was our actual fishing time. A week ago we packed up a bundle of "tip-ups," packed our satchel, filled our grub bag and started for Big Bass Lake. It was cold when we left home; it was colder when we struck the lake, and by the time the ice was crossed and we had reached our camping place it was solid cold.

Last summer we had fished here and built a log hut, and now we find it still intact. Our axe cuts boughs from the nearest hemlock for our bed, and that tall spruce gives us a load of its branches with which to cover the hut. Over these we pile snow, and pack it down hard. Now we have as snug a den as we could wish. Our camp-stove burns in one corner, our bed is in the other.

Supper over, to bed. The next morning I am the first awake, and so I get breakfast ready, and then for the ice. I won't tell you about the trials of cutting the fishing holes. You who have fished through 24-inch ice can appreciate it. I have never seen fish bite as quick as here. They seemed to have been starved, and we could hardly attend to the lines. The lake trout were the largest fish caught, and seemed to bite the least sharply. Our bait was first-rate, as lively as crickets, and a great many were the popular "red fins," and though in summer in the same waters we had no luck using "red fins," in winter they were the best bait.

We give a table of our catches of the six days at the lake, and think it will compare favorably with the same number of traps, etc.

First day, 70 fish, weighed	250lbs. 5oz.
Second day, 100 fish, weighed	401lbs. 14oz.
Third day, 91 fish, weighed	320lbs. 2oz.
Fourth day, 66 fish, weighed	200lbs. 1oz.
Fifth day, 79 fish, weighed	215lbs.
Sixth day, 82 fish, weighed	202lbs. 4oz.
In six days 488 fish, weighed	1,689lbs. 10oz.

SIZE OF FISH.

First day, smallest fish	2lbs. 4oz	largest....10lbs.
Second day, smallest fish	3lbs. 1oz.,	largest ...17 9-16lbs.
Third day, smallest fish	2lbs.	largest ... 5 1-16lbs.
Fourth day, smallest fish	2lbs. 5oz	largest ...14½lbs.
Fifth day, smallest fish	2lbs. 1oz.,	largest.... 7½lbs.
Sixth day, smallest fish	3lbs. 4oz.,	largest....11 15-16lbs.

The smallest fish was a pickerel of two pounds, the largest a whale of a lake trout. The fish ran very even, as a general rule, but now and then a whopper got on to the line and made it sing.

Now, many of your readers may be curious to know where the lake lies that we fished in. We are sorry that we cannot publish it. We have fished this lake in summer and winter, and the fishing is grand. In the summer the bass fishing is unsurpassed.

The expense of the trip we have just taken, exclusive of personal conveniences, was—

Bait, 1,500, at $4 per 1,000	$6 00
Fare, railroad	8 00
Food and drink and other expense	8 00
	$22 00

Making $11 for one person for a trip of a week. We don't give this as a criterion to go by, as on one occasion in the early winter our expense was $20 apiece, and again at Christmas time only $9 for a week; still it is a fair average.

TWO BROTHERS.

VERMONT FISH LAWS.

THERE is no State in the Union, and probably no country among civilized nations, where the laws for the preservation of fish are so set at naught, and so openly violated, as in Northwestern Vermont. In Franklin county, within the immediate vicinity of one of our two Fish Commissioners, there are dozens of seines, pound and fyke nets, fully manned and constantly at work during the close season, sweeping the fish out of Lake Champlain's waters. Some of the nets are owned by parties from New York State, who, during the fall of 1882, came into this vicinity and, within fifteen miles of our wide awake Commissioner, built a large ice-house, where they have stored tons of fish caught illegally. It has been estimated by those who are posted that during the close season of 1883 from fifty to seventy-five tons of fish were caught in these waters and shipped to New York and Boston markets. Several writs were issued and served against some of these fishermen, but so far we have yet to hear of a single conviction. The Governor of the State appoints our Fish Commissioners, and it is to be regretted that for this locality he did not appoint a man who not only understands the duties of his office, but has moral firmness enough to put the laws into force. At the next State election a strong effort will be made, irrespective of party politics, to elect representatives who will do their utmost to remedy these evils by making provision to have competent men appointed as fish wardens. About a year ago an officer visited this locality and was driven over the ice within a few yards of holes cut in the ice, where trap nets were set and barrels of fish taken out daily, but he did not know what those holes were cut for and passed them by without examination. With a short pole with hook on it he could have fished something out of the water there that would have astonished him—trap nets of the most destructive kinds. I have no doubt but what the intentions of this officer were good, and that he intended to do his duty faithfully, and had he been "posted" or engaged a trustworthy guide, that he would have succeeded in capturing quite a number of large trap nets, and temporarily put a stop to this work.

STANSTEAD.

HIGHGATE, Vt., March 13, 1884.

SEA BASS IN CANADA.—An unusual development in bass fishing was made this winter in the Tidnish River, which forms the north shore boundary between New Brunswick and Nova Scotia. Last spring when the heavy ice left the river, an old farmer found some dead bass on the flats where they had evidently been crushed by the tide letting the ice down on them at low water. This winter, about a month ago, he cut a hole in the ice, and found the river so full of sea bass that he resolved to use a scoop net instead of hooks and lines. With the scoop nets, five tons weight of the fish were caught in one night, and since that two or three thousand dollars worth have been shipped to the Boston market. It was never before suspected that bass came there in winter.—B. (New Brunswick, March 20).

THE BISBY CLUB.

A VERY interesting report of the Bisby Club for the years 1883-84, gives an idea of the work and pleasures of this association, which has its grounds on the Adirondack lake which gives the club its name. In speaking of the accommodations of the club being taxed to their utmost during certain months, and the lack of visitors at other times, the report says: "There is every year a period when our accommodations go, as it were, 'a begging.' This is in the delightful month of July when the sun shines brightest, and the cooling shades of the woods would seem most welcome, and when the fish in the lakes are active in search of food in the deep water, and are consequently readily taken at the buoys. But this is the time our guests are fewest in numbers. Probably the bugbear of flies is what keeps people away. The flies in July are but little more than a bugbear. The winged fiend of the woods is the black fly, but his season rarely lasts through the month of June. When he leaves, the mosquitoes have the field to themselves, but the mosquito of our northern wilderness is not the venomous monster that haunts the seaside watering places, and the lagoons of the open country. His song is more nervously exciting than his bite, though the latter is to be avoided rather than permitted; but after all, the pleasures of life in the woods in the dog days far outweigh the discomforts of the insects. We recommend the month of July to all who would see the woods at their best, and receive the benefit of the purest and most exhilarating air."

The fishing last year was the best within the experience of the club. In Woodhull Lake many fine land-locked salmon were taken, and the run continued till late in June. The stock of fish in the Bisbys was replenished from the State hatchery at Caledonia by 18,000 brook trout, 6,000 lake trout, while in Woodhull 5,000 rainbow trout were planted, and 15,000 more were placed in Moose River. A hatchery has since been built, and there are now in the troughs 50,000 lake trout eggs, 40,000 hybrids, and 10,000 brook trout.

The better observance of the game laws for the last four years has resulted in the increase of deer, and the shooting was better last year than ever before in the history of the club. A larger per centage of the deer were young than formerly, of the deer killed, there being more bucks than of any other kind. During the visit of the Governor of the State, Hon. Grover Cleveland, the report says: "A fine buck passed within a few feet of the Governor's stand, but a ledge of rocks intervened, which prevented a shot. The same deer passed within club shot of the guide, Frank Hall, but as he had neither gun nor club, the deer escaped." This, we take it, is not seriously meant, yet it is so written that persons not familiar with the personnel of the party might construe it into a regret that the deer was not killed, even with a club. The Bisby Club is doing good work in enforcing the laws in its own grounds and contiguous territory and in stocking the waters, as well as in preserving the timber. It has twenty-five members. Gen. R. U. Sherman is the President, and Mr. Henry H. Thompson the Secretary. If all the clubs in the Adirondacks were as vigorous as the Bisby, there would be a better enforcement of the laws and consequently more fish and game in that region, which is only fitted to produce these forms of life together with a limited amount of timber and a great deal of water. The greed of the lumberman and the bark stripper, however, are to be combatted, or the whole region will soon be a barren waste, from which the rapidly melting snows will produce such freshets as the cities of Pittsburgh and Cincinnati have lately seen, while in mid-summer our canals and rivers will be dry.

IT IS PROBABLY TRUE.

A CORRESPONDENT clips from the Boston *Transcript*, of March 18, the item telling that the Hon. Hannibal Hamlin has just returned from Moosehead Lake, Maine, with a fine catch of trout. Then the correspondent heaves a groan and utters that, if a poor devil were camping out in Maine and tried to vary his bill of fare by shooting a deer or caribou before Oct. 1, the game warden is pretty sure to find it out and "sock it to him" accordingly. But the honorable gentleman makes his annual trip and comes home "with a fine catch of trout," caught through the ice, against the law of the State.

Now, Mr. "C. G. G.'s" mind will be entirely set at rest by reading carefully a proviso to Section 48 of the fish laws of that State: "Provided, however, that during February, March and April citizens of the State may fish for and take land-locked salmon, trout and togue, and convey the same to their own homes, and not otherwise." But "C. G. G." must read this proviso and then turn to Section 1 of Special Laws of 1881: "No person shall take, catch, fish for or destroy any trout or land-locked salmon in the Kennebago, Rangeley, Cupsuptic, Mooselucmaguntic, Mollychunkamunk and Welokennebacook lakes, or in the streams flowing into or connecting said lakes, during the months of February, March and April of each year."

Now, the Hon. Hannibal Hamlin did not fish in either of the above lakes, but in Moosehead, where he had a legal right to, in February, March or April, being a citizen of the State, and doubtless taking the fish to his own home. It is well known of the Maine Fish and Game Commissioners in their work that they have been unrelenting to honorable as well as dishonorable—breakers of the game law are generally dishonorable. Even ex-Governor Connor could not transport a deer, killed honorably in open season, from Bangor to Augusta last fall. Commissioner Stillwell, when applied to, said: "Governor, I can do nothing for you under the law." Governor Connor yielded willingly, like the true gentleman he is, and took his deer to Augusta by private conveyance. This was under the first enforcement of the new transportation law in that State, which few at that time understood. Even Senator George F. Hoar came near having to pay the fine for killing a moose in that State a year or more ago, since he happened to be in the party which did kill one, but he was able to show that he was not present at the time. One of the Maine Commissioners remarked last summer that even President Arthur would be punished were such a thing possible that he be caught poaching in Maine. It is a mistake. Favor has not been shown to either honorable or dishonorable in the enforcement of the game laws in Maine. SPECIAL.

BOSTON, Mass., March 24.

Editor Forest and Stream:

The complaint of "C. G. G.," in your last issue, deserves a word. We like our laws, and the respect being shown for them by our own citizens is evidenced every day during close time, and our game—ruffed grouse in particular—have not been so plenty for years. Not only this, but if "C. G. G." comes into Maine for recreation, he must respect and obey them just the same.

There is one point, however, in which our own citizens have precedence, and if your correspondent had taken pains to inform himself he would not accuse Hon. H. Hamlin with breaking our laws. As he says, "It speaks for itself." I have such confidence in the gentleman he contemptuously names the "Great American Game Warden," that if "C. G. G." will apply for a copy of our game laws, I am sure that it will be forwarded to him. At the end of Section 48, it reads: "Provided, however, that during February, March and April, citizens of the State may fish for and take land-locked salmon, trout and togue, and convey the same to their own homes, but not otherwise."

Once in a while we meet just such croakers as "C. G. G." One in particular I have now in mind. He lives in one of the best localities for small game, and he and his boys have until within a few years had free scope to kill water fowl at any and all seasons. Finding game was diminishing in the beautiful bay in front of the homestead, he began to be very ardent in advocating law. Well, the laws have been made, and still he croaks. The Protective Association in his vicinity wished to make him warden. True, he would do great things if he was warden; but he could not be prevailed upon to accept the position. The truth to-day is just this: Make a law that shall forbid everybody else but himself and his boys firing a gun within a dozen miles of his favorite bay, and he'll go for it every time.

Give these gentlemen the unlimited run of our State, let them murder our moose, deer and caribou, trout and salmon, in season and out of season; send cheap guns into the State to give to the boys who will shoot ruffed grouse for Boston market, while budding in winter, and while the game lasts they will be suited, and not till then. N.

BATH, Me., March 24.

A PECULIAR FISH.

Editor Forest and Stream:

I see in your issue of March 13 a piece headed "A Peculiar Fish," and, as there has been much discussion as regards it, I want to add my mite. I have for years lived near and fished these waters, and think the description of the fish far from right. Last fall I obtained permission from the State Commissioners to take fifty of these fish for the purpose of stocking Stone Pond. I caught two distinct varieties of trout; one very light-colored, slim and silvery, the other, to all appearances, was a common brook trout, being dark, with very bright spots, and much the heavier in propertion to length, the same length of the latter weighing one-third more than the former. There is no stream, however small, flowing into this lake, as it is entirely fed by springs. Only the common brook trout are found in the outlet of this lake. The right to fish this lake is claimed on the ground that it is a lake, and the "strange fish" is a lake trout for this reason. It is called in the Dublin history Monadnock Lake, and also Monadnock Lake on the county maps. It is called by many here Dublin Pond. The question is, is it a lake or a pond, and what is the difference between a lake and a pond? Last fall both kinds of trout spawned on the same bed, but what I term brook trout were about fourteen days later than the others, and did not come until the others had left.

FISH WARDEN.

MARLBORO, N. H., March 17.

[The differences mentioned are not of themselves sufficient to establish two species. Shape and color amount to little or nothing in the salmon family. The fact of a trout inhabiting a lake does not make it a "lake trout." By lake trout is understood the fish called in different places togue, lunge, salmon trout, Mackinaw trout, etc. We cannot say that the fish in question is not a distinct species, but evidence from an ichthyologist is first needed to prove it. The ordinary angler is seldom competent to decide on species. Send specimen to the Smithsonian Institution and let us know their decision. A lake is a large pond and a pond is a small lake.]

NEW JERSEY NOTES.—A bill has passed the Assembly appropriating $500 for fishways over the Dundee dam on the Passaic. Shad and striped bass formerly ascended the river above the site of the present dam, and a fishway there would give the anglers of Paterson a chance to fish near home. The Paterson *Press* says: "Just at present fish are being murdered by wholesale, and it is a disgrace to the county that the present laws are not enforced. Nets are being drawn regularly above the falls and also between Paterson and Dundee dam in direct violation of the law. The offenders could be brought to justice without the slightest trouble if somebody would only take hold of the matter. Another illegal method of capturing fish is extensively resorted to at present. If a person will take a walk along the banks of the river during any night he will see hundreds of lanterns burning along the shores and men in boats moving about from place to place. All these men are violating the law and running the risk of being sent to prison. Pickerel and bass are spawning at present. They seek the shallow places along the shores, where they lie frequently in a semi-dormant condition. Men with spears take hundreds of these fish every night in the most unsportsmanlike manner, and in direct violation of the law, and that under the very eyes of the authorities. A sportsman's club is badly needed in this county. There is an organization calling itself the Paterson Rod and Gun Club, but it has been little heard from in the way of protecting of fish and game. If the illegal catching of fish at this time of the year could be stopped, and there is no reason why it should not, there is no reason why there should not be good fishing in the Passaic near Paterson throughout the open season."

TROUT IN NEW JERSEY.—During the past week three of our Philadelphia anglers, having the fever upon them, went to New Jersey, within fourteen miles of Philadelphia, and caught sixty trout. They were mostly fingerlings, four inches long; the largest certainly did not exceed six inches. Worm was the bait. New Jersey allows trout fishing in March. At the corner of Seventh and Sansom streets, Philadelphia, black bass, fresh caught, are displayed on a stand fronting a restaurant. This is a violation of the law surely. —HOMO.

THE STRANGE FISH IN CAYUGA LAKE.—In answer to "what fish is this?" from Cayuga Lake, I believe they are what is called "dog fish;" when grown they do not look like bullheads exactly, but when small look like trout. I could not tell the difference. In talking with different ones while fishing in that lake last summer they all expressed a belief that the fish had been put in the lake for trout.—E. F. K. (Auburn, N. Y., March 16).

RIPARIAN RIGHTS IN CANADA.—*Editor Forest and Stream:* Mr. S. G. W. Benjamin, in "The Cruise of the Alice May," in the March *Century*, states that the Canadian government controls and leases our trout streams, even to the exclusion of the owners of the adjoining banks. Holders under leases of the streams from the government did try to establish that view of the law, but it has since been decided by our highest courts that the government have no such power over the rights of riparian owners, and consequently those rights are now universally respected. Many sportsmen find it cheaper to buy a lot of land on the shore and fish as a riparian owner, than to lease from the government.—B. (New Brunswick, March 20, 1884).

Fishculture.

NON-HIBERNATING CARP.

Editor Forest and Stream:

I notice in your issue of yesterday the communication of a gentleman whose initials and location indicate that he is a prominent member of the American Carp Cultural Association, who is engaging in carp culture systematically, and who closely watches for new developments. Several other members have written or informed me orally of similar developments in their ponds. The first carp which I obtained from the Government (scale-covered) were placed in a small pond of clear water where I could observe their habits. As soon as the water approached the freezing point, early in December, they collected in the deepest point and commenced burrowing, head downward. As there was a heavy admixture of sand in the mud, it was three days before they entirely disappeared. The third day nothing but their tails were in sight. These were in constant and active motion as long as visible. They made their appearance again early in May. In the winter of 1882-3 they did not hibernate at all, for I could see them swimming near the bottom, even under four inches of ice.

The fact is, that the American carp is becoming a materially different fish from the European fish. It is not only losing its hibernating instincts, but it attains double the growth here in a given time, and is in other ways improving when intelligently bred. It appears to be quite certain that we have but one variety of pure food carp in this country, the progeny of which retains the true characteristics noted by reliable ichthyologists. I refer to the parti-scale type, termed by the Germans "leather," "mirror," "bluebacks," and probably other fancy and whimsical names yet to be heard from. Our scale carp are notoriously improved, their progeny developing well-known types of hybridity. The carp culturists of this region are killing off their scale stock. Most of my own stock is of this type, and knowing of its impurity, I refuse to sell any of it alive. I am making all practical efforts to breed an entirely scaleless type. MILTON P. PEIRCE,

Secretary American C. C. Association.

PHILADELPHIA, Pa., March 21, 1884.

FISHCULTURE AND FISHWAYS IN NOVA SCOTIA.—In the Canadian Parliament the Hon. L. G. Power, Senator from Nova Scotia, made a speech on the fisheries, etc., on Feb. 22. In general terms, he indorsed the letter of Hon. W. F. Whitcher to FOREST AND STREAM, which made so much stir when that gentleman, during his official term as Commissioner of Fisheries, claimed that the results of fishculture in the Dominion had been very small. He referred to the descriptions of the McDonald fishway in FOREST AND STREAM of Jan. 3 and 10, and suggested that an inquiry be made regarding it, and, if the results are satisfactory, recommends that some of them be constructed. He thinks if this is done the fecundity of fish is so great that they would probably replenish its rivers in a very short time. The Hon. Mr. Kaulbach agreed with Mr. Power, and thought the hatcheries were not placed far enough above tidal water. If this is the case it seems to us that it would pay to transport the fry to the upper streams. It must be that there is something in the methods which are faulty, as fishculture is successful in most places outside of Canada.

THE PROPOSED FISHWAY AT DUNDEE DAM.—The New Jersey Legislature has appropriated $500 for a fish ladder at Dundee Dam. The one sunfish left in the Passaic River by the polluters and the fishers out of season, who are not in the State prison, is expected to climb the ladder early in the season.—F. SATTERTHWAITE.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 26, 27 and 28.—The Dominion Kennel Club's Second Annual Bench Show, Horticultural Gardens. Charles Lincoln, Superintendent, W. S. Jackson, Hon. Secretary, Toronto, Canada.

April 3, 4 and 5.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio. Entries close March 24.

April 22.—The St. Louis Gun Club's Bench Show, St. Louis, Mo. Entries close April 14. J. M. Munson, Secretary.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1010.** Volume I., bound in cloth, sent postpaid, $1.50.

DISQUALIFICATION OF JILL AT CINCINNATI.

Editor Forest and Stream:

In your issue of to-day you give, under the head of awards at Cincinnati, the following: "Fox-terrier bitches, open class. Tip. Puppy class. Clover Belle." Now, if this is not an error, will you kindly inform me by what bench show rules, either in this country or in England, you reach such a conclusion? The facts in the case are simply these: We entered our 8½ months' bitch puppy Jill in both puppy and open classes. When the classes were judged she was awarded first in both. After the awards were made a protest was lodged against her as being infected with mange, and the protest was sustained by the Arbitration Committee. Rule 7 in the premium list of the show says that "a dog disqualified for mange, etc., shall forfeit any prize which may have been awarded to it." This clearly debars us from claiming the money premium. But Rule 9 says, "The decision of the judges shall be final, except for fraud," etc., and Rule 10 says, "No question involving the merits of a dog to receive a prize can come before the referees." Now, it is absurd to suppose a judge like Mr. Mortimer would

THE KNICKERBOCKER KENNEL CLUB'S LIVER AND WHITE TICKED POINTER DOG "KNICKERBOCKER."

Winner of Champion Prize at New Haven and Washington. 1884.

award first to a disqualified dog. As a matter of fact, Jill has no mange at all. She was confined to keep her clean and got too high in blood, which caused skin irritation, and a scar over her eye and one on her hip, won in a late battle, doubtless added to the examiner's impression of mange. The class was not rejudged that I have heard of, and I submit that, as far as the record goes, the judge's awards were final and our bitch is entitled to the place she won. Even if she had mange, it would not detract from her merits, and to shut her out the protest should have been lodged before, and not after, the judge's award. This is not my individual opinion, but that of a dozen breeders in this section, and if we are wrong we would like to know how and why. If right, we want the correction made in your published list of awards. SURREY.

ELLICOTT CITY, Md., March 13.

[The disqualification of Jill places her exactly where she was before she was judged, so far as the prize or honor is concerned, and the question of merit does not, therefore, enter into the case at all.]

NEW ENGLAND KENNEL CLUB.

A MEETING was held March 19, at the Parker House in Boston, for the purpose of founding a new kennel club. The history of the movement is somewhat as follows: Dishonest dog dealers have imposed on breeders to a certain extent, by putting upon the public many dogs of impure blood, thereby injuring honest breeders; attempts have been also made to pass laws against the keeping of dogs, and believing that much good could be done toward remedying these and other evils, a number of gentlemen came together on the 22d of February at the Parker House, to consider the subject of forming the new club. After much discussion of matters relating to the breeding, showing, sale and pedigrees of dogs, it was unanimously voted to form a club, having for its objects the interest of all honest breeders and lovers of dogs, to make breeding on a par with any other business or calling, so that any gentleman might with dignity acknowledge himself a breeder. With these ideas in view, a committee was chosen to draw up a constitution, and at the meeting on the 19th inst., the "New England Kennel Club" was organized, and the constitution adopted. The objects of this club as provided for in its constitution are: To encourage the breeding and importation of thoroughbred dogs, to hold bench shows; also, to hold meetings for scientific and theoretic discussions, and the reading of essays on the subjects of breeding, to use every means within its power to protect breeders of stock having authentic pedigree, to influence the passage of just laws relative to and generally protective of dogs.

The officers of this club are: President, Arthur W. Pope, of Boston; Vice-President, Charles E. Shaw, of River Side Kennel, Clinton, Mass.; Secretary and Treasurer, J. A. Nickerson, of Boston. There is an Executive Committee of five, consisting of the President, Secretary and Treasurer and three members of the club, whose names are Dr. Frank S. Billings, V. S.; Jean Grosvenor, Shamrock Kennel, Boston, and J. Dobson, of Hyde Park, Mass. There is also a Finance Committee of three—Dr. J. Frank Perry, Ashmont Kennels, Dorchester, Mass.; C. H. Baker and Edward S. Payson, of Boston. The membership is unlimited as to numbers, and unrestricted as to residence of members. There are two classes of members—an active and an associate class. Both have the same privileges, except that none but active members will vote, or have any voice in the business of the club. The annual fees are, for active members, $10, and for associate members, $5, payable in advance. Blank applications for membership will be furnished by the Secretary on application. The annual meeting of the club will be held on the first Saturday of March in each year, but probably monthly meetings will be held also. The next meeting of the club will be held April 16, when all matters of interest to the public will be published in FOREST AND STREAM. Persons desiring to communicate with the club may address P. O. Box 2,574, Boston, Mass.

EASTERN FIELD TRIALS CLUB.

MEMBERS Take Notice.—On April 8, 1884, there will be a quarterly meeting of all the members of the club in conjunction with the Board of Governors.

WASHINGTON A. COSTER, Sec. and Treas.

CHAMPION KNICKERBOCKER.

WE give this week a cut of the large pointer Knickerbocker, winner of first, Boston, 1882; champion at Ottawa, Ont., and champion at both New Haven and Washington, 1884. He is by Glenmark (Rush—Romp) and out of Girl (Maryland—Till).

ROBINS ISLAND CLUB.

THE annual meeting of the Robins Island Club, March 17. The following list of officers were elected for the ensuing year:

PRESIDENT.
Dr. S. Fleet Speir.

VICE-PRESIDENT.
Mr. W. B. Dickerman.

SECRETARY AND TREASURER.
Mr. A. F. Plummer.

BOARD OF DIRECTORS.

Dr. S. Fleet Speir,	W. B. Dickerman,
A. T. Plummer,	W. B. Kendall,
Henry J. Cullen,	H. D. Polhemus,

A. S. Swan.

By unanimous vote of the club a vote of thanks was tendered to the retiring president, Mr. Wm. B. Kendall, for the very able and satisfactory manner in which he has administered the affairs of the club during the past year. The club is in a very prosperous condition, the treasurer's report showing a handsome balance on hand. $1,000 was appropriated for improvements the coming year. Much interest was manifest in the annual field trials of the club to be run next fall, and no effort will be spared to make them first class in every respect.

FOX SHOOTING AND FOX HUNTING.

Editor Forest and Stream:

It is probably hardly worth while to "let fall any word of extenuation from the pallid lips of the man who has shot a fox;" it would avail nothing with the man who thinks the only proper way to kill a fox is to worry the poor outlaw to death with a pack of hounds that give him not more than the ghost of a chance for his life. But then, we are all wedded to our idols and each to the sport he loves, and we all have little enough charity for the worship or the sport of others.

There is an element of cruelty, a strong leaven of the old savage Adam in all field sports, so much of it that every one who recreates himself with rod or gun or hound, must cry out at certain times when his heart is tender and the fire of the chase not burning within him, "God be more merciful to me than I have been to His creatures that He has set before me!" There is only one feature in field sports to redeem them from the charge of wanton cruelty, and that is fair play. Now, wherein does the shooting of foxes before one or two hounds lack this quality more than running them down with a dozen or more hounds followed by men on horseback? A man may get his neck broken, or a horse his knees, but that does not help poor reynard's case at all, for the hounds go bellowing after him just as if nothing had happened.

Wherein is there less of fair play to shoot a fox before hounds than to shoot a hare or a deer in like manner? And as for the skill required in each case, either as marksman or woodsman, any one who has tried the three knows which calls for most. If one will stand still long enough almost anywhere in the woods when dogs are running a hare, he may get a shot, and if long enough on a runway a shot at a deer, no matter how little he knows of the habits of the game. But he who hunts foxes on foot successfully must have much more of woodcraft and some knowledge of the manners and customs of the wiliest animal that ranges the woods, and he must be as much a man physically as he who goes a hunting on a horse's legs instead of his own, for he must endure long and hard tramps.

As for riding to the hounds, it is a very fine and noble thing to do, and I have read that the young men at Newport do it very well in the exciting chase of the anise-seed bag or the hobbled fox, and would doubtless die supremely happy if they broke their necks in the sport, if by so dying they could ape Englishmen as closely as they do in dress and speech and other matters of living.

This is the gist of it: It is un-English to shoot foxes, therefore it is unsportsmanlike. It is humiliating to think that any American, North or South, should care a snap of his fingers now for British opinion of anything concerning us. Are we not old enough and strong enough to have ways of our own and sports of our own, without regard to what others think of them? The nature of our country and the temper of our farmers alike forbid the hunting of foxes here in English or Southern fashion, and the Newport style of hunting is not likely to come into general favor yet throughout New England. Let us continue to hunt our foxes in our own way, and if beagles are "deadly" and staunch and musical, let us have them by all means.

My lips are not pallid when I say that I had good sport in shooting half a dozen foxes last fall, and that I hope to have many another day of such goodly sport in the brown, autumnal woods of my beloved New England. AWAHSOOSE.

FERRISBURGH, March 12.

N. A. K. C. DERBY.

Editor Forest and Stream:

In inclose additional list of entries for the Fifth Annual Derby, National American Kennel Club, received up to date. I have received a great many applications for entry blanks, and think the entry will be large. P. BRYSON, Sec.

MEMPHIS, Tenn., March 21.

ENTRIES.

JIM BLEDSOE.—Major J. W. Renfroe, Atlanta, Ga., black, white and tan English setter dog, Dec. 3 (Baden Baden—Daisy Royal).

PAUL JONES.—Major J. W. Renfroe, Atlanta, Ga., black, white and tan English setter dog, Dec. 3 (Baden Baden—Daisy Royal).

GEM.—Dr. J. N. Maclin, Keeting, Tenn., lemon and white English setter bitch, April 16 (Gladstone—Gazelle).

NABOB.—E. F. Stoddard, Dayton, O., liver and white pointer dog, Feb. 17 (Croxteth—Trinket).

DANDY BOB.—E. F. Stoddard, Dayton, Ohio, liver and white pointer dog, Feb. 17 (Croxteth—Trinket).

DAYTON.—E. F. Stoddard, Dayton, Ohio, liver and white pointer bitch, Feb. 17 (Croxteth—Trinket.

FRANK S.—F. I. Stone, Chattanooga, Tenn., blue belton English setter dog, May 31 (Gladstone—Zell).

GLAD S.—F. I. Stone, Chattanooga, Tenn., blue belton English setter dog, May 31 (Gladstone—Zell.

TANGIPAHOE.—H. Fontaine, Magnolia, Miss., black, white and tan English setter bitch, April 21 (Gladstone—Flossy).

JO JO GLADSTONE.—E. S. Bond, Chicago, Ill., black, white and tan English setter bitch, July 10 (Gladstone—Lavalette).

COUNTESS SPEED.—J. Hayward, Jr., St. Joseph, Mo., lemon and white English setter bitch, April 16 (Gladstone—Gazelle).

MABLE.—J. Hayward, Jr., St. Joseph, Mo., black and white English setter bitch, May 18 (Dash III.—Jessie).

ALFRED.—J. Hayward, Jr., St. Joseph, Mo., black and white English setter dog, May 18 (Dash III.—Jessie).

BABY MINE.—J. Hayward, Jr., St. Joseph, Mo., lemon and white English setter bitch, July 18 (Rake—Madam Llewellin).

GLADROY.—Whyte Bedford, Horn Lake, Miss., black, white and tan English setter dog, June 28 (Gladstone—Donna J.).

LOTTA.—W. B. Gates, Memphis. Tenn., black, white and tan English setter bitch, Aug. 19 (Count Rapier—Juno).

PEGMATITE.—Dr. N. Rowe, Chicago, Ill., black, white and tan English setter dog, April 11 (Cambridge—Marchioness Peg).

PEGOMANCY.—Dr. N. Rowe, Chicago, Ill., black, white and tan English setter bitch, April 11 (Cambridge—Marchioness Peg).

GILDIE.—W. W. Titus, Cherry Creek, Miss., lemon and white English setter bitch, July 23 (Count Rake—Minnie).

CARRIE H.—W. W. Titus, Cherry Creek, Miss., blue belton English setter bitch, June 3 (Roy—Gretchen).

JAMESTOWN.—W. W. Titus, Cherry Creek, Miss., black, white and tan English setter dog, May 7 (Count Noser—Lola).

NEW YORK DOG SHOW.

IN answer to inquiries the managers of the Westminster Kennel Club desire to state that dogs will be classified according to their record on date of entry. A first prize winner in an open class at Cleveland or Toronto, therefore, may compete in open class at New York, provided he was entered at New York prior to receiving the award at Cleveland or Toronto. Should entry be made after the award at the last named shows, he must be entered in the champion class.

Winners at Cincinnati are barred from open classes at New York. There have already been a large number of valuable special prizes offered which we will notice more at length next week. The club have made a new departure in the inauguration of a sweepstake for English setters, Irish setters, large pointers and small pointers. The entrance will be $10. The winner in each of the four classes to receive all of the entrance money and a piece of plate, added by the club. The winner to be known as the champion dog of America. The club to be permitted to compete. Entries in each of the sweepstakes to be made on or before the 21st day of April next.

In addition to the list of judges already published, Mr. E. C. Sterling, of St. Louis, Mo., will judge the pointers.

THE WASHINGTON DOG SHOW.

THE second international bench show, under the superintendency of Mr. Chas. Lincoln, was held at Washington, on the 18th, 19th, 20th and 21st inst. Owing to the uncertainty of securing a suitable building, only a short notice was given to exhibitors, but they at once rallied to the front, and a really good show was held. The attendance was very good, and included the President and many members of his cabinet, Secretaries Folger and Lincoln, Senators Bayard, Beck, Palmer, McKenna, and Hon. H. H. Riddleberger. The ladies also showed the lively interest they took in our faithful dumb companions, and forced us to the conclusion that Washington was pre-eminently the place for a successful bench show. The judges selected were as follows, viz.: For English setters and pointers, Hon. Jno. S. Wise, Richmond, Va., and Major J. M. Taylor, Lexington, Ky.; for Irish and Gordon setters, Major J. M. Taylor; for mastiffs, St. Bernards, spaniels, deerhounds and greyhounds, and all other non-sporting classes, Mr. Jas. Mortimer, N. Y. There were few complaints, and the judging, with a few exceptions, gave general satisfaction.

The entries in the big dog classes did not fill so well as might have been expected.

MASTIFFS.

There was only one mastiff, Dido, a tolerably well put together bitch, but altogether too small. She was awarded second prize.

ST. BERNARDS.

Only one St. Bernard faced the judge, a moderate, but fair coated bitch, with badly shaped skull. She was awarded the prize.

NEWFOUNDLANDS

Brought out three entries, of which Major was first, Lion hc. and Dido c. Neither of these deserve especial mention.

DEERHOUNDS.

Mr. Thayer's entries were all absentees, as was also the Clovernook Kennel's Roy, but the magnificent entries of Mrs. S. F. Emmons more than made up for their non-appearance. Three finer specimens we have never seen. They were well placed, Robin first, Brian second, Bruce vhc.

GREYHOUNDS.

The Cincinnati winner, Major, was an easy first; Snyder second, is good on head and body, but inclined to be coarse and rather strong in tail; Dorothée vhc., is beginning to show age; Buff c., a seven months' old puppy, is coarse.

SETTERS.

In champion English setters, dogs, Plantagenet, looking in good shape and condition, beat Cossack, who has lost the coat and feather he was so beautifully supplied with last year. In the bitch class, Dashing Belle easily won over Fairy II., who shows age. The open dog class, except pure Laveracks, was a large class, made up mostly of local dogs, and not up to the standard. All prizes were withheld, Rocket getting vhc. reserve, and Goodsell Kennel's Racket vhc., and Duke c. In the bitch class, Dashing Jessie was awarded first prize, Victoria second, Ophelia vhc., Bluebell hc. We liked Bluebell for second place, as she is a good mover, and with the exception of standing a trifle high behind, there is but little fault to be found with her.

In English setters, dogs of pure Laverack pedigree, Goodsell Kennel's Prince easily beat Bob White, who was shown very much too low in condition. In the bitch class, Petrel III. beat her kennel companions, Queen Petrel, second prize, and Daisy Laverack vhc. The dog puppies lacked quality, and all awards were withheld. Hilarity, a nicely-shaped puppy by Cossack—Ophelia getting an hc. The others were unnoticed, although we liked Alert, a litter brother to Hilarity. There were only two entries in the bitch class, of which Countess took first prize and Cassandra second. We could scarcely see the consistency of the judges in giving first and second prizes in the bitch and withholding all awards in the dog class, as the quality certainly was no better in this than the preceding class.

In champion Gordon setters Lady Gordon had a walk over. The open class for dogs was a very poor class, Ned getting first and Gem second. There were no other awards, although we thought Luke, in this company, might have got a mention. The bitches were a wretched lot, Fannie, hc., was the only one worthy of a card. In the puppy class first was awarded to Don, the only entry.

In champion Irish setter dogs, Glencho, in magnificent shape, had things all to himself. He scarcely needs description, so well known is he, and but for being a trifle weak behind, we think him simply perfection. Trix easily beat Clara Belle in the bitch class, being very superior in head and in that high bred appearance which distinguishes the Irish setter.

In the open dog class Glenmar, a six months old puppy, by champion Glencho, easily disposed of his rivals. He is a wonderfully well made and developed puppy and with good luck we predict a successful future for this gamy-looking youngster. Keys was awarded second prize; he is of good color with a nice coat but a coarse skull. Rob, vhc., Pilot c. We thought Elcho IV. as good as Rob and better than Pilot, but he failed to catch the judge's eye. In the bitch class Reeta, a very fair bitch with a nice head, good shoulders and coat, beat Ada, second, who is a good all round bitch, but is too small. Liffey, hc., and Blarney, c., are moderate specimens. In the puppy class Glenmar had things to himself. Kate Mackey, a very promising bitch, second; Walter, vhc.

POINTERS.

In champion pointers over 55lbs., the Knickerbocker Kennel Club's Knickerbocker was the only entry and was awarded the blue ribbon. The under 55lbs. class was divided into dogs and bitches. Bravo, looking very well, was first in dogs, and Dutchess beat Lassie in bitches. The open dog class over 55lbs., introduced some of the best looking large dogs we have seen for a long time. Guy, a well made lemon and white-ticked, of fine size, but a little coarse in head, and a trifle throaty, beat Fritz, a litter brother, who was placed second. Pilot, vhc., Cary, hc., and Tim, hc., were all very much above the average. We thought Fritz almost the best in the class, for though smaller than Guy, he shows more quality; Pilot has very few faults, but is rather weak in loin. Of the others, we liked Tim, hc., better than Cary, hc., who is heavy in skull with not the best of shoulders. The class, however, was an exceptionally good one. In the bitch class, Fanny was awarded second prize, all other awards and commendations being withheld.

In the dog class, under 55lbs., Tom Peter beat Match. There was not much between them. The winner is a light-bodied, leggy dog, but with good style, while Match is handicapped by his bad eyes. In the bitch class Lyde, a nearly black bitch, with rather a poor head but good shoulders, chest, legs and feet, was first. Polly, who was second, has a good head and body, but is somewhat out at elbow and wide-chested. She refused to show herself in the ring. Lena, hc., is a leggy, light-boned bitch, with good head. Moonstone was absent. This was not a good class. In the puppy class Lon, awarded first prize, shows a good deal of quality, but is light in bone and has none the best of feet. Daisy Bravo we liked quite as well as the winner, and Lady Mac, vhc., we thought better than either, but she is a trifle plain-faced, tight-lipped and her ears set rather high. Dandy Bravo is also a very promising puppy, but is a bit coarse in head.

Chesapeake Bay dogs brought two entries, one of which, Jeff, got loose and was not again captured. The other, Ches, consequently had a walk over.

SPANIELS.

In champion field spaniels, over 28lbs., Black Prince, the only entry, was absent. The Hornell Spaniel Club were the only entries in all the classes except one, in which Mr. Pierce exhibited a very nice little white and black bitch; she was awarded second prize, Rattler taking first, beating her in head and bone.

FOXHOUNDS

brought out two good ones. St. Burnea having the best set of legs and feet, back and loin, beat Gainer, who excelled in head properties, but was weak in loin.

BEAGLES

were a poor class, and placed Bessie, first; Bonnie Lass, second; Maggie, c.

DACHSHUNDE.

There was only one dachshund, Waldmann K., a nice black and tan, he was awarded the prize.

FOX-TERRIERS.

In champion fox-terrier dogs, Lancelot, in poor coat, was alone. He has good bone, nicely marked, but rather thick head, and stands a trifle high. In the bitch class, Lyra, the only entry, was absent. In the open dog class, Surrey Kennel's Flippant, shown in bad condition, was first. He has a fair coat and good bone. He is rather coarse in head, but is a useful sort. Tasman, second, has a thick skull, and is long-backed, wide in front, and has open feet. In the bitch class, Mr. Thayer's Jaunty, the only entry, was absent. In the puppy class, Belvoir Jack was the only candidate, and he had to put up with barren honors, receiving a vhc. He is a useful-looking puppy, but has a bad head, and is too high on his legs.

COLLIES.

In the champion class Robin Adair quite outclassed Rex, who was shown, "as were all Mr. Lindsay's entries," hog-fat. He is also in bad coat. In the bitch class Zulu Princess won over Jersey Lass, a plain looking bitch, but good-coated. Effie and Meg were both absent. Hiram was first in the open dog class, he is a large dog with good coat. He beat Tweed IV., a dog with a good deal of character, but inclined to be curly and soft in coat. Bruno, vhc., had nothing much to recommend him, being too thick in skull. He is, however, a very nicely marked black and tan, and is in fair coat. In the bitches class Fairy, a nice-moving bitch with good coat, but rather bad ears, beat Lilac, who is better on head and ears, but lacks coat. Doty, vhc., is a nice bitch, good in coat and color, but a trifle undersized. The puppy class brought out three good ones, with but little to choose between them. Nannie O., the best in color and coat, was placed first; Sandy, a nasty color, but profuse in coat, was second; and Donald vhc.

BULLDOGS.

The entries in the champion dog class were all absent. In the bitch class, R. & W. Livingston's Sweet Briar was the only entry. She is a good bitch, and was awarded the prize. There was only one entry in the open dog class, Major, who had to be content with second prize. He is small and narrow in skull, and long and pinched in face.

BULL-TERRIERS.

Grand Duke, a fine large dog, beat his kennel companion Little Maggie, a very nice little bitch, rather coarse in tail and with a large eye.

BLACK AND TAN TERRIERS.

Brilliant first, beat Vortigern, second, who shows age and is very wide in front, too light in tan, deficient in markings, and has lost his teeth. Daisy, hc., would have done better in the toy class.

DANDIE DINMONTS.

Dan was the only Dandie Dinmont in the class for these useful terriers. He is a good one.

IRISH TERRIERS.

Jessie, the only entry, is thick-headed and lacks coat.

CHAMPION SKYE TERRIERS

Brought out Mr. W. P. Sanderson's strong team, Jim and Suter Johnny; these are both extraordinarily good specimens. Jim beating Suter Johnny in color of coat, head and bone. In the open class Mr. Sanderson was again successful, with Robert Burns, a very nice young dog with good length of body and close to the ground, with the right coat. Mary Corning, second, is a good bitch. Marquis, vhc., has a badly-carried tail, and is rather high on legs. He is a good dog but shows age. Wallace, hc., is weak-jawed and snipy, and soft in coat.

ANY OTHER VARIETY OF TERRIER

Brought out an Airedale, showing almost too much otter hound and too little of the terrier. He was placed first; Buster, a Bedlington terrier, was second, and Remus and Marcus each vhc.

YORKSHIRE TERRIERS.

Puck, in grand coat, beat Eddie in coat and color.

ITALIAN GREYHOUNDS

Had only one entry, which was awarded the prize.

PUGS.

Champion pugs brought out Mrs. Pue's champion George, who was on exhibition only. Joe therefore had a walk over These are both very choice specimens, Joe being about the right size. In the open class for dogs Mrs. Chas. Wheatleigh's handsome little dog Tu Tu was first. He has a very good skull and good wrinkle, but is a little tucked up in body, rather weak in hindquarters, and has a large ear. Puggie, second, is a good-shaped dog, but is very smutty in color. Don Juan, vhc., we were disappointed with. He won second at this show last year, but seems to have grown plain. Punch, vhc., is a well-made dog, with a good head, but is too large. Joe is a puppy, too close to the ground, and rather crooked in front. In the bitch class, Chloe, a very nice bitch, good in head, was placed first. Judy, an overfed little daughter of champion George, was second. Victoria, vhc., a beautifully colored little bitch, we thought should have been second. Witchie, c., has grown gray in muzzle and ears, and is altogether too fat.

TOY TERRIERS

Under 7lbs. were a nice collection. Bijou, the winner, is a very pretty black and tan. Dot, the nicest of the lot, was overweight and, therefore, disqualified. The others were all good specimens.

KING CHARLES OR BLENHEIMS.

Mrs. Senator T. W. Palmer exhibited two very handsome Blenheims, which, we understood, had been successful at bench shows in England. Duke, placed first, had the best skull and shortest face, while Duchess, second, was in better coat and had the spot in forehead so desirable in this breed. They are certainly the best looking pair we have seen.

MISCELLANEOUS OR FOREIGN CLASS OVER 25LBS.

First prize was awarded to Minka, second to Cæsar, vhc. to Jack—all Siberian or Ulmer dogs.

Same class under 25lbs.—First and second to Mex and Nellie, Mexican hairless dogs; vhc. to Tony.

Following is a list of the

AWARDS.

Classes 1 and 1A.—No entries.
Class 1B.—1st, withheld; 2d, H. T. Janney, gray, 5yrs., Jack—Dido.
Classes 3 and 4.—No entries.

G.—For best pointer got by Faust or Beaufort, C. B. Wildman's Guy.

H.—For best setter owned in Washington, Miss M. L. Roessle's Cossack, English setter, white and orange, 4yrs. 10mos., Don—Fairy.

I.—For best pointer sired by Beaufort, C. B. Wildman's Guy.

ST. LOUIS DOG SHOW.

Editor Forest and Stream:

The St. Louis bench show will be held April 15, 16 and 17. Exhibitors at Cleveland will have ten days' rest for their dogs, and ample time before going to New York. The premium list is in the printer's hands, and will be mailed as soon as finished. A supply will be sent to you for those who may apply to you for them.

Champion pointers and setters, dogs and bitches, get $25 each. Open classes, the same, get first, second and third prizes—$20, $10 and $5. All other classes in the show, except champions, get first, second and third prizes. The specials, as usual in St. Louis, will be very handsome and worth winning. Three prizes will be given to Chesapeake dogs, and as a very marked demand for these dogs has arisen here lately the show will prove a fine market for them, and should attract some good entries from the East. Spotted coach dogs are to have a class, in order to interest local owners. This city is full of them. The cockers are to be divided into the International Club standard and the American Club standard, and three prizes given to each. Dr. Franklin, the secretary of the International Club, promises a handsome special for dogs of his club's standard, and a meeting of his club will be called here during the show. The judges will be announced at the earliest possible moment. J. W. MUNSON.

ST. LOUIS, March 17.

Editor Forest and Stream:

From unavoidable causes the dog show has been postponed till April 22. Entries close April 14. Prize lists and entry blanks are now ready. The superintendent's address is, care of Albright's gun store, 313 North Third street. I send you a package of premium lists and entry blanks by express to-day, which you can distribute to such persons as may apply to you for them. Major Taylor will judge setters and pointers. The judge for the other classes has not been secured yet.

The Natatorium building on Nineteenth and Pine streets, where the show is to be held, is one of the best for the purpose in America. It will hold a thousand dogs easily. It is steam-heated and electric-lighted. The judging will be done in an inclosed square in the center of the hall. Several large open lots surround the building, where dogs can be exercised.

Large tanks and tubs, with hot and cold water are in the building, for washing dogs. Dog biscuits and cooked food will be supplied. There are first, second and third prizes in nearly all the classes, which it is expected will induce a number of entries from owners who don't think their dogs can win first.

The list of specials will be sent you from time to time as they are secured. A committee of the club will start out at once to get them.

The champion classes for setters and pointers include the winners of a first prize at any bench show in America.

J. W. MUNSON.

ST. LOUIS, Mo., March 22.

CLOVER BELLE.

Editor Forest and Stream:

Allow me to correct through the medium of your paper an unintentional deceit on my part in entering the pedigree of my fox-terrier puppy Clover Belle at both Cincinnati and New Haven as being Akely Joe—Guilty, whereas she is a puppy I bought at the late Rutherford sale, and is pedigreed Joker—Warren Daisy, or Bessie, I have been as yet unable to ascertain which of these latter.

The mistake came about thuswise:

The puppy on being bought was at once sent out of town to my kennels at Scarsdale, Westchester, N. Y., together with a sister bought at the same time. A week later there were consigned to me from England two fox-terrier puppies, a dog and a bitch, which had been purchased by me from Mr. G. Raper. The former was by his champion Raby Tyrant out of champion Richmond Olive, now the property of Messrs. Thayer & Bro. The latter, by Akely Joe out of Guilty, she by Corinthian. I had the misfortune to lose the dog on the voyage. My kennel man met the steamer on her arrival and brought the remaining puppy to me for inspection. I looked her over and found her to all appearances a promising one. She was then sent to the kennels.

When the Cincinnati show was announced, I made entry of her in the puppy class, and the day I left for Cincinnati entered her for New Haven. She took first prize at both shows. Saturday morning, my kennel man came in from the country to meet the dogs coming back from New Haven, and then it was that I learnt that as the puppy I had ordered to go to Cincinnati was out of condition, he had substituted this one and had not found opportunity of telling me of it.

I have entered the same puppy at Washington, but under her proper pedigree.

Hoping that this note will rectify any erroneous information current concerning her and wishing "honor to whom honor is due," I remain, EDWARD KELLY.

CLOVERNOOK KENNEL, 185 Fifth avenue, N. Y. City.

CHAMPION VIXEN.—We have learned that Mr. Mortimer, in awarding champion honors to the fox-terrier Vixen, did so at the request of the managers of the show. We are pleased to set the matter straight and place the blame where it belongs, and sincerely hope that we shall not be called upon to record another instance of the kind. Bench show honors, especially champion honors, should only be conferred upon animals that are worthy, else the sole object for which bench shows were instituted is perverted. No fear of incurring the displeasure of the disappointed exhibitor should induce judge or committee to depart from this rule.

STRAY DOG.—*Editor Forest and Stream:* A dog has been offered to me by a person who found it in the water off Port Morris, N. Y., as nearly as I can find out about two years ago. He said he thought it had jumped off of some Sound steamboat. As I would like to see the dog restored to its owner, he may communicate through FOREST AND STREAM, should he happen to see this, giving a minute description of the dog. It is said that some time after the dog was found a gentleman made inquiries at Port Morris.—SEAGULL.

PEDIGREE OF GLEN II.—Brooklyn, March 20, 1884.—*Editor Forest and Stream:* I would like to correct the pedigree of Clayton H. Redfield's Glen II., winner of first at New Haven. It reads Dr. Aten's Glen and Dr. Aten's Belle. It should read Dr. Aten's Glen and Dr. Aten's Madge.—H. F. ATEN.

CLEVELAND DOG SHOW.—*Special Dispatch to Forest and Stream.*—Cleveland, Ohio, March 24.—Please announce that all railroads will carry dogs free to and from the show when accompanied by owner or handler.—C. M. MUNHALL, Secretary.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Lady Bess. By Mr. E. B. Nichols, Dedham, Mass., for black, tan and white collie bitch, whelped Aug. 11, 1880 (Shep—Hornpipe).

Brunhild. The Chequasset Kennel's (Lancaster, Mass.) smooth-coated St. Bernard bitch Brunhild (A.K.R. 28), March 18, seven (four dogs), by the Forest City Kennel's Cæsar (A.K.R. 22).

Jersey Gyp. Mr. W. E. Rea's (Hackettstown, N. J.) English setter bitch Jersey Gyp (A.K.R. 107), March 3, five (four dogs), by Mr. C. N. Wade's Primer (A.K.R. 227).

Flora. Mr. A. D. Wilbur's (Catskill, N. Y.) cocker spaniel bitch Flora, March 17, seven (four dogs), by Mr. J. W. Rushforth's Chance; one dog since dead.

SALES.

☞ *See instructions at head of this column.*

Jock. Black, white and tan collie dog, whelped November, 1883 (Talisman—Iona), by the Kilmarnock Kennel, Mattapan, Mass., to Mr. Geo. A. Munroe, Somerville, Mass.

Avis. St. Bernard bitch (A.K.R. 929), by the Essex Kennel, Andover, Mass., to the Forest City Kennel, Portland, Me.

Lotta. St. Bernard bitch (A.K.R. 933) by the Essex Kennel, Andover, Mass., to the Forest City Kennel, Portland, Me.

Jude. Liver and white pointer bitch, whelped Sept. 26, 1883 (St. John—Folly), by Mr. J. H. Phelan, Jersey City, N. J., to Mr. George H. Piercey, same place.

Deacon. Red Irish setter dog, whelped Feb. 19, 1882 (Ned Elcho—Bridget O'More), by Mr. C. W. Feickert, New York, to Mr. Walter L. Hunter, same place.

Nellie. Red Irish setter bitch, age and pedigree not given, by Mr. C. W. Feickert, New York, to Mr. Walter L. Hunter, same place.

Craft. Lemon and white pointer dog, whelped Oct. 21, 1881 (Bang—Jean), by Mr. W. R. Stone, Atalissa, Ia., to Mr. Mortimer Mills, Jersey City, N. J.

Mab. Black pointer bitch, 3yrs. (Pete—Mab), by Mrs. Dr. Martin, Bridgeport, Ct., to Mr. Wm. Hepsley, Jersey City, N. J.

Stocking—Mab whelps. Black pointers, one dog and three bitches, 2mos. old, by Mrs. Dr. Martin, Bridgeport, Ct., to Mr. Wm. Hepsley, Jersey City, N. J.

Zantippe. Lemon belton English setter bitch, whelped Jan. 29, 1880 (Lotty—Maud Muller), by Mr. Henry Sturtevant, Medina, N. Y., to Mr. Thos. F. Connelly, Flatbush, L. I.

Lit Laverack. Black, white and tan English setter bitch, whelped Dec. 28, 1883 (Tempest—Lilly), by Mr. A. J. Ward, Boston, Mass., to Mr. Thos. F. Connelly, Flatbush, L. I.

Folko. Rough-coated St. Bernard dog (A.K.R. 477), by Mr. A. A. Whittemore, New York, to the Chequasset Kennel, Lancaster, Mass.

Janet. Black, tan and white Scotch collie bitch, whelped Feb. 9 (Prince—Lady Bess), by Mr. E. B. Nichols, Dedham, Mass., to Mr. C. C. Nichols, Walnut Hill, Mass.

Sir Gibbe. Sable Scotch collie dog, whelped Feb. 9 (Prince—Lady Bess), by Mr. E. B. Nichols, Dedham, Mass., to Mr. J. H. Gilman Cambridge, Mass.

Jean. Sable Scotch collie bitch, whelped Feb. 9 (Prince—Lady Bess), by Mr. E. B. Nichols, Dedham, Mass., to Mr. T. S. Beaumont, Fall River, Mass.

Gwenn. St. Bernard bitch (A.K.R. 932), by the Essex Kennel, Andover, Mass., to the Forest City Kennel, Portland, Me.

DEATHS.

☞ *See instructions at head of this column.*

Black Venus. Black spaniel bitch (A.K.R. 300), owned by Mr. A. C. Wilmerding, New York, March 18, in parturition.

Gypsey Queen. Liver and white pointer bitch, age not given (champion Faust—Munson's Queen), owned by Mr. Edward Odell, New Orleans, La.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

G. H., Canal Fulton, Ohio.—Try Glover's mange cure.

AL, Gravenhurst, Ont.—See answer to "F. P. C.," March 13.

L. E. R., Essexville, Mich.—It is impossible to say what caused the death of your dog. You describe no symptoms that throw any light upon the subject.

AMATEUR, Wortendyke, N. J.—1. Bathe the sore with one part sulphurous acid to three parts water. 2. Twice a day is often enough to feed him. 3. Yes.

C. B. M., Wilkesbarre, Pa.—Give a little lime water in milk with each meal, and a teaspoonful of cod liver oil three times daily. Give plenty of exercise, but not until after his food has had time to digest.

NIGHT HAWK, Concord, N. H.—The dog has canker in the ear. Take bromo chloralum and laudanum, equal parts, and dilute with six times their bulk of water; fill the ear and gently knead the base for a short time. One or two applications should effect a cure.

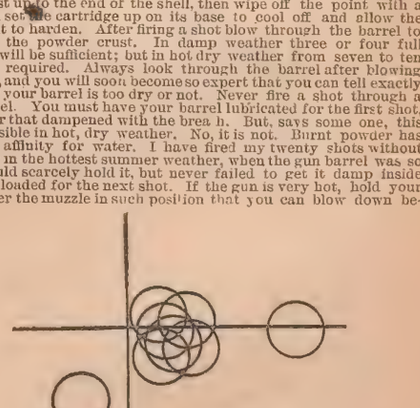
First International Clay-Pigeon Tournament, at Chicago, Ill., May 26 to 31. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.



NON-CLEANING SCORES.

Editor Forest and Stream:

In reply to the communication of Philip Uhler, of Mechanicsburg, Pa., in a recent issue, permit me to say that I experience no difficulty in regard to the bullets dropping after firing a few shots without cleaning. Neither do I consider it absolutely necessary to use a lubricating disc between the powder and bullet. I inclose a diagram of a target I made on the ninth of March, 1883. It is forty consecutive shots in a 4-inch bullseye, using fixed ammunition and naked bullets, and the rifle was not cleaned during the shooting. The distance was 100yds., weather clear and dry, and the shooting was done in the back position, no rest being used. After the shooting was over I took the rifle home, and after blowing my breath through the barrel two or three times, I passed a dry swab, composed of a cotton rag, once through the barrel, and it was as bright as a silver dollar from breech to muzzle. This is not an exceptional circumstance, as it is only once out of several dozen times that I took the same gun out and shot it at 100yds. during last spring and summer, never firing less than twenty shots at a time, and never taking a cleaning rod to the range, excepting on one occasion, and on that occasion I made my worst record for the season, making an average of about an inch and three-quarters per shot. I do not attribute the bad shooting on this occasion to cleaning the gun, but to other circumstances which need not be mentioned here.

I consider forty shots without cleaning a severe test of any breech-loading rifle, and as my experience in regard to accuracy has been so very different from that of Mr. Uhler, I will tell him how I manage my gun. I use a Maynard .40-cal., 32in. rifle, weighing 9lbs. I load the shells with 60grs. of Hazard FG powder, and a bullet known as No. 2 cylindrical. The bullet weighs a little less than 200grs. I make them myself with moulds furnished by the manufacturers of the gun, and use one part tin and twenty of lead. I lubricate the bullets with tallow, three parts, beeswax, one part; seat the bullets in the shells with the loader, and then dip the bullets into the melted lubricator just up to the end of the shell, then wipe off the point with a rag, and set the cartridge up on its base to cool off and allow the lubricant to harden. After firing a shot blow through the barrel to moisten the powder crust. In damp weather three or four full breaths will be sufficient; but in hot dry weather from seven to ten may be required. Always look through the barrel after blowing through, and you will soon become so expert that you can tell exactly whether your barrel is too dry or not. Never fire a shot through a dry barrel. You must have your barrel lubricated for the first shot, and after that dampened with the breath. But, says some one, this is impossible in hot, dry weather. No, it is not. Burnt powder has a great affinity for water. I have fired my twenty shots without cleaning in the hottest summer weather, when the gun barrel was so hot I could scarcely hold it, but never failed to get it damp inside before I loaded for the next shot. If the gun is very hot, hold your hand over the muzzle in such position that you can blow down between the thumb and first finger. The lips will not stand the same amount of heat as the palm of the hand. If there is shade in the vicinity of the firing point, stand in the shade until your turn to fire. If there is no shade, stand with your back to the sun and hold your rifle in front of you in such position that the rays of the sun cannot strike the barrel. In this way you can always keep your rifle in such condition that it will shoot where you aim it.

I inclose another target which I shot March 2, 1883. It is ten consecutive shots at 100yds. without cleaning, no artificial rest being

used, and the rifle was loaded as described above. It will be noted that a three cent piece will cut over six of the bullet holes and the center of the bullseye. This is not a "dude target," according to Maj. Merrill's definition. The center of the bullseye is not an indefinite point, but was plainly marked with a cross before the shooting began. The string is as follows: .21, .24, .28, .30, .33, .43, .56, .98, 1.02, 1.09=5½ inches. I am aware that this target is not as fine as the Gove target published by Maj. Merrill some time since, but it must be taken into consideration that it was shot with a light gun, without cleaning, and no artificial rest was used. By shooting from a dead rest a closer target could be made.

The breechloader is eminently fit to do the finest work at target, as the inside of the barrel is open to inspection at all times. E. A. L.

NORRISTOWN, Pa.

RANGE AND GALLERY.

THE ZETTLERS DEFEATED.—The hitherto invincible team of the Zettler Rifle Club of New York, met with their first defeat on Wednesday evening, March 19, at the hands of the Frelinghuysen Rifle Club, of Newark, N. J., at the range of the latter club. The match was for ten men, ten shots each, on the Massachusetts ring target, highest possible score 120, distance 25ft. The men of each team shot alternately in the following order, and with the appended scores:

Zettler Rifle Club.		Frelinghuysen Rifle Club.	
M Dorrler	112	Wm. Hayes	110
J H Brown	111	S H Shackleford	112
G Joiner	108	G D Weigman	113
P Fenning	114	E O Chase	105
D Miller	109	W P McLeod	113
W Klein	102	J L Tobin	113
C Zettler	112	J K Walsh	114
A Lober	115	R Westerman	108
G Judson	114	W F Lynn	110
M Engel	108—1105	A C Newman	111—1109

A collation was served by the Newarkers, and the visitors expressed themselves as well pleased with their visit and entertainment notwithstanding their defeat.

BOSTON, March 22.—The delightful spring weather of to-day was perfect for outdoor sports, and many riflemen who have failed to visit their favorite range, Walnut Hill, during the recent miserable weather, were out in force, crowding the shooting cottage and keeping the targets busy from early morn till sundown. Perfect as was the weather overhead, it was also grand for shooting purposes, both wind and light being very satisfactory, the former easy to control and the latter giving a soft, pleasant color to the paper and iron targets. The leading scores were all at 200yds.

E F Stevens	39	39	39	39	40—196
W Gray	42	41	35	39	39—196

SARATOGA RIFLE CLUB.—The following are the best scores for each man for Wednesday and Saturday, March 12 and 15, 200yds. off-hand, Massachusetts target. Wednesday, rainy and stormy; Saturday, very changeable wind:

I Davis	10	10	11	12	11	12	11	11	10	10	—108
Wm B Gage	11	11	11	11	11	10	12	10	11	9	—107
A G Hull	9	9	10	12	11	11	12	12	7	9	—102
A F Mitchell	9	12	11	10	9	10	10	12	11	19	—102
H Wellington	9	11	9	11	8	11	11	10	10	11	—101
O Wing	9	9	12	10	9	11	10	11	11	7	— 99
J Hays	12	8	10	9	8	11	10	10	6	10	— 94
W Allerdice	6	8	10	11	10	10	10	10	10	7	— 93
A Rich	7	7	8	8	8	7	9	11	7	8	— 80
L Corey	11	9	4	10	8	9	10	0	9	9	— 79

GARDNER, Mass., March 20.—At the last meet of the Gardner Rifle Club, there was a fine attendance of members. The American decimal target was used. The meet was at Hackmatack Range, distance 200yds. Out of a possible 100, shooting off-hand, the following totals were made:

A Mathews	10	10	9	9	8	5	10	9	8	8—86
M Atherton	7	9	9	9	10	10	9	7	8	8—86
G F Ellsworth	9	10	9	10	7	7	9	7	8	8—85
J N Dodge	8	8	8	10	8	8	9	4	10	10—83
D I Norton	10	8	9	9	7	8	8	8	10	8—83
G C Goodale	0	8	10	7	5	9	9	8	10	9—75
W C Loveland	9	9	8	7	9	10	6	7	8	1—74

JAMESTOWN, N. Y., March 14.—In the regular club medal match to-day the following scores were made, 200yds. off-hand, Creedmoor target, 10 shots; wind medium, from 9 o'clock to 3 o'clock changing continually, light good:

H V Perry	4	4	4	5	5	5	4	4	4	5—44
G W Shattuck	4	4	5	4	4	5	4	4	4	5—43
R H Burns	4	4	4	5	4	5	4	5	4	4—43
W H Sprague	4	3	5	4	4	4	4	5	4	4—41
O H Lilly	4	3	3	4	4	4	4	4	4	5—39

ZETTLER RIFLE CLUB.—New York, March 18.—Weekly shoot 12-ring target, possible 120: P. Fenning 113, M. Dorrler 118, H. Oehl 117, G. Joiner 114, C. Judson 113, M. B. Engel 113, H. Holges 105, A. Lober 111, D. Miller 105, P. Steinbach 108, Capt. N. D. Ward 110, C. G. Zettler 112, B. Zettler 108, T. C. Noone 108, J. Adrian 103, H Eiberin 102, H. Von Derlinden 100, Wm. Wiegandt 105.

BULL'S HEAD RIFLE CLUB.—At the regular weekly meet on March 13, the scores stood, 12-ring target, possible 120, gallery distance: A. Lober 119, M. Dorrler 118, C. Rein 116, V. Steinbach 115, G. Zimmermann 115, G. D. Johnston 114, J. Schrarder 113, A. Stolzenberger 106. J. Schneider 106, D. Holland 104, G. Wendelken, 103, S. Mehrbach 103, J. F. Campbell 102, H. A. Wasmuth 101, S. F. C. Weber 100.

A GOOD RECORD.—Company H, Third Infantry, of the regular army, includes in its muster roll two of the eighteen best marksmen in the United States Army, as shown by scores made in the year 1883. These are First Lieutenant Philip Reade and Second Lieutenant F. P. Fremont. No other company in the service has two representatives in the team.

NEWARK, March 22.—The fifth tournament of the Newark Rifle Association ended on Monday evening last, with the Frelinghuysen to the butt: G. D. Weigman, 50; E. O. Chase, 47; Wm. P. McLeod, 50; A. C. Newman, 47; S. Shackelford, 45; F. W. Lynn, 45; George Zimmer, 44; G. Williams, 46; J. K. Walsh, 45; R. Westerman, 46. Total, 465. The Frelinghuysen lead in the five tournaments 18 points. The last match will be shot on the Warren Range.

LOADING CARTRIDGES.—I notice that "W. M. F.," in answer to "G. F. W.," in relation to loading rifle cartridges, says: "In no case compress the powder." Can any one inform me why? I have been crowding 45grs. of powder into a .44-cal. Winchester shell designed for 40grs., and find it increases the penetration, at least with a freshly-loaded shell, which was the object aimed at. Is it dangerous to compress powder, and can compressed powder always be depended upon to give the same result at every shot?—H. C. S.

A NEW GUN CLUB.—A gun club has been recently organized at Perth Amboy, N. J., for glass ball and clay-pigeon practice.

FIRE LOW.—The correspondent at Tonquin have been investigating the tendency of the Chinese troops to fire low in action as the many leg wounds among the French troops showed was the habit, and one who is well qualified to judge says: "The reason why the Black Flags and their allies fire low is due to the fact that the bulk of the Chinese had no idea of the use of the sights on the rifles, and it was almost useless to attempt to teach them the value of such contrivances. Thus, a Chinese soldier, armed with a modern rifle, would never think of raising the sight of his weapon when he was called upon to use it, especially in the face of an enemy. He would fire at an object 600 yards off with the sight down, the consequence being that, the muzzle of the rifle not receiving the necessary elevation to carry the bullet over a long distance, the ball would strike or descend very close to the ground before it reached its destination. It was also asserted that some of the Chinese soldiers actually knocked the sights off their rifles as being useless."

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

BOSTON GUN CLUB TOURNAMENT.—The convenient grounds at Wellington, on the 19th, found assembled representatives from nearly all the important shooting clubs in the New England States to contest the different events which had previously been advertised to take place. Fine weather opened up the day's shooting, but a threatening shower gradually interfered with fine scores. Notwithstanding this, however, a large number of Mother Earth's chickens returned to roost, quite satisfied, doubtless, that tournament days are bad days to be out. A very large number of visitors were present, particularly during the medal shoot. The medal itself is considered a fine piece of workmanship, being simply a gold clay-pigeon pendant from an ornamental bar, while below is another bar of beautiful ornamental design.

First match, 7 single birds, 18yds.

E W Law	7	C F Stark	4
C Wilbar	5	O H Gerrish	6

Hall					

Shoot No. 7—Five single birds, 18yds. rise.—De Rochmont, Stark and Cary first, Curtis and Nichols second, Law and Tinker third, Eager fourth.

Shoot No. 8—Seven birds, 5 traps, 18yds. rise—Hart and Stark first, Decker and Law second, Palmer third, Field and Cary fourth.

HARVARD CLUB.—At the meet of the Harvard Shooting Club, last week, Mr. Slocum acted as executive officer and Mr. C. A. Brown as scorer. The result of the match was as follows:

Match 1, five balls—First, W. L. Allen, Slocum, second, Abbot, F. Austin, W. Austin, Palmer.

Match 2, Walnut Hill cup, 15 balls—First, C. C. Foster, F. S. Palmer; second, F. Austin, Abbot, Foster and Palmer tied on 11 balls, but on shooting off the tie, miss-and-out, Foster won.

Match 3, five clay-pigeons—First, Palmer; second, Allen.

Match 4, five clay-pigeons—First, F. Austin, Edmands, Slocum; second, Palmer.

Match 5, five balls—First, Foster; second, Slocum.

Match 7, five balls—First, Slocum; second, F. Austin, Allen, Foster.

Match 8; five balls—First, Edmands, Palmer, Slocum; second, F. Austin, Goodwin.

The weather was windy, and the snow which fell made it difficult to see the balls and birds.

FAIR HILL, Md., March 15.—Regular practice shoot, 21yds., glass ball, varying trap.

J Peterson	100101001111011 — 9
F Foote	011001111010111111111111 —20
E Garrett	101111111111111111011111111—35

DELHI, March 19.—At the annual meeting of the Delhi Sportsmen's Club the following officers were elected: President, E. L. Hitt; Vice-President, M. D. Sears; Treasurer, F. H. Griffis; Secretary, G. W. Youmans. Board of Directors—William Millard, G. E. Maxwell and J. N. Arbuckle.

WORCESTER, Mass., March 20.—The series of matches between the South End and the Woodland Gun clubs ended to-day by a victory for the Woodlands. There were five men to each side. Each man had a possible 20 before him. The glass balls were thrown in strings of five each. The result was a victory for the Woodlands, as the clubs had each won a game, although the totals of each club at the close of to-day's shooting were the same, 200 out of a possible 300 points. The following is the details of to-day's work:

South End Club.

Webber	01101	11111	10001	11101—14
Whittaker	11111	11110	01101	01111—17
Whittier	00001	11110	01101	01110—11
Jewett	11100	00010	11010	00010— 8
Davis	11110	11111	11100	01111—16—66

Woodland Gun Club.

Fuller	11110	10101	10110	01101—13
Rice	00111	01111	11101	01111—15
Moscroft	11101	01111	11011	00101—14
Gilman	00001	10011	10111	11101—12
Tongas	11111	01100	10001	11111—14—66

The first meet of this series was at the South End Range, the second at Woodland Range, and the last at Coal Mine Range, the home of the Worcester Sportsmen's Club. The total for the three meets is as follows:

South End Club.	1st.	2d.	3d.		Woodland Gun Club.	1st.	2d.	3d.	
Webber	17	14	14—	45	Fuller	11	18	13—	42

Jenkins	1 1 1 0 1 0 1 0 0 1 0 0 1 0 0— 7
Kohlhase	1 1 1 0 1 0 1 0 0 0 0 0 0 0 0— 5
Ed Ross	1 1 1 1 0 1 0 0 0 0 0 0 0 0 0— 5

STATEN ISLAND GUN CLUB.—The shoot for the Treasurer's Cup came off on March 15; 10 birds each, handicap rise, 30yds. boundary, 5 ground traps, 7¾lb. guns; ties, miss and out.

Raymond, 25yds	1 1 1 0 1 1 1 1 1 1 1 1 1 1 1—13
Howard, 28yds	1 1 1 1 1 1 0 1 1 1 1 1 1 1 0—12
Boughton, 27yds	1 1 1 1 1 1 1 1 1 1 1 1 1 1 0—11
Stelfox, 27yds	1 1 1 1 1 1 0 1 1 1 0 — 9
Stewart, 27yds	0 1 1 1 1 1 0 1 1 1 — 8
Minto, 28yds	1 1 0 1 1 1 1 1 1 0 — 8
Francis, 28yds	0 1 1 1 1 1 1 1 0 w. — 7
Grant, 27yds	0 1 1 0 1 0 1 1 1 0 — 6
Redmond, 27yds	1 1 1 0 1 0 0 1 1 0 — 6
Thompson, 28yds	0 0 1 0 1 1 1 0 1 w. — 5
Lee, 25yds	0 1 0 0 1 1 0 w. — 3
Thomas, 27yds	0 1 0 0 w. — 1

THE LIGOWSKY TOURNAMENT.—In reply to inquiries it is stated that the rule 1¼oz. shot should read 1⅛oz. per Dixon's measure, 1106 or 1107.

Sportsmen attending this tournament will probably have the opportunity of taking in a general shooting circuit. The Chicago sportsmen are organizing a live bird shoot to precede the tournament, the Louisville shooters have already issued an attractive programme to follow same, and now the Cincinnati shooters are talking of a fourth tournament immediately after that at Louisville.

Henry Miller, Esq., of Chicago, Ill., member of the executive committee, writes as follows: The Illinois Central R. R. grant a 1½ fare to sportsmen attending the tournament; the sportsman pays full fare to Chicago, and upon presentation of a certificate from our executive committee, is furnished a ticket home at ½ regular rate. I expect to get the same concession from all the roads at their next meeting about April 15. All clubs contemplating attending the tournament should not fail to enter by said date, as it will materially assist me in obtaining a like reduction from all other roads.

MALDEN GUN CLUB.—March 22.—The springlike day called together some thirty sportsmen at the grounds of the Malden Gun Club. The first part of the afternoon a cross wind prevailed, which kept down the scores, even below the average. The contests resulted as follows:

First event—badge contest:

J Hopkins, 1st medal	0110110010—5	1011111111—9—14
E J Brown, 2d medal	0011110110—6	0010011101—5—11
Smith, 3d medal	0110110000—4	1000111011—6—10

Second event, five birds—Dutton first, Field and Brown second, Dill third.

Third event, five birds—Adams and Hopkins first, Field and Ellsworth second, Dill third, Taft fourth.

Fourth event, five traps, Chicago rules.—Brown first, Purington second, Field third, Adams and Scott fourth.

Fifth event, five birds—Ellsworth and Dutton first, Purington second, Field third, Hopkins fourth.

Sixth event, five birds—Dutton and Nichols first, Purington second, Adams and Scott third. Dill and Field fourth.

Seventh event, miss and out—Divided by Adams and Field.

WELLAND, Ont., March 14.—The meeting to-day of Geo. Rodgers of St. Catharines and Capt. Ritter drew several hundred interested spectators. The match grew out of a performance of Capt. Ritter in which firing at 30 balls he tied two good marksmen firing at 25. Mr. Geo. Rodgers, of St. Catharines, considered the best shot in Western Canada, immediately challenged the Captain. Two matches were arranged, one to be at glass balls and the other at live pigeons. The stakes to be $100 a side on each match. At a consultation of the friends of the parties, it was decided that the new ball made by the Niagara Target Ball Co., of Niagara Falls, N. Y., would give a fairer and more just test.

Upon the shoot being called, Mr. George Barker, of Niagara Falls, N. Y., was chosen as referee; Mr. John Carlisle, of St. Catharines, judge for Mr. Rodgers; Mr. E. A. Smith, of La Salle, judge for Capt. Ritter.

First Match—Thirty Niagara target balls.

Capt. Ritter	101101111101111011011111011111—24
Mr. Rodgers	010111111111111101110111010111—24

First Tie.

Capt. Ritter	00111—3
Mr. Rodgers	10101—3

Second Tie.

Capt. Ritter	100—1
Mr. Rodgers	100—1

Third Tie.

Capt. Ritter	11001—3
Mr. Rodgers	11000—2

Second Match—Fifteen live pigeons.

Capt. Ritter	010111111101011—11
Mr. Rodgers	011111111100111—12

Each having won a match leaves the matter just as it was before. Their friends are trying to make arrangements for a match to decide it by a shoot at 100 Niagara target balls for $100 a side.

TORONTO, March 18.—A pigeon match between C. Cockburn, of Toronto, and John Forbes, of Woodstock, for $100 a side, took place at John Oulcott's, Eglington, this afternoon. The arrangements were that Forbes was to shoot at 33 birds to Cockburn's 30; Dominion rules to govern; 21yds. rise, 80yds. boundary. The betting was 10 to 7 and 10 to 8 on Cockburn. The weather was fine and the attendance large. J. Wilson acted as referee. Following was the score:

Forbes	011101000111011101010000000010000—15
Cockburn	110101011101111101100100100010—13

Cockburn thus won the match by three birds. The birds were lively, and the wind anything but favorable to shooting.

OSWEGO, N. Y., March 13.—The long talked of match between Ed. Plank and O. S. Osterhout on one side, and G. P. Matteson and L. C. Wright on the other, came off this afternoon on our Leatherstocking Club grounds. The day was all that could be asked for at this time of year, and a good number of spectators were present. Geo. W. Lyman and Owen Matteson acted as judges, P. O. Wright as scorer and referee. The match was 50 glass balls each man, thrown from a Card revolving trap, Card rules to govern. The match was won by Matteson and Wright, they breaking 81 out of a possible 100, against Plank and Osterhout 77. The old-fashioned wide awake fighting fever is visible in all our members this spring.—DAN.

Yachting.

FIXTURES.

Sept. 13.—Hull Y. C., Club Meet.
Sept. 13.—Boston Y. C., Second Ladies' Day.

THE GLEAM AND ANETO.

Editor Forest and Stream:

For reasons anticipated in your comments on the offer of Mr. Prague, I unhesitatingly decline the suggested contest.

During the approaching season I will, sacrificing time allowance, give my friend Mr. Lawton every opportunity to redeem his defeat in the chance trial last fall, but the conditions of weather must be the same, such as will bring the Gleam to two reefs.

I suggest, but do not stipulate, in the event of such a trial, the loser shall, to place the result on record, donate $50 to a charitable institution to be selected by the winner.

New York, March 25, 1884. The Owner of the Yawl Aneto.

THE PETREL.

An unfortunate transposition of the types in the table last week needs correction before proceeding. The ballast on Petrel's keel is 5,474lbs., and the amount inside 2,526, which will make the comparison with Gleam more intelligible. The hoist of mainsail is 20ft. against 23ft. of the Gleam, or increasing the latter boat to the length of Petrel, the comparison between hoists would be 20 to 28, and between the areas 800 to 1,106, showing great economy in favor of the narrower boat. The same is expressed by the percentage of sail area to square of loadline, Petrel having 102 per cent. against the 149 per cent. of Gleam. The sail plan of the latter is the largest in proportion to length of any fixed ballast boat of which data are known.

The present mast of Petrel is built of two halves, slightly cored out, glued, doweled and pinned together, with but little taper to mast-head. The object was to combine lightness with the stiffness of large diameter, as the ancient vagary about give and elasticity to spars has about disappeared from the category of fairy tales worshipped among the "intuitive" classes. Spars as rigid as they can be stayed with due regard to lightness are now accepted as equally as necessary to smart performance as flat sitting and broad-headed canvas. The Petrel's experiment seems to have been a perfect success, as her mast never buckles, nor does the masthead twist with exposure to the weather, and the stick never "complains." The building of masts may be considered an improvement, but it should be borne in mind that unless accurate and faithful workmanship can be counted upon to a certainty, a built mast is a treacherous and dangerous affair not deserving to be trusted. Much weight will not be saved, but weight for weight, greater strength and stiffness can be secured by a competent mechanic familiar with spar making. Petrel's topmast is fidded to house and the bowsprit reefs in over the wood boomkin. She has two shrouds and backstays each side, and the jib martingale nips under an iron dolphin striker. The boomkin is steadied by an iron rod jumper or bobstay.

The cabin has 24in. berths each side, 13ft. long and 32in. of floor between. The house overhead is 12ft. long and only 10in. high at after end, being kept low for convenience on deck. A square hatch 16x20in. gives access to the forecastle in which the stove, pantry and cooking gear is located:

Area lower sails	800 sq. ft.
Ratio to square L.W.L.	102 pr. ct.
Area mainsail	522 sq. ft.
Area foresail	132 sq. ft.
Area jib	146 sq. ft.
Mast deck to hounds	25ft.
Masthead	4ft. 6in.
Topmast, cap to shoulder	12ft. 3in.
Rake of mast	1 in 21
Main boom over all	28ft. 6in.
Gaff over all	17ft.
Bowsprit, end L.W.L to cap	5ft.
Jibboom, cap to stay	9ft.
Mainsail on luff	20ft.
Mainsail on head	16ft.
Mainsail on foot	27ft.
Mainsail on leech	32ft.
Foresail on luff	24ft.
Foresail on foot	12ft. 6in.
Foresail on leech	21ft.
Jib on luff	29ft.
Jib on foot	15ft.
Jib on leech	20ft. 6in.

ISIS.

This new cutter is 62ft. 6in. over all, 51ft. loadline, 13ft. beam and 9ft. draft, with a steadier of 16 tons on the keel. She is now being planked up at Poillon's yard, in Brooklyn. The best part of this yacht is her design. Her construction is something enormous. The keel is a balk fit for a seventy-four, the frames are double all through and within an inch and a half as heavy as those of the big schooner Fortuna. The deck frame is a stunner. Beams have been tumbled in at every framehead in profusion, and of a strength and weight astonishing. With such material, corresponding fastenings ought to be expected, to secure the benefit of the extravagant weight; but, strange to say, these beams are merely spiked to the shelf, with no other fastening whatever! Can this possibly be the intention? What is the use of massive material without sufficient connection? Unless some further provision be adopted for tieing the sides, such as thorough kneeing, the first time this cutter gets it rough and tumble she will wring out of shape, open and leak like a basket, for the rig to drive her bulk and beam will be of respectable dimensions. The quarters and transom are one solid mass of wood, beyond anything of the kind put into a similar vessel. Yellow pine filling, into which the forward frames box, is a poor substitute for oak. If the cutter is completed as she has been begun, three tons of weight will have been wasted on her structure, and most of that high up. It should have been in lead low down, for a boat of her beam and displacement requires a deal to correct her "wobbly" tendencies. As to her form, it is excellent and very fair upon her dimensions, but we cannot but think she would have been all the better with 9in. off each side. Deck room would have remained ample and the accommodations below need not have been interfered with at all. It would have given a kinder form to drive and a better shape looking to windward. As it is the forte of Isis will be reaching and sailing in light weather. When it comes to crowding she will choke, because of her exuberance in beam. While her form, and especially her notable fairness, promise general satisfaction, the wasteful disposition of her scantling is certain to detract from her prospects as a flyer. For cruising Isis has scarce an equal. The vacancy down below will give the largest accommodations on record in these waters. Indeed, in the way of room she can compete with the ark. In view of her small hatches there is likewise gangway and passage on her deck, such as New Yorkers have never before seen on the length. She will prove enormously stiff and presumably it will be impossible to carry her rail under. For all of these reasons, it seems as though a more favorable average might have been struck with 11ft. 6in. instead of 13ft. beam. But as an experiment in the way of wide cutters, no one

will withhold full recognition of the owner's enterprise, as he designed the yacht himself. As a wide cutter, we are prepared to say her form is exceedingly pleasing, with the bulk distributed in almost faultless proportion, though for climbing to windward, we might have preferred just a little shorter entrance so far as inspection of the frame served us as a guide by which to pronounce judgment. She is a credit to the yard as a thoroughly fair job, and but for the exceptions before noted, might have been the most sensible vessel yet set up in the establishment. Now that the modern yacht has invaded even this historic old ground, we have no doubt some of the contemplated new cutters will rise in their glory at the same yard. The worthy Mr. Townsend, who presides, knows "how it is himself" after having come across the clipper fleet at sea, and prejudice is fast wearing away. For the rest the yard can turn out the best of work with some one to direct the innovations upon old customs in detail, and Mr. Townsend can be relied upon to see them lived up to in full faith.

THE COST OF YACHTS.

ORDINARY business principles ought to apply in comparing the cost of yachts as in anything else. There is no reason in holding up the first cost of two vessels in comparison without allowing for difference in quality of construction, equipment and cabin fittings and without regard to longevity. It is quite certain that a well-built vessel, thoroughly and completely supplied in every respect with expensive and artistic interior, will call for a greater first outlay than an inferior affair in every respect. But when the lifetime of a well-built and a cheap job are taken into consideration the balance sheet will show in favor of the best boat. Thus, the schooner Columbia was built in 1870 at a cost, as near as is known, of $35,000. She was put to very light service during her career, but in 1884 was found so thoroughly rotten and used up generally that her recent purchaser has been obliged to rebuild entirely. He paid $10,000 for a name and proceeded to build a new boat around the name at a fresh expense of about $30,000. The first owner paid $35,000. The second about $20,000. Loss $15,000. The third owner paid $10,000. Additional loss $10,000, and he has now to expend $30,000 in rebuilding from keel up. Total amount sunk in the Columbia in fourteen years, $65,000! On the other hand, had the Columbia been built originally to class highest in Lloyd's instead of being soft wood thrown together with spikes, the first cost might have been $15,000 more than was paid for her, say $50,000. She would after fourteen years have brought at least half her cost, or $25,000, so that the amount sunk would have been only $25,000. To this add $5,000 for an overhaul, and the saving up to date would have been $25,000. That is to say, the Columbia, well built and fitted in the first place, would have cost $25,000 less to date than the Columbia built as the slop job she actually was.

Further, the cost of the Bedouin, without the extra expense of artistic carvings and decorations, upon which no limit can be set in any yacht, was $34,000. The cost of a cheap sloop of same size with only half the regular equipment will be $24,000. In twelve years from time of launching Bedouin will sell for $24,000, assuming reasonable care in her keep, and the cheap sloop would bring but a nominal sum of say $100, and require another $10,000 to put her into equal condition with the Bedouin. Loss in twelve years on the Bedouin $10,000; loss on the cheap sloop $24,000.

Finally, the type of a boat, the mere shape of the volume enclosed, has nothing whatever to do with the cost of build in the first place, as common sense ought to demonstrate to every one without explanation. The cost is due to amount of material and labor used in the production. In a cutter the material and labor need not exceed the requirements of a sloop. Both call for like expenditures for equally good and complete equipment and wealth of cabin fittings. The larger displacement of the cutter necessitates from twenty-five to forty per cent. more ballast over the sloop of modern proportions, an extra charge which is offset by a smaller sail plain and the easier conversion of lighter material used in framing and finishing an easier form of body. As to yachts even this difference of ballast disappears, since small sloops of recent construction displace as much and in some cases more than cutters of same length. Such boats, possessing in their great beam also a greater stock of material, more labor and a larger rig, must cost quality for quality more than a cutter of same length. We have in recent numbers given many actual examples, showing cutters to be as cheap, and in some instances cheaper, than sloops, and if builders still bid wild on contracts for cutters, or insist upon making a fortune out of one such job, by "milking" rich and inexperienced or financially generous men, the competition of the future will bring about a true balance between the cost and the article rendered therefor.

The cry against cutters on account of their supposed greater cost than other modern types approaching the cutter in performance is a nonsensical bugbear, and is put forward only by illogical persons who know nothing about the matter beyond what they gather and magnify from greenhorns chatting in club rooms. That this or that specific cutter can be pointed out as having cost more than a poverty-stricken sloop is true enough. But others can also be found which, with superior build and equipment, have cost less. Whatever the facts in specific cases may be, common sense is enough to prove that there is no ground why, quality for quality, there should be more than normal difference in first cost of cutter or sloop, and that difference is as often likely to be on one side as on the other. The most expensive yacht is, as a matter of course, the largest on the length, whether the bigness be due to great depth or to great beam. Naturally, boats having both great beam and depth, such as the Itchen cutters or Boston keel sloops, will represent the largest expenditure of material and labor, all upon the assumption that the comparison is between boats of equal strength and grade of material, equally complete in equipment and the luxuries of the cabin.

THE S. S. NORMA.

THE new steamer Norma is now being planked and is about ready to receive her decks at the yard of C. & R. Poillon in Brooklyn. We confess to disappointment in the vessel. It had been expected that emanating from the drawing board of a mechanical engineer, this latest addition to the steam fleet would have had some style and merit in model and build. The very opposite unfortunately proves to be the case, and one more commonplace piece of mediocrity is all the world is to witness in her launching. The vessel is of course whittled away to a knife-like entrance, which seems to be the *summum bonum* of the ambition of all our designers and modelers of steam yachts. She has a long entrance of the usual overdone kind, and from midships aft is a veritable trough with a tiresome flat to the side, ending in a characterless stern of the ancient watermelon pattern borrowed from our gunboats of twenty-five years ago. The only commendable point in her design is good deadrise, and this, we believe, was incorporated at the instigation of Captain Towns, who is now looking after the development of his future charge. The sheer of the boat is most unhappy; a straight amidships, a sudden turn another straight and a short quick scoop upward to the yellow pine planksheire butts into the round head. Another sudden bend on the quarter and a slower sweep thence to the elliptical finish aft. If the sweep is unfair in and out, the sheer is likewise vertically broken. Has art and eye been so completely lost in shipbuilding practice that no one ventured to correct as the frames went up, or was it merely a knot in the battens? In point of design the Norma expresses no ruling idea, no principle, much less ordinary unity throughout. She is devoid of character, much as if built by the mile and sawed off to order, or brought to a close when talent dried up untimely. In point of construction the whole job is of the rough and ready class, at which the nose of a Lloyd's man would turn up involuntarily. The exceptional feature is a fairly good connection between beam ends and the top side as a thwartship tie procured by working two thickstrakes inside the shelf and bolting through all, but this is an antique method also borrowed from old gunboat specifications. The plank is none too thick in the rough, and with one to three eighths dubbed and planed away to smooth up, would not receive a high rating at Lloyd's in view of the material used. The yacht has white pine beams in wake of the cabin, and though tolerably strong throughout for limited runs along the coast, she is far from exhibiting the class of fine workmanship, material or fastenings to be expected in so large and costly a structure. For this the builders may not be to blame. They build for a price, and no doubt have given fair return and fully lived up to their contract.

Those who have seen the exquisite cabinet work put into the frame and fitting of Ileen, Bedouin and their sisters, will contemplate with regret the comparatively rare methods pursued in this new steamer. But when painted up and painted with gorgeous tinsel and lavish display in the cabin and plenty of brass about decks, the Norma will be hailed at her launch by admiring crowds as "another magnificent" addition to the yacht fleet of the metropolis. Concerning the power we cannot speak from personal observation, but as it is to come from Sullivan's hands it is pretty good guarantee that the engines will be fine specimens of the machinist's art. The boiler is to be of steel, 9x15ft., of the pattern known as the "Scotch" boiler. The engines are compound, with 18in. stroke and cylinders 22 and 36, the low pressure being on top, both piston heads attached to the same rod. It will be compact, occupying only 5ft. space fore and aft, and the upper cylinder top will scarce reach into the hatch. It is to drive a wheel 8ft. in diameter. The yacht is to have an open network rail, and unless the hatch coamings are kept of extra height there will be considerable danger of flooding out below, though the vessel is likely to prove a fair performer in a sea on account of her length, deadrise and easy bilge. If she is no better than others of her class she is probably no worse. But there is a great deal of room left for material improvement in every respect. She shows the novice at the business all over, and the sad want of supervision by a real expert in yacht design and construction. But almost anything appears to be good enough as yet, and until some standard sample of well-conceived planning and exacting construction in detail appears in our waters, few will appreciate the difference in the prevailing opinion that "a boat is a boat," and that the only difference between rough, common, short-lived "boat work" and finished shipwrighting is a margin of cost in favor of one and against the other. We trust the wily skipper, who is to be, will keep an eye on the pilot-house and its bracing, and have the well-hole, above which it is to be built, caulked tight from the rest of the ship for reason obvious enough to a sailorman of his experience. Length over all, 150ft.; water line, 130ft.; beam, 19ft.; hold, 12ft.; draft, 9ft.; freeboard amidships, 6ft. Schooner rig. Masts, 64 and 68ft., with 26ft. topmasts; bowsprit, 18ft. beyond stem, lug sails to brail up, having 20 and 24ft. gaffs; keel, 10in. square, with 2in. shoe; stem and post 10in., sided; post, 16in. at shaft. Frames, oak and hackmatack, sided 5in. and moulded 8in. at heel and 3in. at head, double: space 27in. centers, and bolted with ⅝ iron. Clamps, yellow pine, 4 and 3in. thick, 12in. deep each. Plank, yellow pine, averaging 2½in. Tapstrakes of oak, square fastened with ⅞in. locust treenails below water line, and with iron spikes above. Coamings of mahogany, 4x6in., bolted down with ¾in. iron. Accommodations include cabin, 19ft.; owner's room, 12x11ft., with bath and toilet and two staterooms, all aft of machinery. Officers and crew forward. Pilot house 7x6ft., with smoking room, 10x8ft., attached, will be on deck forward.

SOME FINAL GENERAL REMARKS.

Editor Forest and Stream:

I quote from your reply to my last: "Weight in itself, without consideration of form, is not productive of resistance, but form, without regard to weight, certainly is." According to that, no amount of weight will offer resistance, and a square can be driven through the water by the same propelling force, at the same speed, as a triangle. I cannot assent to such a proposition. Departing from theories, I will say in support of my claim that superior weight must offer the most resistance; that upon a certain afternoon in August last, when the wind, though steady, was extremely light, the sloop Lizzie L. met the cutter Oriva off Owl's Head, and in beating down the bay from that place, though never out-pointing her, did out-foot and wind her, and retain the lead throughout the entire afternoon; that the very next afternoon Mr. Lee again brushed with her, and, the wind being much stronger, succeeded in regaining his lost laurels, which, if your theories were correct, he should never have surrendered, particularly when the immense disparity in size between the two vessels is remembered, the Oriva being 50ft. and some inches on loadline, against 42ft. and odd for the Lizzie L.

Again, that the same sloop met the Madge both in afternoon sailing and during her races, and invariably beat her, notably on the occasion of the first Madge-Wave contest, when the Lizzie L., carrying only working topsails ran away from the cutter, which had set at the time the most tremendous club topsail that I have ever seen on a sloop of any size or design; that this superiority was so well appreciated by the Lizzie L.'s owner that on separate times he offered to match her for any amount, she was invariably refused, on the plea that they were not open to any more challenges, having all they could attend to, although the facts were that she did afterward accept the challenges of the little Mistral and, I believe, the Paloma. The above events were all in light airs, and I am convinced were exhibits of the superiority of lightness, in good form, over weight, ditto, in summer zephyrs.

That a well-formed boat, whether weighted or not, will beat a tub, is a foregone conclusion. Where lightness was in good form, I have never yet seen it defeated under the above conditions. The whole issue between us, then, resolves itself into the simple question as to what is or is not "good form." My contend is that it may be secured without going to either extreme depth or narrowness; that a vessel with four beams and one-tenth her length in draft is best suited to our weather and waters. Quoting the knowledge of the ancients and stating that there is "nothing new under the sun," is begging the issue. I claim that the more sensible of our yachtsmen (who were in the minority, of course, as common sense never was "common" on any topic) were fully aware, many years before Anglo-mania-crazed Americans, either in yachts or manners, that a "skimming dish" with sandbags was not practical sailing; that there were a number of sloops in New York Bay of 50ft. and under, prior to '79, with as much draft as I now recommend; that you cannot rightfully claim "double-head rig" as an exclusively "cutter principle;" that double-head rig was in use by sloops before cutters were known, and that cutters themselves are simply variations of a type known as sloops, which had a previous existence and from which they were evolved. You say in regard to this that "no hard and fast line can be drawn," but at the same time leave your reader to infer that, after all, these so-called sloops now building are really cutters in disguise, which the advent of cutters has created and which would never have existed but for that advent. I admit that the cutters did much to accentuate the revolution; but, at the same time, I claim that it was simply the accentuation of a movement already started, and I prove my proposition by pointing to the lists of the New York and Atlantic Yacht Clubs, published in January, 1880, which show quite a respectable fleet of sloops with plenty of draft.

"Extremes are dangerous," is an old and well tried proverb very generally known, and as long as yachtsmen can face the same weather with moderate draft as they can with extreme draft, and at a much less expense for the pleasure, they will surely continue to do so. You say that "mentioning prices of yachts out of hands is not a fair comparison," and that "long after the Gracie is broken up for firewood the Bedouin will have fair market value." I contend that prices are the only comparison possible if we wish to get at the item of expense which is certainly "a consummation devotedly to be wished." I contend that a first-class sloop, which shall be complete in every detail, of the very best construction, of the same loadline length as the Bedouin, can be built, ballasted and rigged for one-half of the Bedouin's cost. That when so built she will be equal to the same exigencies, and remain so for as many years. That the Bedouin may still be good when the Gracie is broken up, is quite possible; the fact that the Gracie was already a very old boat when the Bedouin's keel was laid, making the proposition all the more probable. You state that the Grayling was proclaimed as "uncapsizable while on the stocks." I never heard any one make such a claim, and I witnessed her construction, discussed her model with her owner, designer and a whole host of other yachtsmen. Mr. Fish asked for a light draft boat, and knew that it could be capsized when he asked for it. He has since admitted to me that he capsized her through over-confidence in her ability to take the flaw of wind, the strength of which he did not foresee, and I firmly believe that the Bedouin even, struck by the same flaw, handled in the same way, would either have capsized or carried away her mast. I do not believe in the uncapsizability of any kind of craft. A cutter, in England, foundered at her moorings in a gale of wind last spring without a rag of sail on her; and there are conditions under which a man-of-war can be turned over, *vide* the Royal George, which capsized at anchor with a puff from off the hills.

I notice in your last issue a statement that Captain Joe Ellsworth admitted that the Fortuna had the Gaelet cup race in hand, and only lost it through carrying "improper" sail. I am inclined to think that Captain Joe Ellsworth may have admitted that improper sail had something to do with Fortuna's defeat, but I am positive that he never considered that the sole cause for it, for before Fortuna set the maintopmast staysail, as the very instant that, in rounding the Sow and Pigs Lightship, he learned she had but 12 minutes lead, he expressed his confidence in the Montauk's ability to win, and could not have founded that confidence on anything but his belief in the superiority of his vessel, which was duly verified.

I also notice from "Hand Lead," some quotations as to depths of frequented harbors. That such depths exist I have no reason to doubt, but that they only exist, in the majority of instances, in the narrowest channels, which a yacht "on the wind" could not keep in, is also true, and I still claim that there are twenty yacht-frequented harbors between here and Marblehead, that vessels of 10ft. draft find the greatest difficulty in entering, and even after entrance, are compelled to lay too far off shore for any convenience in hailing, etc. Yachts cannot be sailed within their own widths like steamboats, and unless a channel is 100yds. wide, it is of very little practical use to them, and if a yacht must "come to" beyond hail of the shore she might as well remain outside of the harbor altogether as far as convenience is concerned. FRANKLYN BASSFORD.

[Mr. Bassford's mention of square and triangle is unfortunate, his parallel being directly opposed to the meaning our language conveyed. We suggest a study of naval architecture, which would give a clearer conception on many heads and prevent such absurd guessing as to the possibility of the Bedouin's capsizing, and the citation of the Royal George, who, with her topsides and three tiers of guns, all run across to leeward for listing the vessel to clean bottom, represents the very antithesis to a cutter's stability. It appears that Mr. Bassford has known it all right along, has always been familiar with and appreciated the principles of a cutter and her rig, and that it was quite impossible for him to learn anything new by recent agitation. This is all highly complimentary to Mr. Bassford, only he must not confound himself with the public. It has taken FOREST AND STREAM five long years of the hardest kind of fighting to force from the public *de facto* recognition of cutter principles, old as Mr. Bassford properly claims their origin to be. No one has set himself up as the "discoverer" of cutters or the principles they are built on, since they are based on the laws of nature, which mankind has been learning to master piecemeal through a great many centuries. What we have done, however, is to hasten if not actually compel, recognition of those laws in practice, for which the complete change in yachting architecture in America stands witness, and we only regret that in that hard battle we should have been obliged to work without the aid of a gentleman of Mr. Bassford's ripe and far reaching knowledge which comes before the public a little late in the season. We also regret to find Mr. Bassford giving vent, unintentionally no doubt, to an exceedingly stupid burst of buncombe borrowed from the vulgar, in his reference to "crazy Anglo-mania." The national origin of the cutter ought to be a matter of perfect indifference to so astute a philosopher as Mr. Bassford, for he must feel that the sciences and arts are international in their scope. Does Mr. Bassford repudiate the multiplication table because such forsaken wretches as the English subscribe to its intricacies? And in deigning to accept wicked English precedence in that respect, is he not as guilty of "crazy Anglo-mania" as others to whom the experiences and settled results of the first and oldest and most thorough yachting nation appeal more enticingly than the blind, initiatory floundering of the raw material in America? with whom the "patriotism" of a fresh and green lubber is still deemed a full equivalent, offsetting the mature insight of specialists and experts? That large displacement can be driven as fast as light weight and with no greater sail has been proven by innumerable matches here and in Boston, and this the irrelevant case of the Lizzie L. and Oriva, with the evidence from one side only, which in the least upset. Theory offers a sound explanation, and it is so simple that such a trifle ought not to have escaped a close and comprehensive student like our correspondent. With large weight you can afford to clip beam and still carry sail. Clipping beam decreases resistance of form, as the form of least resistance is manifestly a plane having no thickness or beam at all. But light weight demands beam to carry sufficient sail, and clumsier proportions have to be forced through. Hence, with equal talent in the shaping of a heavy and light boat, one will gain where the other loses and *vice versa*, so that, within bounds, both present like possibilities for speed with important special reservations in favor of weight. First, in light airs, the greater momentum of the heavy boat maintains speed through flaws and let-ups. Witness the manner in which a loaded boat holds her way and the sudden checking of a light catamaran the moment they pass under a lee. Second, the heavy boat can be laid higher and edged up with more noticeable benefit. Third, she can be luffed out on the light boat's quarter and take her wind without fail, as the light boat loses way first. Fourth, the heavy boat is always more certain in stays. Fifth, she will headreach in short work. Sixth, in a sea and light wind she is steadier and gains in speed, as witness last fall matches outside the Hook. Seventh, in a heavy sea her weight rams her along when a light boat will "break up" and pound or spank. Eighth, you can press and carry on with heavy weight on proper form to good purpose, which you cannot with light weight and the required beam, without overdriving and choking up. Mr. Bassford's example of Lizzie L. and Oriva is not good comparison. The Lizzie, being much the smaller of the two, simply found the wind stronger in proportion to her size than Oriva. Had the test been made between two boats of about like size, but differing in displacement, as in many of the official races, his inferences would have been sounder. Did Mr. Bassford see Oriva tan the famous Vixen out of sight in the light wind of the second Seawanhaka Corinthian match last year? That is an offset at once to his own particular observation; and how does Mr. Bassford know what were the intentions of those aboard the Oriva when he met her in the Lizzie? His conclusions are much too hasty, made upon trivial evidence, and in contradiction to the much broader field afforded on the past seasons as a whole have afforded. Beyond this we do not care to refer to our correspondent's letter. For all the other points he brings up answers can be found by the ream throughout our files for five years. The subject has been thrashed so bare that we cannot publish any further reiterations of the issue. It must be as consoling to Mr. Bassford to know that his ideas of more depth and many other cutter attributes, to which he has so long been favorably inclined, are now being generally followed, as it is to us to see our whole fleet approaching step by step to the highest ideal of naval architecture, the well-planned, well-proportioned, well-built and well-equipped cutter.]

THETIS.—The Boston *Courier* has the following concerning this new compromise between cutter and sloop: "The yacht Thetis, now building by Smith, of City Point, for Mr. Harry Bryant, will spread about 3,000 yards of canvas. Her mast will be 61ft. from deck to topmast, and topmast will be 45ft. Main boom 60ft., gaff 36ft., leech of mainsail 72ft., jibstay 72ft., and forestay 58ft. Her topsail will have a 45ft. pole for racing, and 30ft. 6in. for working sail. Jib 40ft.; 50ft. from mast to end of bowsprit, with 28ft. outboard. All told she will have mainsail, jib, 2 jibtopsails, 2 gaff topsails, fore staysail with a spinnaker, with 100ft. on outer leech, 97ft. on inner leech with 72ft. pole, 550yds. of canvas. The dimensions of the Thetis are: 70ft. over all, 64ft. water line, beam 19ft., draft without board 8ft., with board 18ft.; displacement 66 tons, 15 tons lead on keel. In model she is similar to the Shadow, owned by Mr. Bryant's brother, but has less beam and greater depth. Her frame is of oak, 4in. sided and moulded, 6in. at keel and 4in. at head. Plate timbers in one length, 15ft. long by 8in.; floors of wrought iron 5½x¾in., with arms 4ft. long. She is a compromise, narrower than any other sloop; weight on keel greater than on any yacht of same length, and draft greater perhaps than any keel boat of American design."

SEAWANHAKA CORINTHIAN Y. C.—There is a chance of settling upon four or more dates for special races among the fourth class cabin yachts of the club, course to be triangular in New York harbor. A steam yacht has been tendered by the commodore as committee boat. This plan is most commendable, and we hope before long to see such matches fixed for every month from May to November. The expense would be nominal only, and the biggest score for the season could be rewarded with a championship emblem or pennant.

MEASUREMENT.—A gentleman writes he is sorry we have given up bulk measurement. We have not given it up, but recognize that with the prevailing want of knowledge, it is no use trying to push what people are not yet able to contemplate from a philosophical point, and that the best way to have a bad law repealed is to enforce it. By the way, what has become of measurement and the America Cup since FOREST AND STREAM dropped them? Our contemporaries dried up wonderfully quick.

THE FISHING FLEET, TOO.—The move for greater depth and less beam to the Gloucester fishing fleet appears to be gathering force. That some change ought to be made to prevent the frequent disasters by capsizing, all hands are agreed. In spite of the adulation bestowed upon the fishing fleet, there is vast room for improvement in their models and rig in the light of modern knowledge of naval architecture.

SALEM BAY Y. C.—Officers for the year: Commodore, Willard Winslow; Vice-Commodore, G. W. Mansfield; Rear Commodore, Gordon Dexter; Secretary, Robin Damon. Regatta Committee—John Newcomb, W. Winslow, H. A. Brooks, A. M. Liebsch, G. W. Mansfield. The club has voted to join the New England Yacht Racing Association, and has appointed G. W. Mansfield as its delegate.

THE IELEN.—This is the name of the new schooner built by Alonzo Smith, of Islip, for Mr. Middleton, of Philadelphia. She is 70ft. over all, 62ft. water line, 21ft. beam and 5ft. 6in. draft, without board. Mainmast, 83ft.; foremast, 61ft.; mainboom, 44ft.; gaff, 25ft.; foreboom, 31ft.; gaff, 20ft.; topmasts, 30 and 29ft.; bowsprit outboard, 20ft.; jibnoom beyond cap, 16ft.

SLOWLY WAKING UP.—The influence of FOREST AND STREAM upon its minor contemporaries is great. It has moved one of its little friends to boldly declare for racing at sea, though the same little bantling hitherto fought the idea tooth and nail, so far as bantlings can fight. They will get to cruising outside by-and-by, as fast as a new idea can percolate castiron.

THE PROSPECTIVE MATCH.—Series of races between Ileen and Hildegarde have been arranged subject to acceptance of Mr. Padelford. Mr. Wm. E. Iselin backs Ileen for $1,000. Seawanhaka Corinthian Y. C. rules. The match will cause great interest, as upon the result hinges the construction of some new cutters like Ileen.

REAL YACHTING.—The Meta, 374ft. long, is bound on a cruise to Norfolk the latter part of April, with her owner, Mr. Suydam, and Mr. Franklyn Bassford, the marine artist. The Meta will receive double head rig, and with companion made watertight, ought to prove equal to the occasion with her 5ft. of draft.

ANNASONA.—This clipper has topped her boom for the Mediterranean. She sailed from Cowes Feb. 27, bound for the big bag of ducats waiting to be scooped in the Nice international. It will be a very funny day if Annasona does not land the riches.

FORTUNA.—Mr. A. Cary Smith is authorized to deny the untruths circulated concerning Fortuna's behavior at sea. She did not strain or leak, and proved a grand sea boat under circumstances which a centerboard would scarcely have outlived.

MURIEL.—This cutter has been purchased by Mr. Paul Tuckerman to Mr. Charles A. Robbins, S. C. Y. C.; so she remains in the squadron.

NAMOUNA—was expected at Nice about March 20, with the Commodore's burgee of the N. Y. Y. C. at the main.

SURF.—This cutter is fitting out at Bay Ridge. She will be one of the early birds off for an April cruise.

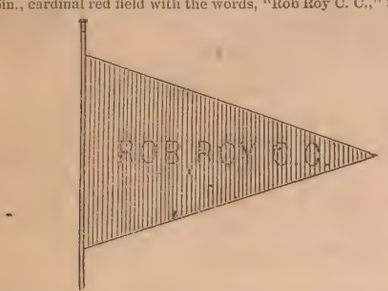
TRITON.—This schooner has become the property of Mr. Henry E. Dodge, Seawanhaka Corinthian Y. C.

SEAWANHAKA CORINTHIAN Y. C.—Annual club dinner at Delmonico's to-night at 7 P. M.

DAUNTLESS—Left Marseilles for Villefranche Feb. 29, and was expected at Nice March 3.

MONTAUK.—This schooner arrived at St. Pierre, Martinique, March 19, from St. Kitts.

LAKE Y. R. A.—Meeting has been called for March 29 at Toronto.



Canoeing.

FIXTURES.

Winter Camp-fire.—Sixth meeting, Wednesday, April 2, 8 P. M., No. 23 East Fourteenth street.

ROB ROY C. C. OF INDIANAPOLIS.

ORGANIZED June, 1883, with twenty members. J. B. Morrison, Commodore; L. M. Vance, Vice-Commodore; Frank Vater, Keeper of the Log and Treasurer; Signal, a pointed burgee 10in.x 15in., cardinal red field with the words, "Rob Roy C. C.," in letters of

gold thereon. The club is governed by six standing committees of three members each, appointed by the commodore at the annual meeting of the club. The committees are: Financial Committee, Inspection Committee, Entertainment Committee, Regatta and Race Committee, Cruising Committee, Membership Committee. A series of meetings is now being held once every two weeks, for the purpose of discussing matters relating to canoeing.

LOCAL CANOE MEETS.

IT will be seen, by a notice in another column, that the Whitehall C. C. have already taken action to arrange for a local meet next summer at Lake George, in connection with the Lake George C. C.; canoeists about New York and the Hudson are ready for a meet at Newburgh on May 30, and the Hartford and Springfield clubs will unite with other neighboring canoeists at some point on the Connecticut on the same date, and several Eastern canoeists have proposed a meet in June on the Merrimack River.

While there are a number of canoeists in New England, they are not united, there are but few clubs, and some such movement as this is necessary to awaken them and draw them together. The Vesper Boat Club, of Lowell, has a number of canoeists among its members, and some of these are ready to start the movement. It is proposed to hold a camp between Lowell and Lawrence, where there are many beautiful sites. Canoeists can center at the former place, paddling down to the camp, continuing later to Lawrence, Haverhill 18 miles, or Newbury port, 36 miles. The Boston & Lowell and Boston & Maine railroads can be taken from Lowell and Lawrence to all parts of New England. The expenses of such a meet would be very small, rates could probably be arranged with the railroads, a few tents could could be hired for those who were unprovided, and the canoeists would need about three days' rations each while in camp. Canoeists throughout New England who favor the scheme are requested to write to FOREST AND STREAM, making any suggestions that may occur to them. For the first year racing may well be omitted, the main object being to promote unity and sociability among canoeists.

With these four meets the East is well provided for, but there are many canoeists west of Pittsburgh who cannot attend the A. C. A. or local meets, and it is highly desirable that they also should unite in some central spot, and we shall be glad to hear also from their representatives. With them it is more important than in the East, as canoeists there will attend the A. C. A. meet, while they cannot do so on account of distance.

Canada also remains to be heard from. Do not all who were present last year wish to go to Stony Lake again on Dominion Day?

Such meetings all over the country can accomplish work that the A. C. A. cannot do in arousing local interest, making converts among boating men and campers out, and increasing the spread of canoeing generally.

THE ALL-AROUND CANOE.

WHAT is the best all-around canoe? Is it the canoe that will just suit everybody for everywhere and everything? If so, it will never be built.

I am very much interested in the canoe articles published in FOREST AND STREAM.

First—Because I am an old woodsman, having taken my first lessons in canoeing in a heavy, cranky dug-out, or the still more tickish spruce bark canoe, where it was necessary to be constantly on guard in fishing and in shooting, lest, when a big one bit and you struck him hard, or when perhaps your chum had put a couple of drams too much powder in the old muzzleloader just to see it kick you, some careless movement should spill you out into four feet of water and ten more of soft mud, I can therefore appreciate the light, steady, beautiful craft of to-day.

Second—Because I am a builder of these modern canoes. It is as a builder that I have studied the points and obtained the information which enables me to speak understandingly on this subject. My correspondence numbers about five thousand letters per year; of this number several hundred go into details, describing "the canoe I want" or "the boats used in this locality." Some contain absurdities, some theories, and some sound information and practical advice. Thus it will be seen that the professional builder has not only his own ideas and experience, but those of hundreds of others, and he is constantly trying experiments either on his own account or in building to order.

He builds a 10ft. 6in.x26in. canoe weighing 15 to 20 pounds for a "Nessmuk," and is told that it is the perfect canoe. He builds an 18ft. x35½ft. sneakbox for "Bojum," and that is the thing. He builds a Stella Maris for the river cruiser, and a 15x31 Princess or larger Pearl for the seaboard, and both suit.

"Nessmuk" is a light-weight veteran well versed in "woodcraft," as many of the readers of the FOREST AND STREAM well know, and his 20-pound canoe is ample for him, while a 10-pound one will do very well.

Mr. C., inspired by the interesting articles written over the signature "Nessmuk," wants a canoe just like his, or perhaps wants to outdo him by getting one 8 or 9ft. feet long. He gets it and finds it practically useless. Why? Because Mr. C. is six feet tall, weighs two hundred pounds, and is stiff and clumsy. He should have taken one 13ft.x30in. at least, or if for sailing, the 18x3½ sneakbox. Mr. D. wants a boat. He is not over strong, light weight, and a little timid. He tries the sneakbox but finds it too large, heavy, and to a certain extent unmanageable. He should have taken a light, open canoe, the Stella Maris, or at most the 14x30 Shadow or Princess.

In naming the best all-around canoe, there are too many things to be considered to have any one craft fill the bill. First, the boat must fit the purchaser's eye. Mind, I say his eye, not yours or mine. We must suit the mental canoeist. Second, we must fit the physical canoeist. That, you will say, is easy; a simple problem in weights and measures. True, if you take care of that other fellow, the mental man; but if you don't, it is about even chances that the mind will insist on cramming the body into a craft but half large enough, or else compel weak and untrained muscles to do the proper work of an athlete. Third, we must consider where the boat is to be used.

The Stella Maris can cruise from Labrador to Cape Cod, and the sneakbox can explore the waters of the upper Hudson; but if the owners of these respective boats contemplate such cruises they would find it advantageous to swap.

For the canoeist of medium weight, for inland cruising, where the paddle is used as much as the sail, and where supplies may be procured easily and often, a canoe 11ft.x26in. or 27in. is the best all-around canoe. For the canoeist of heavy weight, one 14ft.x30in. would be better for the same purpose. For lakes many miles in extent or the seaboard, a canoe 14ft.x33in. is thought small enough, and many would prefer 15ft.x31in., or even larger. If compelled to adopt one size for all men, all places and all purposes, there is no question but that the 14ft.x30in. or 31in. would be the best all-around canoe. Happily, however, the canoeist may suit himself from among the many sizes, models and builders.

I may say in conclusion that I build more canoes either 14ft.x27in., or under, than all others. Probably because there are so many more miles of inland waters than seaboard. RUSHTON.

BOATING TRIPS ON NEW ENGLAND RIVERS.

THE canoeist who reads Mr. Fellows' interesting little book will wonder why he did not choose a canoe for such work, and will feel a desire to convert him from the oar to the paddle. The trips described were made on the Nashua, Housatonic, Sudbury, Concord and Merrimac rivers, and were of that sort most enjoyable to the true canoeist, the lazy loitering on narrow streams, camps in quiet nooks, continual surprises, obstacles to overcome in the shape of dams and shallows, excursions on shore to visit points of interest, and with sufficient work in rapids to give occasional excitement, in fact the cruising described by MacGregor, and for which no boat is so well suited as his Rob Roy. Mr. Fellows seems to have been unfortunate in his craft, owing to the leakage, and his experiences with railways and express companies will awaken the sympathies of many canoeists who have suffered similarly. Without falling into a mere list of stopping places and obstructions, or impairing its interest, minute details are given concerning the waters traversed, and it will prove an accurate pilot to all following the same course, as maps are given of all the rivers mentioned. We hope that when Mr. Fellows next goes afloat it may be in a canoe, and that we can welcome him some day under the A. C. A. flag, for in spite of the heterodox oars on the cover, his book is worthy of a place in every canoeist's library.

ENGLISH AND AMERICAN CANOEING.

IT might indeed be possible to fix to a date when the first canoe club was started in America, and also to record the names of those who took part in the organizing of clubs. Boating in various degrees dates back many years; for instance, to Noah, who built his ark to very correct nautical proportions. But the birth of canoeing in these times dates back to the day when McGregor first stepped into his Rob Roy.

Yet there are many who "canoed" long before the Rob Roy was thought of; who paddled around in birchbarks, presumably for hunting purposes first, and occasionally for the pure love of being on the water. These old stagers no doubt took up the idea when it came over, and possibly such an old hand as "Nessmuk" may have been the first to have a canoe built and covered in with a wooden deck. It is easy to see that a sail would soon follow. Two or three companions become interested, and after, say, one season's desultory drifting around a club is formed, and clubs beget clubs.

Let us take a trip across to the old country for a few hours and visit some of the clubs there. The Royal C. C. has a membership of over 600. Now, one would imagine that there must be at least 50 per cent. of that 600 sufficiently enthusiastic to turn out for the challenge cup race; but, with its members scattered over a large area, and no central club house, is it any wonder that there are not more than, say, one dozen who turn out for the cup? The cup course at Hendon, too, is like—what it really is—a fish pond in very confined limits. Yet, to make all allowances, where could the Royal C. C. find a more suitable place?

Some of the R. C. C. branches are more happily situated for a large entry at races. The Cambridge branch had eleven entries for a quarter mile race in '67, and on no occasion is there any record of two and one-half per cent. of the membership entering for the cup. Why?

Since we are in England let us visit other clubs. The eastern branch of the R. C. C. at Hull has a fairish cruising ground, though awkwardly hampered by mud and sand banks. It has a few active and enthusiastic members and a fair membership, but its percentage is similar to the parent club. The northern branch, or now the Mersey C. C., is still better situated, and evidently more enthusiastic as to entries for races. Go further north a couple of hundred miles and visit the Clyde and Forth C. C. The Forth C. C. is conveniently situated, but rather exposed to south and southerly winds. It has a fair membership and an extra average of interested members.

Go 'cross country and visit the Clyde. This club has the finest, loveliest and most romantic situation anywhere. Its club house is only a few yards from the sea even at low water. It has a most sheltered launching slip, a pretty fair membership, and a very high percentage of active members. With a roll of about thirty-five, it is not uncommon for 10 or 12 to go off on a cruise together or enter for a race. Records are in existence of an attempt to get up an international canoe club cruise, at which not more than eight took part in. Now let us return to the States.

There is a man in America by name of Bishop who took a leading part in getting up an international canoe club cruise, and remark the result—twenty-three canoeists meet at Lake George and organize in 1880. At the last meet of this Association there were something like forty prizes raced for, with as many entries as ten for a single race from an attendance of 300 canoeists. English canoeists seem afraid to take their canoes, say 50 or 100 miles, to attend a meet, while here an average American canoeist thinks no more of going, canoe and all, 600 miles or more for a "meet" of three days' duration. But, hold, we forgot.

There is one English canoeist, to wit, C. W Bush, of the Royal C. C. and the Mersey C. C., who took his canoe to Canada with him. Three cheers for Bush—a man among men. It is doubtful if he would have done so had he not been a Mersey man; but where would a Mersey man not go?

Now what is the result of the institution of the A. C. A.? A healthy growth of canoe clubs all over the States, from Cape Cod to the Golden Horn, from Key West to the St. Lawrence, including of course our good friends the Canadians.

To be a member of a canoe club is no mean attainment. Their doors are not open to everybody, and a would-be member requires certain attributes to recommend him to membership. Then again, there is the club house; and how different from clubs usually called "the club." You cannot buy a drink or a smoke in any of our clubs. You don't find any signs of intoxication, unless it be the effects of exhilaration on the water. There is no dawdling around the club room, but a sprightly hurry to get afloat and away, or a very possible and probable dissertation and explanation on a new kink in a rope or a wrinkle in a sail. You ask did I say healthy? Of course it is, and for proof look at the boys: speak to them, walk or paddle with them, eat with them, and then hear them snore!

Then again, apart from clubs, there are the new winter cruises now becoming popular (like an epidemic) all over the country. The winter camp-fires are certainly the most enjoyable and remunerative way of investing the fly about dollar that could be instituted.

But who else is benefited? Why, canoe builders, who, were it not for canoeing, would have possibly not been so well known. There's Rushton, Smith, James, Waters, Herald, Rogers, and a host of well-known names, who send, or rather give, their help to the ever-growing cause, and who could tell an interesting tale about "how they commenced to build," were they only to take the trouble. But they have not time. You boys all keep them too busy building. WREN.

CANOE VS. SNEAKBOX.

Editor Forest and Stream:

The owner of "Bojum's" old canoe is quite right in declaring for the canoe as a cruising boat. Nobody claims the sneakbox to be better as an all-round boat. Were I to cruise from the headwaters of the Potomac to Point Lookout, on Chesapeake Bay, I should use a canoe, for it could be easily carried around the falls of the upper river, would be pleasanter to paddle along the stretches of smooth water above Washington, and carefully handled, could be sailed with safety where the Potomac is from five to ten miles in width, although it would perhaps be a little wet when a heavy sea was on.

But if I were to cruise from this city down the Potomac and explore the length and breadth of the Chesapeake as well, I should use the sneakbox. When you say that "a boat of 18x5½ft. is larger and should carry more, sail faster and be stiffer than one of 14x2½ft.," you state the very reason why the box is superior for wide waters. "Boats of the same size" cannot be considered in the sneakbox-canoe question, for when you decrease the box's beam to that of the canoe the former is no longer a sneakbox. There used to be a 12½ft. sneakbox somewhere around New York owned by "Snark," and if he has it yet I presume he would accommodate Dr. Neidé with a race from Throgg's Neck or Flushing to New Haven, or perhaps even to Montauk; but the editor surely wouldn't expect "Snark's" 4ft. of beam to be reduced to the dimensions of that of the doctor's canoe. I admit that the merits of the two boats could be thoroughly tested by cruising together, but not that racing together would be a fair test, unless several races were had under various conditions of wind and water, current, tide, etc., and "a little wind and water" won't settle the question either. Mr. Editor, for on the wide waters where we put our trust in the sneakbox there is always a good deal of wind. Has Dr. Neidé ever made a practical test of the sneakbox on wide waters like Ontario or any of the great lakes, Long Island Sound, South, Barnegat, Delaware or Chesapeake Bays? SENECA.

WASHINGTON, March 19.

[For a fair comparison of model it is necessary to consider boats of the same size, and if, for instance, the 18x5½ sneakbox be compared with an 18x3¼ canoe (the same proportions as a 14x30 canoe) there is no doubt as to the superiority of the latter on every point, except draft. This comparison would not be unfair, as the depth of one would offset the extra beam of the other, and similarly the Snark, 12½x4, would be well matched against a 15x31 canoe. Perhaps "Snark" can tell, from previous races, what chances the box would have in such a race. The following letter offers an opportunity to settle the question as far as it can be done by a single race. If the time and place mentioned are not convenient to Mr. Wild, no doubt a race could be arranged nearer home, say in New York Bay.]

A PROMPT ACCEPTANCE.

Editor Forest and Stream:

In reply to your correspondent, Geo. H. Wild, of Red Bank, in to-day's issue, I hereby offer to sail the canoe Guenn, 15ft.x31in., N. Y. C. C., at the Newburgh meet on Decoration Day against his 12.6x3.10 sneakbox. Race to be singlehanded. No shifting ballast—triangular course at least three miles. Sailing regulations of New York C. C. to govern match for a mug; or colors as may be preferred. Other entries permitted at $1 entrance fee.

NEW YORK, March 20. WM. WHITLOCK, Com. N.Y.C.C.

Editor Forest and Stream:

As to the sneakbox vs. canoe I am decidedly of the opinion, as "Bojum" says, that a sneakbox will drown out any other boat of her inches. I have seen them cross our bay to windward when a 20ft. catboat dare not show her nose out of harbor. The bay is five miles wide, and with a norwester there is considerable sea. E. B P.

TOMS RIVER, N. J.

KNICKERBOCKER C. C.

Editor Forest and Stream:

The Knickerbocker C. C. intend removing from their present location at the foot of Eighty-sixth street on or about the 1st of May next. Their house has long been inconveniently small in proportion to their number, and for nearly twelve months they have been considering the advisability of securing enlarged quarters. They have finally succeeded in obtaining the house belonging to the late Resolute Boat Club, at the foot of 152d street on the Hudson River. The building is large and commodious, capable of accommodating fifty canoes, with a large upper meeting room, and is well supplied with racks, lockers, closets and other conveniences. The original cost of the erection was in the neighborhood of $2,200.

By private subscription among the members the purchase money has been raised, and we shall be enabled to enter it in May without one cent remaining due and with all the preliminary expenses of painting, fitting up, etc., paid for in full. It is situated in a sheltered nook on one of the broadest and most beautiful parts of the Hudson. In the neighborhood are many points of interest to the lover of the picturesque and the commanding site of the spot renders it peculiarly adapted to club meets and regattas.

The Knickerbocker C. C. is in a most prosperous and promising condition. It numbers twenty-seven active members, with thirty-six canoes. Many new boats are being built, and the universal activity and interest displayed in regard to better models, new centerboards, improved sailing rigs, unheard of camping kits, and phenomenal water-tights promises a vigorous and enthusiastic summer campaign. We hope to send a fair representation to our coming local meet, and believe the blue diamond on its red field will float from many a masthead this autumn at the Thousand Island. The club has lately been duly incorporated under the State Laws of New York, the board of trustees for the present year being the lately elected officers: Messrs. Brentano, Greenleaf, Martin, Sullivan and Fowler.

We expect a large accession of new members as the season opens, many having expressed their desire to join us. We are one of the four oldest clubs in the United States, the second in size, and the second as a corporate body, but we trust to be second to none in the interest we feel in canoeing, and I may add, second to none in the hearty welcome we shall extend to brother canoeists and members of sister clubs who may visit us in our new home.

E. FOWLER, Sec'y K. C. C.

LARGE VS. SMALL CANOES.

Editor Forest and Stream:

A correspondent asks why the Stella Maris could not be built a little broader and deeper and remain about the same weight. Certainly. Every one knows that it is only the material that weighs, and it takes no more to build a house 30'x40 two stories high than another 20'x40 and one story high. A fat man will weigh no more than a lean one if their height be equal.

Seriously, however, if you add to the capacity of a canoe by adding to either length, depth or beam, you must increase the weight.

BUILDER.

VESPER BOAT CLUB.—The annual meeting of the Vesper Boat Club was held at the American House March 12, with a good attendance of members and Vice-President Harry A. Brown in the chair. Report of last meeting read and accepted. The treasurer's report followed, and showed the club to be in a highly satisfactory financial condition. Receipts for the year were $1,731.88: expenditures, $1,708.41, leaving a balance of $23.47. Canoeing is becoming a prominent feature of the club work, and with about twenty-five canoes in the boat house, it may be advisable to form a canoe division and open communication with the American Canoe Association. Officers were then elected, as follows: President, Paul Butler; Vice-Presidents, Harry A. Brown and Fred P. Marble; Secretary, Walter U. Lawson; Treasurer, Ralph F. Brazer; Directors, C. P. Nichols, A. G. Swapp and C. F. Edwards. Austin K. Chadwick and R. F. Hemenway were appointed a committee to draft resolutions of thanks to Mr. Knapp for his valuable gift. E. S. Sherman and W. P. Kennard were elected auditors. Adjourned.—*Lowell Courier.*

THE WARREN C. C. is now fully organized and ready for exercise and recreation. It members are: William Schnur, Captain; W. C. Warner, Mate; Willis Cowan, Purser; J. P. Jefferson, W. H. Johnson, J. A. Cadwallader, C. H. Noyes, Fred Morck, W. A. Greaves, B. Kittinger, W. A. Talbott, Ed. Wetmore. The club will be represented at the annual "meet" of the American Association at the Thousand Islands next August, and expects to increase its membership this summer.—*Warren (Pa.) Mail.*

WHITEHALL C. C.—At a special meeting of the Whitehall Canoe Club a committee, consisting of F. C. Cooke, W. W. Cooke, Jr., and E. A. Greenough, was appointed to make arrangements for a local meet on Lake George next summer. They will act in connection with the committee of the Lake George Canoe Club appointed for the same purpose.—HAWKEYE.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

W. M., Roslindale, Mass.—For full particulars address W. A. Stearns, Amherst, Mass.

R. C. H., Philadelphia, Pa.—Watch him and correct him every time that he commits the fault.

H. G., Rathrun, I. T.—What is the best work published on breaking a dog? Ans. "Training vs. Breaking," price $1. We can furnish it.

O. G. L., Comstock, Mich.—Would like the latest Michigan laws you can give. Ans. You will have to write to the Secretary of State for copies of bills.

J. B. W., Harrisburg, Pa.—We know of no maker of tubed shells, and presume that you would be obliged to have them specially manufactured for yourself.

S. H. F.—Do not think marine glue can be obtained in this country. Try the large paint and varnish dealers, Pierce or Raynor, Fulton street, or along South street.

J. S., Brooklyn.—Please let me know the address of some one that has game chickens for sale, also common pigeons. Ans. Write to J. & W. Van Wyck, New Hamburg, Dutchess county, N. Y.

F. R. H., Collingville, Conn.—What is the customasy way of choosing referees in gun clubs? Is it usual to choose them for the season or at each practice? Ans. Generally chosen for each match.

M. S. F.—Cost of single-hand yacht of 21ft. loadline, from $700 to $1,000, according to build and equipment. Fairly good boat of moderate type can be built for less if content with small outfit and plain finish.

CONSTANT READERS, Old Subscribers, True Sportsmen, and others, who forget to sign their names to their questions and communications are respectfully referred to the notice at the head of this column.

F. K., Holyoke, Mass.—In loading buckshot, is it right to place a wad between each layer of shot, or only one wad, the same as in ordinary loading? Ans. Either way will do. The first is said to be very good.

BLACK AND TAN, Dedham, Mass.—1. Farrar's Fan was by Dick and out of Thomas's Fan. 2. Grouse (E.K.C.S.B.) was by Rock and out of Floss. 3. There are ten volumes of the English Stud Book. The

second volume is out of print, you can procure the others and also the *Gazette* of the secretary, 6 Cleveland row, St. James, London, S. W.

J. C. F., Brooklyn.—Will you oblige several readers by telling what kind of fish, if any, are contained in Lake Ronconcoma, L. I.; what season is best, and what bait or fly to use? Ans. Black bass are the principal fish, the best season is June to October, and the baits and flies are the usual ones for that fish. There are other native fish in the lake, but not of much account.

SUB., Geneva, N. Y.—1. In a glass ball shoot say that A at 21yds. ties with B and C at 18yds. Do not they shoot off the tie at those distances? 2. Do not others in same contest, tieing for second and third prizes at 18yds., shoot off their ties at 21yds.? 1. The general practice is to fall back three yards in shooting off ties, but the handicap must be preserved. 2. Yes.

FOX, Corning, N. Y.—Can a cheap breechloading shotgun, having a side snap and single butt, be regarded as perfectly safe when using heavy charges? I have such a gun, stamped W. Richards, and, although it is sound and tight, I am afraid of the action. Ans. We should not be at all afraid to use it. But after all you do not tell us much about the gun. We presume it is safe.

COON SKIN, Sharon, Conn.—I have a very fine raccoon, lately caught in a steel trap. She is a very dark color, and I wish to tame her if I can, what shall I feed her and how shall I proceed to get her tame? Ans. A coon will eat anything—bread, meat, vegetables, etc. It will also steal all your eggs if it gets loose. We do not know how to go to work to tame it, though perhaps by patience it might be accomplished.

E. C. C., Westerly, R. I.—Please inform me if there is a Fish Commissioner in Rhode Island, if not how could I get a few thousand trout fry gratis, for stocking the brooks in my neighborhood? Ans. The Fish Commissioners of Rhode Island are: John H. Bardwell, Rockland; Henry T. Root, Providence; Col. Amos Sherman, Woonsocket. If they cannot furnish you trout consult our advertising columns.

W. A. W., Bridgeport, Cal.—1. The word "charge," as used by sportsmenn, means to drop or lie down. 2. The term "bye," used in connection with field trials, signifies that the dog to which it is applied wins his heat without running for it. For instance, supposing that there are nine dogs to run. Their names are drawn in pairs, and the last name drawn, having no competitor, is entitled to his heat just the same as though there had been ten dogs and he had beaten the one drawn against him; or in other words, a "bye."

IDLEWILD, New Castle, Del.—1. Is a .32-caliber, Remington 7½ pounds rifle, a good one for squirrel shooting? 2. What length of barrel would you advise me to get, 26, 28 or 30? 3. About what distance will they kill? 4. What price photographic outfit was it you used from the windows of your office some time ago, of which you mentioned in your editorial columns? 5. Are the $10 outfits of any account? 6. How long does it take to complete a picture? Ans. 1. Yes. 2. It is a matter of individual fancy; we should choose 28in. 3. About 100 yards. 4. $35. 5. Yes, but not a fine lens. 6. To expose, develop and print about two hours.

A. C., Marblehead, Mass.—My best sport is fishing, but the only kind of fish I ever catch are mackerel, cod, pollock and cunner, as they call them. Please inform me what the names of these fish are. I mean what you would call them. 2. What other kind of fish ought I to catch? There is one man that catches one bass or two a summer, but he is the only one I ever knew who ever caught any. 3. What kind of a fish do you call trout? Are they salt-water fish? 4. What kind of fish do you catch with those kind of hooks that you don't have to bait? 5. What time of year do bluefish get here in Massachusetts Bay? Ans. 1. The fishes are named correctly, and we would call them as you do. The cunner is called "bergall" in and about New York, but cunner is just as correct. 2. Catch such other fish as are in your vicinity or go to other places. 3. The trout is a fresh-water fish of the salmon family, inhabiting cold spring streams. 4. Trout, black bass and perch. As a rule salt-water fish do not rise to the fly. 5. Latter part of June and July. They leave in October.

A. B. D., New Hampshire.—Is there any solution of the following lines from "Secrets of Angling," 1613:

"Take gum of life, fine beat and laid in soak
In oyle well drawn from that which kills the oak"?

Also, can you give me directions for making the paste bait used in catching perch? Ans. We have not the slightest idea what drug was meant by "gum of life" in 1613; "that which kills the oak" may mean ivy. The meaning is evidently hidden in the form of an enigma to stimulate guessing. Perhaps some of our readers may know the meaning. Walton says, Chap. VIII.:

"Dissolve gum of ivy in oil of spike,
And therewith annoint your dead bait for a pike."

Again, speaking of scents for baits, Chap. XI., he says: "Did I know any such secret I would not use it myself, and, therefore, would not teach it you. Though I will not deny to you that, in my younger days, I have made a trial of oil of osprey, oil of ivy, camphor, assafœtida, juice of nettles, and several other devices that I was taught by several anglers I met with, but could never find any advantage by them." See also Chap. XVII. These things are not in use now, and we only know of them by reading. Pastes are in the same category. There are no better baits for perch than minnows and worms.

PUBLISHER'S DEPARTMENT.

THE Perfection cartridge loader appears to possess the merits of simplicity and ease of manipulation. It is stated that with it five shells can be loaded in a minute. Such a tool cannot fail to find many buyers among shooters. It is manufactured by the Perfection Cartridge Company, Cincinnati, O.—*Adv.*

ABBEY & IMBRIE,

Manufacturers of Fine Fishing Tackle

48 and 50 Maiden Lane, New York City.

We beg to call attention to our new 120-page folio Illustrated Catalogue. We have spared neither labor nor expense in our effort to make this the most complete work of its kind. We will send a copy, postpaid, on receipt of 50 cents, which price does not nearly reimburse us for its cost.

TRADE MARK

FOREST AND STREAM: "The list is surprising, even to one familiar with such matters. The great merit of this catalogue is its accuracy."

AMERICAN ANGLER: "It is, without doubt, one of the most complete and elaborately illustrated catalogues that has ever been issued in the interest of a private firm. This catalogue may be classed as a *text book*, owing to its practical value to the general angler."

NEW YORK EVENING POST: "The amount of ingenuity exercised in devising means to capture fish becomes apparent only upon study of such a catalogue of fishing tackle as Abbey & Imbrie, of New York, have just published."

SCIENTIFIC AMERICAN: "The book has 92 large plates, covering almost every conceivable appliance in this line, and in such profusion of styles as would probably delight even our most expert of fishermen, President Arthur."

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

Antelope and Deer of America.

—BY—

JOHN DEAN CATON, LL.D.

This work is the most important publication ever printed on the subject.

The subject is a capital one. These animals are the most interesting of all our American game.

It takes a deer hunter to write of deer; and he must bring to the work the same enthusiasm that prompts him to carry the rifle day in and day out in pursuit of the game. There is no need of Judge Caton's telling us in the preface that deer hunting has always been his favorite diversion, for the reading of his book shows us that.

The characteristic of the book is that it is, all the way through, a statement of facts which have been learned by the most patient and industrious study of these animals. Judge Caton has for many years kept in domestication the American antelope and all of the American deer, save the moose and the two species of the caribou. The chapters are devoted to the following: The Antelope, Moose, Elk, Woodland Caribou, Reindeer, Mule Deer, Columbia Black-tailed Deer, Virginia Deer, Barren-ground Caribou, Reindeer, Acapulco Deer.

"The Antelope and Deer of America" is a large volume of 426 pages, illustrated with more than fifty illustrations (most of them from photographs), bound in cloth. The former publishers sold the book for $4.00.

We have reduced the price from $4 to $2.50.

Forest and Stream Publishing Co., 39 Park Row, New York.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, APRIL 3, 1884.

VOL. XXII.—No. 10. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

IN APRIL.

THE Ram makes way for the Bull; March goes out and April comes in with sunshine and showers, smiles and tears. The sportsman has his gun in hand again with deadly purpose, as the angler his rod and tackle with another intention than mere overhauling and putting to rights. The smiles of April are for them.

The geese come wedging their way northward; the ducks awaken the silent marshes with the whistle of their pinions; the snipe come in pairs and whisps to the thawing bogs—all on their way to breeding grounds and summer homes. The tears of April are for them, for wherever they stop for a day's or an hour's rest, and a little food to strengthen and hearten them for their long journey, the deadly, frightful gun awaits to kill, maim or terrify, more merciless than all the ills that nature inflicts in her unkindest moods.

Year after year men go on making laws and crying for more, to protect these fowl in summer, but in spring, when as much as ever they need protection, the hand of man is ruthlessly against them.

When you made that splendid shot last night in the latest gloaming that would show you the sight of your gun, and cut down that ancient goose, tougher than the leather of your gun-case, and almost as edible, of how many well-grown young geese of next November did you cheat yourself, or some one else of the brotherhood?

When from the puddle, where they were bathing their tired wings, sipping the nectar of muddy water and nibbling the budding leaves of water weeds, you started that pair of ducks yesterday, and were so proud of tumbling them down right and left, you killed many more than you saw then; many that you might have seen next fall.

When the sun was shining down so warm upon the steaming earth that the robins and bluebirds sang May songs, those were very good shots you made, killing ten snipe straight and clean, and—they were very bad shots. For in November the ten might have been four times ten fat and lusty, lazy fellows, boring the oozy margins of these same pools where the frogs are croaking and the toads are singing to-day.

"Well, it's a long time to wait from November till the earth ripens and browns to autumn again. Life is short and shooting days are few at most. Let us shoot our goose while we may, though she would lay a golden egg by and by."

Farmers do not kill their breeding ewes in March, nor butcher cows that are to calve in a month; it does not pay. Why should sportsmen be less provident of the stock they prize so dearly; stock that has so few care-takers, so many enemies? Certainly, it does not pay in the long run.

PROPOSED ZOOLOGICAL GARDEN.

THE suggestion that a zoological garden be established in the Yellowstone National Park is one which deserves careful consideration. Practically, if the law is enforced, the Park is already a great zoological garden, a place where the observer can go and study wild animals in a state of nature. But, if we understand it, Mr. Talbot's plan looks toward the capture and keeping under close surveillance the species which he mentions. This is something that can be readily done, but it is perhaps open to question whether it is at present desirable to do it.

The people now feel that they have got hold of their Park, having wrested it from the grasp of a lot of greedy speculators, and the first thing that they desire is to see that it is properly protected and cared for. That it will be subsequently improved, we do not doubt, though we hope this improvement will never take the shape of anything like landscape gardening. The project suggested by Mr. Talbot will bear discussion, and we shall be glad to have our readers' views on it.

In the list of species of animals stated to be found in the Park the caribou is given, and we should be glad to learn if any of our readers have any knowledge of that species occurring in this region. That it is found a little further west and north is well known, but has it ever been killed in the Park? The moose is fairly common there.

A PLEASANT LETTER.—Such epistles as the one printed below are very grateful to the editorial heart, for it is no small thing after all to feel that by our efforts we help to give pleasure, such as that mentioned by our kindly correspondent.

MARCH 29, 1884.—*Editor Forest and Stream*: Your favor of the 27th is received, and I wish to assure you that anything I send for the paper can take its turn either into the columns of FOREST AND STREAM or into the waste basket, and in your own good time. Of course we all like to appear in the paper, but all correspondents should have sense enough to know that they cannot all be first. The paper is most excellent, and improves all the time, and its arrival in my family from week to week, is looked upon as an important event. All of us read it, and my sons, the daughter and their mother scan its columns with ever increasing interest. My own life is one of study, care and labor, and that paper has afforded me more *genuine relaxation* than all other publications that reach me put together, and I am greatly indebted. I have made the rifle a sort of hobby for many years, and have acquired most valuable information from the pages of FOREST AND STREAM all along. This afternoon I have been out practicing at 200 yards, and came in very much elated; as I made six successive shots at that distance from a sitting position—using a coarse hunting sight on the muzzle and Lyman rear sight—and put them all into a three-inch ring. This with a 50-cal. Maynard, 24-inch barrel. I used a new cartridge of my own make, and have something of interest to write about some of these days, unless I find I am mistaken in some way. ——

FISH AND GAME PROTECTION seems to be rapidly gaining in popular favor in Boston, if not all over Massachusetts. The new game bill reported to the Legislature is received with more favor than its warmest friends dared to hope, and appears to be sure of a passage without essential modifications from the draft already reported in these columns, unless some unforeseen difficulty arises. There is a change of sentiment even among marketmen—the best of them. One of them, a gentleman of integrity, remarked to the president of the Massachusetts Fish and Game Protective Association the other day, that if the new game bill passed it would ruin his business. The bill was fully explained to him in all its bearings. He heard it through, owned squarely that he had been mistaken, and wound up with desiring to be proposed as a member of the Fish and Game Protective Association. He will be received gladly, and christened as another friend of the good work. Boston is going to get rid of the name which has been put upon her of being the "dumping ground" of all the illegal fish and game of the country.

WHAT IS THE USE?

WHAT is the use in legislatures enacting laws for the protection of fish and game if those laws are not enforced? What is the use in the appointment of game constables, who are laggards in the performance of their duties and perhaps wink at violations of the laws, which it is their special office to enforce? What is the use in the formation of fish and game protective associations, which are not protectors of fish and game, and whose only business is eating and drinking and shooting glass balls and pigeons of flesh or clay? What is the use in two or three earnest men bestirring themselves to organize a club which starts with the honest intention of enforcing protection, when none of the twenty or thirty or fifty members besides themselves will do aught but sit still and grumble at what is done by them, and tell what should be done, what they would do! Well may these faithful few ask this question; when their associates, after the first warmth of the club's new life has vapored itself away, grow cold and stand aloof, never helping, but ever finding fault, and perhaps are known to break the laws which simply as good citizens they are bound to abide by, and have also given their word of honor to uphold.

Laws unenforced are worse than no laws, and worse than useless; so are unfaithful officers, and so are societies living only in name, and so are cold or only lukewarm members of societies, from which the living spirit has not entirely departed, and pretenders and hypocrites ten times worse. But it is always of use to urge the enforcement of good laws, the appointment of faithful officers to back them with aid and sympathy, to believe that laws were made for our observance as well as that of others, to endeavor to arouse the apathetic and instruct the ignorant, always of use to preach earnestly, and above all to practice as faithfully as we preach earnestly.

Preach to all men, practice, *practice*, PRACTICE! whether the eyes of men be upon you or not.

A SUMMER TRAMP IN THE ADIRONDACKS.—The annual "summer tramp" of Professor Jordan and party will be in the Adirondacks this year, instead of in Europe. These "tramps" are organized to combine pleasure with the study of natural history, and have been successfully conducted for the past three years. The circular says: "The total distance traversed on foot will be about 300 miles, the itinerary depending somewhat on the desires of the party and on the condition of the weather. The number of members of the party will be limited to about fifteen. The total expenses (from Fort Ticonderoga) will not vary far from $65. This includes a director's fee of $15. This tour is designed especially for those who enjoy walking and find pleasure in woods and rocks, and who are willing in some degree to 'rough it' for the sake of being brought close to nature. Those who prefer hotel-parlors to mossy logs should not join us." The director is David S. Jordan, Profesoor of Biology in the Indian University, Bloomington, Ind., and his assistant is Cornelia M. Clapp, teacher of zoology at the Mount Holyoke Seminary. The party will meet at Fort Ticonderoga, June 28. Spending the Sabbath there, they will proceed on foot to Crown Point, Bulwagga Mountain, Moriah, Crowfoot Pond, Deadwater, Euba Mills, Bouquet River, Hunter's Pass, Chapel Pond, Roaring Brook, Noonmark Mountain, Keene Flats, Au Sable Ponds, Mount Marcy, Avalanche Lake, Calamity Pond, the Deserted Village, Indian Pass, Clear Pond, North Elba, John Brown's Grave, Lake Placid, Old White Face, Au Sable Chasm, Port Kent, and across Lake Champlain to Mount Mansfield and Camel's Hump; leaving the mountains July 28.

HENRY BAINBRIDGE, the senior partner of one of the most prominent wholesale stationery firms of this city, died at his residence, No. 76 Lefferts place, Brooklyn, Saturday, March 29. Mr. Bainbridge was a genial hearted and social man, and was held in high esteem by his extensive circle of business associates and friends. One of his most marked characteristics was a genuine love of truth for its own sake—a keen sense of honor. He was an enthusiastic sportsman, and much of his leisure was devoted to his dogs and his guns. He was one of the earliest subscribers to FOREST AND STREAM, and even during his last illness looked forward to its weekly coming, as one of his friends says, "with singular eagerness." Mr. Bainbridge was a diffident and sensitive man, but greatly beloved by those who knew him intimately. He leaves a widow and two daughters, one of whom is the wife of Col. I. M. Faville. His funeral was very largely attended, from St. Luke's Episcopal Church Clinton avenue, Brooklyn, on Tuesday last, April 1.

THE LAKE YACHT RACING ASSOCIATION.

THE formation of an association by the yacht clubs on the chain of fresh-water lakes, is now an accomplished fact. At a spirited meeting held in Toronto, Saturday last, representatives from the principal clubs, both on the Canadian and American shores, drew up a constitution for the proper government of the new union. With the customs and laws of racing assimilated, a new era has opened for the prosperity of the sport. Through the adoption of the length and sail area rule of measurement, competition between the representatives of different types can now be undertaken with something like rational interpretation to the results. Individuals will not be forced into the construction of the largest sail carriers for the only purpose of racing, but can suit their preferences in all respects, and build to meet other requirements besides. The custom of making the rounds, which is the very life of match sailing, will now take a fresh hold upon lake yachtsmen, and the voyages and passages such undertaking entails, is certain to bring to the fore that boat best suited for the fresh-water seas. The constitution we will print in full next week with some further material bearing upon the subject.

"WOODCRAFT."

WE are pleased, but, we confess, not very much surprised, at the interest manifested by the general public in the little volume which we shall soon issue. Those who read it will find that it is very different from any book of the kind that they have ever seen. The striking feature of the book is that there is no waste about it, no writing to fill up, no padding. If the author had anything to say which did not teach some lesson he just left it out. Those who are familiar with "Nessmuk's" writings will understand that the style of the book is very attractive. Those who know that it is the outcome of fifty years' experience will understand that the book is replete with information. To give some notion of what may be found within its covers, let us quote from a letter received some time ago from the author. He says:

> And let me say that I have not tried to emulate Carlyle or Emerson in style. My purpose has been to make the book plain, simple and concise. Never to use three words or syllables where two will serve.
>
> To give such directions as will enable the average outer—
>
> To make his outing a pleasure instead of a misery, a comfort instead of a calamity;
>
> To sleep on a fragrant, elastic bed and pillow at night, instead of abrading his æsthetic vertebræ with roots and stubs;
>
> To go light;
>
> To keep warm and dry;
>
> To cook plain, wholesome meals;
>
> To come out of the woods refreshed and comforted;
>
> To get a dollar's worth of recreation and rest for every dollar spent;
>
> To learn Nature in her secret ways.
>
> To teach something of all this, "Woodcraft" is written.
>
> Let the great army of outers decide whether the book is worth taking into the woods. NESSMUK.

As he says, it is for the public to decide whether the author has accomplished his purpose. That we believe that he has done so goes without saying. "Woodcraft" will probably be issued in a week or ten days. The reader is referred to our advertising columns for further information.

The Sportsman Tourist.

MAJOR JOSEPH VERITY.

SOME OF HIS SPORTING ADVENTURES, AS MODESTLY SET FORTH BY HIS OWN HAND.

Chapter VIII.

SOMETHING which I hinted at in my last chapter I may as well enlarge somewhat upon now as at another time, and that is of the manner in which things, animate as well as inanimate, are drawn to one another. By some invisible impulse the polar bear and seal are drawn to frozen salt water, and seafowl to salt water unfrozen, just as strongly and surely as the needle to the pole, smoke to the sky, sparks toward their kindred, the stars, and water ever downward by some unseen power. Thus, also, according to my belief, by some intangible, ethereal attraction, and not, as commonly supposed, by a base, sanguinary desire, the hound is led toward the hare, the fox and the deer; the pointer, setter and spaniel drawn to game birds. For when each has come to his so-called prey, he is satisfied with merely mouthing it or smelling it, when each body becomes equally changed and the attraction ceases. This power of attraction acts on the dead dog, or part thereof, in proof of which fact I call to witness the undisputed account of a famous German baron concerning his jacket made of the skin of a celebrated pointer, which, when he wore it, always led him to game. For this reason, I have heard it whispered, the dogskin jackets are now in such favor with sportsmen, though the dealers in this article hesitate in this skeptical age to set forth this virtue in their advertisements. And, furthermore, if the fact became well known it might lead to the suppression of the sale of them.

Now this influence, whatever it is, is not only exercised by such bodies on such objects, but also by inert and inanimate articles of food on the animal when dead, and even on parts of it. For instance, I have seen a raccoon skin cap irresistably drawn to an ear of boiled green corn, and a dish of frog's legs, although there was so ponderous a body as a man's head inside the cap. And when the corn and the frog's legs had drawn the man's mouth over them and had then fallen into his stomach, the cap was so strongly pulled downward by the force of their attraction, that it required all the strength of his arms to push it off his head. There is also an antagonistic fluid, principle or whatever it may be called, contained in some bodies. I have seen cat skins hanging against a wall swell up their tails and strive to climb higher when a dog came into the room, and any one may see by waving the wing of a hawk or a large owl over grouse, duck or woodcock feathers, or any such, how they will flutter away and disperse in all directions. Sometimes, when I have myself pointed a gun, no matter with how little care, the lead has gone so directly to the mark that I have thought some such subtle influence draws shot and ball to game, but when I have seen some others shoot, I have thought differently, and that possibly there was a repellant power existing in and perhaps exercised at will by the object, which made the missiles diverge or broke their force so that they were made harmless. May it not be that the lead becomes charged with a positive or negative force by being in contact with the person of the shooter, wherein the one or the other is engendered?

But such matters I would better leave to be settled by minds more schooled in philosophy than mine, for I am in no wise fitted to discourse concerning them, being only a plain old hunter with little knowledge got of books, and as all may see, of but few words. With my hunting mates I could never more than half hold my own in story telling and argument, with anglers not even this much, though they are ever modest and truthful men who exaggerate nothing, to their own belittling or their craft's. Just and honest men they are too, for they cheat no fish of their own catching of their full weight, nor the count thereof of the highest number. I have never known an angler worthy of the name who would not honor a fish of his own taking with twice the weight another man would award it, and who, if he lost a fish, would not be so generous as to give the escaper credit for the wiles of a serpent, and the strength, if not the bulk, of a whale. I love, honor and admire the angler. I love him for his patience, never losing his temper whatever befalls, and for his gentleness, as shown, for instance, in his tender and compassionate treatment of live bait. I honor him that he never tells a lie to glorify another, nor owns that he has told one to glorify himself, and I admire him for his skill in invention, not only of rods, flies, hooks and so on, but in other matters pertaining to his pastime, and for the even balance of his brain, whereof he is himself so well assured that he scorns all brazen and steel contrivances for determining the weight of fishes, showing therein a triumph of mind over matter.

I would that I might count myself a true angler, but though I have caught many fish in my day, I never had a right to claim that name, for reasons which my readers may guess. But doubtless the craft has reason to be thankful that I am not of it, for if I had turned my attention to the beguiling of simple fishes, it is possible that there might be prayers for more fish and one the less angler.

Once in my life I thought I had achieved glory enough in the capture of one trout to make my name forever famous in the annals of angling. And I think now that if this fish had been caught by an approved and acknowledged member of the fraternity, and the story told by him, the feat would have been considered remarkable. But in the unembellished narration of facts which I must give, I fear the reader will find nothing unusual, nor hardly worth the reading.

In my wanderings in Adironda I discovered a kind of very large worms feeding upon the leaves of a species of wild mulberry which grows there, the fruit of which, resembling in shape that of the common wild mulberry, is as big as a saucer. This worm is as large as a man's wrist and a foot in length, and has been named by scientists *Vermis giganteus veritii*, whatever that outlandish title may mean. Noticing that they resembled silk worms, I conceived the idea of drawing gut from them, and so tying one end of a worm to a tree with a strong cord, I made fast another longer cord to the other end, and severed the skin all about his middle with my hunting knife. Then putting this long cord over my shoulder, I went forward at a steady pace with an even pull, the worm shrieking and groaning so piteously when his bowels first started asunder that I was near abandoning my experiment out of weak tenderheartedness. But the worm presently gave up the ghost with a great moan, and I held on my course for a half mile or so, when I came to the shores of a small lake, and the gut, so called, being drawn out to nearly the desired fineness and very even and well-looking withal, I fastened the end to a tree and let it dry. The pond or little lake which I had never before examined much, seemed to be alive with what I took to be very large trout, and here I thought was a very convenient and proper place for a trial of my new gut, where there were none but myself and the fishes, and herons and kingfishers to witness the failure of my experiment, if so it should turn out. So I cut a straight dry cedar about fifteen feet in length for a rod, and taking a fair-sized hook from my pocket I tied upon it a fly made then and there of some duck feathers drifted ashore, and a bit of red flannel from the lining of my coat, and when finished was well calculated to excite the curiosity and wonder of any fish that ever swam. My worm gut being now as dry as my own intestines, I having been some hours from camp, I cut off twenty feet of it and made an end of it fast to the rod, and fixing the hook to the other, began to cast. At the first cast there was a boiling of the water as if the infernal fires had set it seething, and directly I became aware that I was fast to a very goodly fish, and one that with my poor rod without a reel, I was in great danger of losing. Looking about for a beach where I might strand him and kill him with my knife, I saw an inlet of the pond a couple of yards wide at its mouth, and it occurred to me to lead him thither, and I succeeded in doing so. Having got him headed up it a rod or so, he could not turn about on account of his length being twice the width of the stream, I wound the gut upon the end of the rod by turning it in my hands, and shoving the point of it before me I waded to my hips into the stream behind him and guided him up the current before me, hoping to find it presently so narrow that he would be wedged between the banks. After some tedious labor, and being all the while in danger of having my shins broken by the blows of his caudal fin, his dorsal fin splitting the swift surface and his belly grinding and grating along the pebbles of the bottom, I succeeded in accomplishing this and had him jammed fast between the steep banks. Then I walked along his side till I came to his head, which I mauled with a great rock till the kick was all taken out of him. I was well pleased with the behavior of my new gut, which had borne such a strain, and I was somewhat proud of having killed such a fish, and was admiring him, and perhaps myself, when a splashing of the water above me attracted my attention. Then wading down with rod and creel appeared the Rev. Doctor Rodster, whom I had heard was fishing in the region. "Why, Major," he cried, "is this you? I was not aware that you were an angler." I assured him that it was no one else, and showed him with some exultation my catch. Coming up alongside of the fish, and standing about midway between the head and tail, he viewed it for a moment with an ill-concealed expression of contempt on his countenance, and said, "Surely, Major Verity, you do not think of killing this poor little fellow; but will return him to the lake!"

When I told him, with some shamefacedness, that the fish was already dead, he went away exceedingly wroth, muttering something about "trout hogs."

Since then I have fished only for my stomach's need, and never for sport. MAJOR JOSEPH VERITY, U.S.H.M.

ADIRONDA.

DOWN THE YUKON ON A RAFT.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

Eighth Paper.

OUR last article left us drifting down stream as fast as the current would pack us, and the gravel and sand bars would permit, while a big buck moose was drifting up the valley of a tributary as fast as his legs would pack him, and the underbrush and fallen timber would permit.

This was not far from a bold, high bluff of yellow sand and clay that the Indians use as a conspicuous landmark in their wanderings up and down the river, and to which they give the name of Hoot'-che-koo. The river from here on for quite a ways is very picturesque, and looks like the views on the Lower Juniata, Pennsylvania's pretty stream, until one steps ashore in the soft, marshy moss of the tundra land that exudes an ooze and mosquitoes, that makes him think that he has one foot in New Jersey and the other in the Dismal Swamp of Virginia. I believe one miner traveling through here had expressed an opinion that settlers might raise wheat in the bottom lands. I think I would agree with the comments of another on the opinion of the first that wheat could possibly be raised—to five dollars a bushel if there were enough miners to want it. Traveling on during the disagreeable, rainy afternoon, we sighted an Indian house of logs, about 8 in the evening, and with the usual hard pulling we soon found ourselves alongside the place. A rapid inspection showed it to be deserted, and from my Indian guides and workmen I ascertained that it was chiefly used in the winter by a sort of mixed population of Ayan and Tahkheesh Indians, both of which tribes are called the "Sticks," I believe.

We had passed through the land of the Tahkheesh from the time we left the Chilkoot country to about this point, for savage tribes seldom have any very definite boundary unless determined by high mountain chains or prominent waterways. From here down the river for two hundred miles the Ayans, or Iyans, held the river and its valley, and extended quite a way up the Pelly, the local Indian of which is, I believe, the Ayan River. The particular local name of this village (if one house can be called a village) is Kit'l-ah'-gon, which I believe means a house or village in a cañon, or between two cañons, or some way relating to its picturesque situation, and in this respect Kit'l-ah'-gon is not inappropriately named. The main basis of its title as a village is the large number of small brush houses that are scattered around near the tolerably well constructed log house, and which from their dried up and dilapidated looking character, we took at first for smoke houses in which they would probably dry their salmon and other fish when caught, until our Indians enlightened us. The log house was quite airy and ventilated for a winter residence in sub-Arctic America, and it seemed to be better adapted for a summer abode in Arizona or Florida, but it was a palace compared with the brush houses that clustered around it, and shows how degraded and lazy these Indians are, with plenty of timber for log houses, and a peat-like moss for chinking, that with a very little labor would have rendered them perfectly comfortable, they neglect to build them. Over these brush piles of strong poles are thrown a number of thick caribou or moose skins, and when the snow falls in the autumn it gives them an additional covering of four or five inches, and they live a sort of a life that is a cross between that of an Esquimau and a gypsy. The house itself was about fifteen by thirty feet in plan, and with the one on the bank of the short river connecting lakes Tahko with Marsh, makes up the sum total of all the permanent houses in the Tahkheesh country, along the Yukon River, for a distance of about five hundred miles. Inside the house, through a low door—although some persons of less pretentious proportions than the writer might have crept in between some of the logs—the only floor was that made by nature and beaten down by the constant tramping of feet, while around a portion of the sides was a shelf-like structure, which may have done duty at one time as a bunk place, but in its present broken up nature would have puzzled a civilized chicken to have found a sleeping place on it. It may have once extended clear around, but the last persons that slept there found it warmer as fuel than as a bedstead. Overhead the house was covered in with three or four clapboards and a couple of clouds—except in fine weather.

We did not try the experiment of sleeping in the house, but put up our tents at a good respectable distance therefrom and snoozed comfortably through the night, for the rain kept the mosquitoes down. There was an insignificant looking stream coming in alongside of the village, and curiously enough the valley it drained was a very conspicuous one, much more prominent than the Pelly valley some twenty miles further on, although the two streams themselves would be like comparing Niagara with a mountain brook. This was one of those canal-like streams, that I described in a previous article, as common in this country, just too wide to jump and deep enough to drown a flagstaff, and slower than mid-winter molasses. There may have been a larger stream coming in through the valley, and this have been only one of its delta mouths, for the grass was too high and thick, and the rain too recent to make further hydrographic explorations interesting. Photographs were gotten looking up and down the river, and also of the Indian house. From our Indians we learned that next day we should reach the site of old Fort Selkirk, and that the chimneys were still standing, and further, that its proper place was on the western bank of the Yukon proper, opposite the mouth of the Pelly, although several maps in our possession had ferried it across, and put it between them at the junction of the two streams. It looked so "kinder" natural to put it there, that we were a little bit inclined to think that the Indians, who had been there did not know, and that the map-makers who had not, really did; and with such thoughts in our mind, we were forced to acknowledge that if we had not traveled over the country itself, we probably would have made no better maps than those in our possession, and probably not as good, if we had interviewed the wrong Indians in another part of the country. But Selkirk was not where it ought to have been, but where the unlearned savages said it was, and next day as we drifted down through a great network of islands, that in a perplexing way kept us edging off to the right, we suddenly saw the bare chimneys loom up out of a thick poplar grove, clear across the river, and be

fore we could navigate across we were nearly half a mile below them, but in a much better place for a camp after all. It almost seemed as if we had landed in New York city, so welcome did it appear to be on land where explorers had preceded us, for now we knew the "coast was clear," clear to the coast, and it was a mere matter of drifting with the current to our destination and completing our work while *en route*.

The history of old Fort Selkirk has been slightly outlined in previous articles, so important a spot was it with regard to our expedition as a point of reference. Here we ceased to be explorers, and became only surveyors to old Fort Yukon, some 500 miles beyond, and from there the river had been very well surveyed to its mouth, another 1,000 miles in distance. In 1851 a party of Chilkats and Chilkoots that had crossed the Kotusk Mountains to trade with the Tahkheesh, exasperated by finding so few of the latter on the old trading grounds, and rightly conjecturing from the reports of these few that this falling off of their commerce was due to an opposition that had been started at the junction of the Pelly and Yukon some few years before, and was slowly making inroads upon their business, trading had at last reached the point where it was no longer remunerative to bring a hundred pounds of trading material on their backs over the snow and ice of the mountain passes for nearly as many miles. So these Indians made a sudden resolution characteristic of Indian action, and exchanging their goods for canoes instead of furs, and well armed, they made a descent on the unprotected fort, if it could be called such, surprised it early one morning in the summer just after the annual supply of goods had been brought in. Finding but three or four white men in attendance they were securely bound, the store was pillaged of all its contents and then burned to the ground. The white men were then released and allowed to return to Fort Pelly Banks, an older trading station on the head of the Pelly, and from which Fort Selkirk had been thrown out as an advance post. Much of the plunder was given to the local tribes or traded to them at a profit they had never dreamed of, and a thirst was planted in them for such easy methods of collecting necessaries from civilized traders, which finally culminated in the destruction of the fort at Pelly Banks, and thus the "coast" was completely cleared.

The adventures of these old Hudson Bay posts and their daring traders would be an intensely interesting volume could it ever be collected and written. Many a hunting and fishing adventure could be told that would absorb the attention of the readers of FOREST AND STREAM as they read of these adventurers shoving their merchandise through the great unknown Northwest territory to the Arctic Ocean itself. Every one is familiar with the Canadian voyageurs, or French half breeds that formed the great bulk of the Hudson Bay Company, under the direction of hardy Highlanders, who, in their turn, lorded it over the Indian workmen under them. Along the great broad streams like the Athabasca, the Peace River, the Mackenzie and many others their work was simple enough, and strongly resembled the good old boatmen's days on the Missouri and Mississippi, yet preserved in many a tale and story, but as the heads of these sub-Arctic rivers were reached in the hills and mountains and rapids and cascades commenced, they found obstacles to surmount that were not easy. Such was the road that led from Pelly Banks to Selkirk. Everything was carried in bundles of a hundred pounds, called a "pack."

I met an old Hudson Bay trader on the Lower Yukon, who told me a laughable incident connected with his first initiation into the duties of the company, some thirty or forty years before. Having determined to join it and, in the exuberance of youth, to work his way to the most northern posts where the adventure which he sought was most likely to be found, he presented himself at a station on the Red River, and being a strapping young fellow, he was at once enrolled. He knew a little about the company, having "knocked around" in its neighborhood from a boy, and had seen many a "pack" handled, and thought himself perfectly presentable for a situation when he could do the same, and not until that time did he solicit employment. Everything was arranged, and he had been booked as a "voyageur" at $35 a month, I think, and everything went on swimmingly for a week or two when the first portage was reached. This extended around a series of boiling rapids some five or six miles long, and his heart sank within him at the thought of carrying a number of the huge "packs" this long distance. A number of boats had gotten in ahead of the one to which he belonged, and as their loads were taken out he saw their crews of voyageurs without any delay prepare to carry across, for the army-like discipline of the company allowed no loitering. His surprise may be imagined when he saw one, two, three, and even a half a dozen of the men put two of the 100 pound packs on their backs; but no pen can portray his consternation as he saw them one after the other take up a good steady run over the hills and far away, and before he was really ready with his first "pack" be back for another load. He struggled with the new developments manfully, however, but before he had gotten half way across, amid the jeers and taunts of his fellow packers, he had to give it up, and depositing his 200 pounds against a stone, he walked back to the trader in charge and after a short preliminary conversation stating the case, said he was willing to pay $35 instead of receiving it, if he could only be counted as a passenger thereby. A proposal which was accepted, and the chief trader pocketed the money.

In the burning of old Selkirk in 1851, the Chilkats knew that they had the sympathy of the Russian traders at Sitka and other posts on the Pacific, who were rivals to the Hudson Bay Company, but to say, as has been done, that these traders instigated and concocted the plan is carrying statements further than the evidence will warrant. Much has been said regarding the efficient and admirable manner in which the Hudson Bay Company has, in the past, conducted its relations with the Indian tribes, with which it has from time to time found itself in contact, these criticisms, ninety-nine cases out of a hundred, arising from a discussion of our own Indian question, and with deductions, as a general result, badly against us as a nation. The pioneer fur traders of a wild country have but one object as regards the Indians in their front and civilization at their back, and that is the closest and most friendly and intimate terms with the former and the most deadly hatred to the latter. As civilization crowds forward on his ground, the trapper takes his place as well as that of the Indian, and the two—the trapper and trader—are often spoken of as synonymous, although as far apart in their feeling toward the Indians as the two poles. The true trader is never a trapper, the Indian doing that business for him. With the latter he therefore has no object but that of friendship, or to be more accurate, apparent or superficial friendship, for no man on the frontier has more contempt for the very Indians that have made him rich than the fur trader, as evinced by their conduct and conversation after abandoning or retiring from the business. In case of possible hostilities with a tribe, or even an individual member of it that stands well among his savage brethren, he is the most cringing creature on face of earth, and when actual hostilities are inevitable, however brave he may be personally—and all the elements of bravery are needed in their peculiar craft—their actions must be governed by the monetary object in view, and the most cowardly surrender of the field often takes place. The trader knows that, if no blood is shed, sudden and transitory outbursts of Indian wrath soon pass away, and he can then return to his money getting. Should an Indian be killed, however, it may take decades to settle the matter with the tribe, while as a family feud it never would be settled by less than an equivalent life, and this is too much to spare, when but two or three often make up the sum total of post or station. Much as the trader hates the Indians, he hates civilization much more. One simply interferes with them now and then, while the other completely obliterates his employment, and it is with zealous eye he keeps all his disagreements with the former from the ears of the latter. It is no wonder then that the relations between the trader and his Indians are so little known that they are held up as a model to those who know still less, when, if the truth were known, these relations are in many respects abominable. Such has been the history of the Hudson Bay Company to a greater or less extent, and such has been the history of all fur-trading companies, and such were the musings brought forth by a revery in the shadows of the blackened chimneys of old Fort Selkirk, and over which the poplars waved their tops, so long had they battled with the elements.

Not far from here was another sign of death, in the shape of an Indian grave peculiar to this part of the country. Knowing a little something of the mode of burial of white men from ancient intercourse with them, they had made some very rude and rough attempts at imitating it in the shape of an inclosure not unlike our own, but made of rough-hewn boards. It was impossible to completely rid themselves of savage ideas, and from poles near by, so close that any one would know they were a superstitious part of the grave, flaunted red and white rags, while on the top of one was an image of a bear or a fish or a goose, I have forgotten which. Approaching to see if there was anything else on the rough board fence or elsewhere expressive of savage rites and ritual, a combination of hieroglyphics met my eye on one of the upright planks that looked as if it might have been done by a lead pencil, or in the absence of such articles of civilization in this vast wilderness, the untutored savage might have used a piece of graphite from some mineral source near by. A sketch of the inscription is given as near as I could draw it. Running from left to right like English writing it ran:

"NOT DED YeT BY A DAM SITE OLE ARESONY. JuLY 83."

And in fact had some resemblance to ancient English in a few words. Looking across the river at the islands there could be seen more than enough driftwood on their upper ends to make a good dam, but it was a very poor place for a dam site, as far as I had been taught in hydraulic engineering, if this was what the inscription referred to; and in general the whole effect was so intangible that one could not pin it down to that exactness of meaning that is demanded by modern science, and it was passed by. Formerly, so my Indians informed me, these same natives buried in scaffolds in the trees, not unlike the Indians on the great Western plains, and inscriptions were rare.

It is at about this point on the river that birch-bark canoes commence, and were first seen among the Ayans, a band already alluded to, and whose principal village was some twelve miles below, and it might also be said that where they are first encountered. They are decidedly the neatest, the trimmest, the smallest, and the best in workmanship and construction, and from here down the stream all of these qualities slowly become less noticeable, although it would hardly be proper to say at any time that the majority of canoes among any tribe on the river are not of a substantial build. The sewing is done with long withes so fine and pliable that the work looks as if it had been done with sinew, and even this characteristic degenerates as we descend the river. These withes are made from the roots, I think, of some trailing plant, and are minutely sub-divided before being used. These pretty canoes, as light and graceful as a bird on the water, were a wondrous change from the heavy, cumbersome, water-logged canoes of wood that we had been used to up to this point. As with his cottonwood brother, so is the birch-bark canoe patched with spruce gum, but it does not seem to be done on such a wholesale scale, and it is worked down and polished off until it looks like a patching of glass when completed.

The river down which we had drifted so far on the raft, and which I have constantly mentioned as the Yukon, was called by the old Hudson Bay traders the Lewis River, they knowing it in and around old Fort Selkirk, and it was supposed to join the Pelly and form the Yukon. In fact, in the very oldest accounts the Lewis River ran into the Pelly, a smaller stream, and it was called Pelly to its junction with the Porcupine, at old Fort Yukon, and from there was called the Yukon. The comparative sizes and volumes of water of the Lewis being unknown, I had decided to make the most thorough investigations, should they be necessary, to determine which was really the Yukon proper. In sight of the two rivers, at their junction, it was quite evident that the Lewis was the larger; but Mr. Homan, being sent across to make measurements of the other, and ascending the Pelly a short distance, even gave up that part, so evident was it that this Pelly was the smaller of the two. Of course I was glad enough to get such news, for the Pelly was an unsurveyed stream, and had it been the greater I would have had to content myself with exploring one of its tributaries and only a part of its course, whereas I now had, and would have, all the data for a survey of the whole Yukon from source to mouth.

Trout lines put out over night caught a sort of nasty looking eel pout, each hook baited with meat having one, that were so uninviting in appearance that one would have to border on starvation before taking them by any of the usual methods of cooking. Grayling were still to be had in limited numbers, and one big salmon trout gave the Doctor a scientific struggle lasting nearly half an hour before he could be induced to "come in out of the wet." Fresh moose tracks were to be seen but no one seemed inclined toward moose meat with mosquito accompaniment. Astronomical observations were taken to determine the point and everything was prepared for another movement forward on the morrow.

[TO BE CONTINUED.]

Natural History.

PRESERVATION OF SONG BIRDS.

Editor Forest and Stream:

Having read with considerable interest the article over the signature of "X.," I must say that I indorse the whole. Let us have a law to prevent the shooting, by men as well as boys, of the insect-eating and song birds of our land. That ornithology consists in filling the skins of slain birds is the merest nonsense. Let, as your correspondent remarks, men as well as boys, go into the fields and woods without gun, but with note book and pencil, study the habits of the birds, and they would gain more information in a week's time well spent than from a whole life spent in stuffing skins. How many persons who fill the skins of birds with cotton, tow and straw, could draw the forms of the same? There was one English artist who excelled in drawing the human form; that could, and did, draw the human skeleton in one colored ink and clothed it with muscles in another colored ink. Such perfection is rarely attained. Still, young men, and older ones also, might do a little to rob their killing propensities of its sting. The dialogue of "X." is a complete answer to all quibbles. Let boys and men learn. X. Z.

UTICA, N. Y.

Editor Forest and Stream:

"A bird never flutters unless it is hit." As I wish to flutter, I will begin by considering myself hit, although as I am not a taxidermist nor milliner's collector, and am somewhat past the age of sweet sixteen, where the average "boy with a gun" is supposed to do his worst, it is evident that it is only by a stray pellet and not by the center of the charge, which "X" in your issue of March 20, and which others in previous ones, have fired promiscuously among all who desire to make even a limited collection of skins, or eggs, or both. Why is it that all unite against youth? Is youth a crime to be laid at the door of its possessor? Were Wilson, Audubon, Baird, Coues and others, never young? Did they not begin their studies as young inexperienced boys? There must be a beginning. There must have been a first awakening of that love of nature, of that irresistible desire to know more of her feathered subjects, which has caused our most distinguished naturalists to turn away from the masses who strive only for the "almighty dollar," and to take to themselves want, discomforts, bodily peril, and sneers and the rebuffs of their more practical money-making fellow-men.

When we remember the earnest researches of Wilson and Audubon, the many days of patient study they devoted to live birds, let us also remember that one of them at least was a nest-robbing boy, without any show of scientific propensities, for we read of his "strings" of birds' eggs. To read some of the articles which appear from time to time, one would suppose that every one who shot a bird or took a set of eggs did it either from a wanton desire to destroy, or for money. It is this sweeping condemnation which I resent as unjust to some of our young collectors, who, I think, are actuated by as sincere motives as ever moved Wilson, Audubon, or any of their successors. I believe that among the rising generation may be found some of our most observing ornithologists. Many have already been mentioned in various publications as having made important discoveries. The subject of the migrations of birds, which is now receiving more than ever before, the attentions of naturalists, both in Europe and America, depends largely on the observations of collectors in different parts of the country. The FOREST AND STREAM has a natural history department of constantly increasing interest. How many of the notes contained therein are contributed by the younger members of the fraternity? There are those now, who are no doubt working faithfully, though unknown to fame, who will yet win their laurels, but who are young and so inexperienced that they deserve the censure administered about a year ago by "Homo," when he complained that they were shooting birds whose sex they were unable to decide.

I do not believe the bond proposed in the Massachusetts law will have the desired effect any more than the plan suggested by some of your correspondents of taxing the gun to prevent market hunting. The professional market hunter would pay the tax, the sportsman, who could use his gun at most but a few times each year, would not pay it. Result—market hunter gets all the more birds, the limited sportsman gets none. The professional "hat bird" collector will find some means of evading the consequences and will shoot all the more during any opportunity that presents itself, while the student, who desires specimens for the specimens themselves, will be the sufferer.

And now, speaking of hat birds, do the ladies themselves really care for the birds? Are they sincere? Let any one walking our streets notice the ladies' hats and he will have strong reasons for doubting the sincerity of the fair sex.

I have no doubt that if it could be positively known how many birds were killed for private collections and study, and how many were killed for ornament, that it would appear that the latter far exceeded the former. I know I am taking sides against public opinion, but I don't blame public opinion; I blame those unscrupulous persons who, to put a penny in their pockets, will destroy anything; who while pretending to be interested in the study of the birds are interested only in the dollars and cents their stuffed skins will bring to them, and I sincerely believe that it is this wholesale shooting for the purpose of supplying milliners and other similar purposes that has caused a decrease in the number of our song birds. It is the old "trout hog" in a new form, the pot-hunter bringing disgrace on the sportsman.

Suppress, if possible, the barter in skins, in hat birds, and other similar "gewgaws," but don't shut out the earnest, diligent student, who, if he occasionally shoots a bird or takes a set of eggs, does so with a higher purpose than that for the love of money. The birds have no better friends than are those who study their habits, and I doubt if any class would more deeply deplore the loss of the birds than the very class so often unjustly assailed, young and inexperienced though they may be. SIALIA.

[We are sure that a large majority of the writers on this subject are animated by a sincere desire to protect our insectivorous birds from wanton slaughter. The honest, faithful student should undoubtedly be permitted to collect bird skins, but how is it to be determined that any supposed student is honest? How do we know that he is not collecting merely for the hat men? Since our correspondents are working for the same end, it is not worth their while to waste their ammunition on each other.]

THE DEADLY MINK.

I NOTE with regret, the loss of Mr. Fred Mather, of Cold Spring Harbor, N. Y., of his flock of beautiful wood ducks. Too bad!

A few years ago, I had some fifty of these birds, collected and caged for stocking other localities. One night about midnight, I heard a rushing and roaring of the birds in their room; within three minutes of the first alarm I was at the pen, with light, and a heavy two-foot knife. I let down the door, and put light, knife, head and shoulders inside. Around to me came the birds; behind, and driving them was a large mink, which came near enough, and I split his head with the knife, and left him heels up, kicking. I could see that the floor was about covered with ducks, heels up, and kicking too. In the morning we found over thirty birds killed by the "varmint," or so badly wounded that we thought best to kill them, as they would die of their wounds. The fiend had cut the throats of most of them, and some were bitten in the head. None seemed to be dead when I first got out, but he might have killed some before they gave the alarm, but I believe not. The mink did not notice me or the light, except when I struck him, then he stuck up his bloody teeth at me, for a fight, apparently.

I have handled these birds since, sometimes, for breeding and domestication, but like Mr. Mather, I "covered the well since the calf was drowned," and at night confined the birds in a room that is mink, weasel and rat tight, the only safe way in this wild-woods country. At Cold Spring Harbor, I expected a better civilization. LOUIS A. LELAND.

MICHIGAN, March 26.

STEARNS'S NATURAL HISTORY OF LABRADOR.

IN the fifth volume of the Proceedings of the United States National Museum, there is a paper of twenty-seven pages, entitled "Notes on the Natural History of Labrador," by W. A. Stearns.

Mr. Stearns made a summer excursion to Labrador in 1875, and spent nearly a year there in 1880-1881. He also visited the coast again during the summer of 1882. His examinations were confined to the vicinity of the seaboard. The results of these investigations are contained in this paper; and are presented in the form of briefly annotated lists of mammals, birds, "reptiles" and batrachians, fishes, and plants. In his introductory remarks, Mr. Stearns states that the spring catch of the Newfoundland and other sealing vessels is from thirteen to sixteen thousand young seals. As a matter of fact, a single vessel sometimes procures double this number. The annual catch of the Newfoundland sealing fleet rarely falls below two hundred thousand, and commonly ranges between three and four hundred thousand. Twelve times during the present century it has exceeded five hundred thousand; four times it passed six hundred thousand; and once it reached the extraordinary number of seven hundred and forty-six thousand!

In the list of mammals, the silver and black foxes are accorded varietal distinction.

The ringed seal or floe rat (*Phoca fœtida*) is given as "not uncommon in harbors in spring and fall. Distinguished from last species [*P. vitulina*] only on close examination." In view of the fact that this seal does not rank among the migratory species, is it not possible that a still closer examination would demonstrate its identity with *P. vitulina?* If Mr. Stearns brought back so much as a single skull of the animal in question, and will submit it to either Mr. Allen or myself for examination, the matter can at once be settled.

The absence of the large gray seal (*Halichœrus grypus*) from the list is surprising. I know from personal observation that it is common at some of the localities mentioned.

Our author says: "Regarding the deer of Labrador some confusion exists. Two species, about equally common, are found throughout the peninsula in small, or less frequently in large (300 or 400) herds. They are probably the following: *Tarandus rangifer*, Brookes, var. *Caribou*, woodland caribou; and *Tarandus rangifer*, Brookes, var. *Grœlandicus*, barren ground caribou; *Alces malchis* (Linne) gray, the moose, and *Cervus canadensis*, Erxleben, the American elk, have both been reported as found on the southwest portion of Labrador, about north from Anticosti, but they are doubtless very rare and occasional."

I regret that I cannot agree with Mr. Stearns in considering it probable that both the woodland and barren ground caribou are found in Labrador; and his remarks concerning the moose and elk are most unfortunate. I have seen no evidence to indicate that the elk ever inhabited the area under consideration; and the moose is known to be restricted in its eastern range (along the north shore of the St. Lawrence) by the Saguenay.

We are informed that the white whale (*"Delphinapterus" catodon*) is "common in the St. Lawrence River, at least as far as Anticosti." It is equally common at certain seasons off the entire Labrador coast, and great numbers of them annually pass through the Strait of Belle Isle.

"Gray squirrels are said to occur here also, but I did not see any," writes our author. The failure to inspect the gray squirrel on the far-off rocky coast, should not be attributed to negligence or bad eyesight; for Labrador is not only far north of its known range, but the physiographical conditions that obtain there are such as would preclude its occupancy by this animal, even if the area were not latitudinally excluded from its habitat.

The concluding mammal is the little brown bat (*Vespertilio subulatus*), and the record would be more acceptable were it accompanied by the name of the person who identified the specimen.

The list of birds contains one hundred and eleven species, and some startling statements.

The record of the wood thrush (*Hylocichla mustelina*) has already been queried by Mr. Ridgway, and I will only add that I have found both the hermit and the olive-backed thrush breeding along the north shore of the Gulf of St. Lawrence.

The pine grosbeak (*Pinicola enucleator*) is given as "common in fall and winter." It unquestionably breeds throughout Labrador, and I have myself found it breeding near Point de Monts.

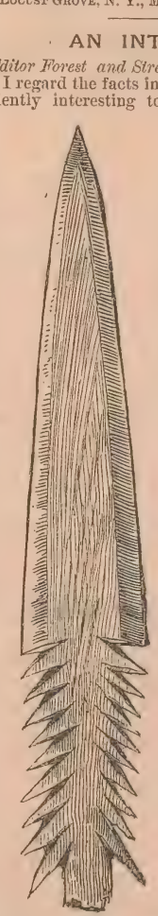
The common *Junco* is said to be "not rare in spring and fall." Of course it breeds. The rock ptarmigan (*Lagopus rupestris*) is stated to be "not rare. Generally common in winter."

When the author, in referring to the discovery of the nest of the king eider (*Somateria spectabilis*) on an island off Mingan, says that he believes this to be "the first record of this rare nest found on the Atlantic," he must employ the term Atlantic in a somewhat restricted sense, for the species is known to breed abundantly in Hudson's Bay and Davis Strait, and probably along Northern Labrador as well.

Mr. Stearns makes the extraordinary announcement that the Pacific eider (*Somateria v-nigra*) is "abundant in large flocks in spring." If this statement can be authenticated, it is certainly a most interesting and valuable contribution to ornithological science.

The Arctic tern (*Sterna macrura*) is given as "an abundant spring and fall migrant in the Gulf." Large numbers breed at certain places along the coast.

Under the head of "Reptiles and Batrachians," our author tells us that he heard frogs "in the marshes about the mouth of Pinway River," and enumerates *Rana septentrionalis* and *Plethodon glutonosa* as having been found by Dr. Packard. Without mentioning a single reptile he goes on to say, "The reptilian fauna will probably be enlarged, but not to any great extent," and passes directly to the consideration of fishes.



Turning to the list of plants, we find 157 species enumerated, twenty-eight of which are glumaceous and cryptogamous. Hence, omitting the grasses and sedges, we have but 129 flowering plants, more than fifty of which are included on the authority of the Rev. S. R. Butler, whose list was published in the *Canadian Naturalist*, in 1870. This leaves less than eighty species as the result of our author's botanical investigations during one entire year and two summers. That this is not wholly attributable to the meagre flora of Labrador is evident from the fact that I have myself found, in an hour's time, nearly this number of species growing in a single locality not remote from the seat of our author's labors. C. HART MERRIAM, M.D.

LOCUST GROVE, N. Y., March 12, 1884.

AN INTERESTING RELIC.

Editor Forest and Stream:

I regard the facts in the case I am about to report as sufficiently interesting to be worthy of publication in your columns, believing they will be received with appreciation by the general subscribers to your issue, and afford material for speculation to those who may regard the matter from an ethnological or ornithological point of view.

About a fortnight since, while on a gunning expedition to one of the small islands in Chesapeake Bay, Mr. James Frick, of this city, captured a specimen of the wild swan. Though I did not have an opportunity of examining the fresh specimen, when brought down, I am informed that it was of average size. There were no observations made to determine the sex or probable age. The curious feature of the case was disclosed, however, after the bird was prepared for the table, and subjected to the carving knife, when an iron arrow or spear head was discovered beneath the pectoral muscles, and lying against the breastbone. The sharp end was buried in the bone to the depth of a quarter of an inch, and when extracted showed a slight bend near the tip. The whole instrument was covered by a membranous sheath, no sign remaining in the region of the original wound by which the probable time of its infliction could be approximated.

The accompanying sketch I have made in exact accordance with the shape and dimensions of the original, trusting that it may be given in accompaniment with the relative statements. The iron is $\frac{1}{16}$ of an inch in thickness.

Since the range of territory frequented by the swan during the breeding and migratory seasons is very extensive, it becomes an interesting problem to assign the origin of this bit of iron, unless these facts come under the observation of one familiar with the implements characteristic of Indian, Esquimaux or other savages. P. BRYSON WOOD, M.D.

45 FRANKLIN STREET, Baltimore, Md.

BIRD NOTES.

WOODCOCK are here, so are robins, bluebirds, song sparrows and fox sparrows, red-winged blackbirds and golden-winged woodpeckers. I have also seen lesser redpoll linnets, and quite a number of yellow-rumped warblers (*D. coronata*). A good deal of ice in our ponds, but the snow is fast disappearing. X. Y. Z.

SALEM, Mass., March 22, 1884.

Wild ducks were shot here on the 17th inst.; two out of a flock of six. They were black ducks. DELL WELLS.

MANTORVILLE, Minn., March 22.

Saw first wild geese Monday, March 17, bluebirds, robins, blackbirds, March 19, black duck, mallard, whistlers and bluebills March 23; there is a good flight of ducks here now. W. M. G.

WOODVILLE, N. Y., March 23.

Geese and ducks put in an appearance on the 20th; 21st robins and blackbirds, and the familiar "scaipe" of the snipe was heard. This morning blue and other birds, and the air is full of song. Crows remained with us all winter.

ROSENDALE, Wis., March 22. S. B. D.

Though snow is still on the ground, some of our songsters have arrived, viz., robins, blackbirds, and what is known here as the Canadian nightingale. The quail that were imported and turned loose at Lachine about three years ago have all gone. TUQUE BLEUE.

MONTREAL, Canada, March 28.

Up to a week ago the season was backward, but since then it has been much more forward, and woodcock have been frequently seen; but last night very suddenly the weather changed, and people upon getting out of bed this morning found a raging snow storm with drifts two to four feet deep, all done in a night. Curious to see if I could find any woodcock, I took a walk this afternoon, and just as I was leaving the last piece of cover up went a woodcock, I think a male bird. A number of flocks of black ducks (*A. obscura*) were seen yesterday. March is going out like a lion this year. X. Y. Z.

SALEM, Mass.

Here at St. Cloud, Minn., I have seen the following birds: Jan. 9, raven; Feb. 1, crows; March 14, one flock of seventeen ducks flying south; March 17, one duck flying west; March 23, one flock of geese, lit in farmer's field; March 24, one flock of geese (wanted to light in Lake George at St. Cloud) and one meadow lark; March 25, killdeer plover, robins and blackbirds. That first flock of wild geese were reported to me by the farmer himself; he shot at them but missed. We are having very nice weather here now.

ST. CLOUD, Minn., March 26. LARK.

Robins appeared here to-day. Crows were first heard on March 17. K.

CENTRAL LAKE, Mich., March 25.

A rapid tour through Prospect Park this afternoon gave promise of the early arrival of the birds. Robins were quite plentiful, and I saw a yellow-shafted flicker. Rather early for him, is it not? Song sparrows sing cheerfully their quaint little song, and early in the morning the gray squirrel scampers about in play. JOHN BARRETT.

BROOKLYN, N. Y., March 22.

A PROPOSED ZOOLOGICAL GARDEN.

THE following letter has been sent to several Congressmen at Washington, and sufficiently explains itself:

Hon. W. B. Allison, 1,124 Vermont Avenue, Washington, D.C.:

DEAR SIR—Permit me to offer you the following suggestion respecting an amendment to the bill now before Congress relative to the National Park. During the past summer while I was viewing the National Park scenery, I conceived the idea of how valuable this Park would be to scientists, and consequently the world at large, provided that a part of it was set apart for a grand zoological garden. And that, since there seems to be some guarantee that the birds and animals—the latter such as are without claws—are to be preserved, at least so far as it is possible without strict confinement of these birds and animals, I think that for the present only such a garden should be established as would keep within its bounds the following described animals, mainly: The grizzly bear (*Ursus horribilis*), black bear (*U. americanus*), cinnamon bear (*U. A. var. cinnamoneus*). And of the deer family the following: Moose (*Cervus alces*), wapiti or American elk (*C. canadensis*), woodland caribou or reindeer (*C. tarandus*), mule deer, (*C. macrotis*), black-tailed deer (*C. columbianus*), common or Virginia deer (*C. virginianus*), barren ground caribou (*C. tarandus*). All of these and many other animals could be confined in a park or garden within the boundaries of the National Park, and by placing some one—an honest, competent observer—in charge, great benefit would be derived from the notes he would make, and which could then be published in like manner as the reports of the Smithsonian Institute.

At present but little is known respecting the hibernating of various animals, and particularly of the several species of bears. In the zoological gardens in this country and Europe these animals are so closely confined that but little opportunity is given the animal to present his natural inclinations, or that which might be considered his instinctive qualifications. Again, I can find no record that a bear has ever given birth to a cub while in confinement. Lions are not so disposed and more readily adapt themselves to the conditions of life into which they are placed, and often give birth to young while in confinement. A very interesting study is that of torpidity of animals, and one which in the near future will be of great service in working out many vexatious problems connected with the study of Nature. The location of the National Park is of very great value for this particular study; not that animals (and perhaps birds) do not hibernate in warmer climates as well as in that latitude and altitude, but that the periods of hibernation would be much longer and thereby give greater length of time for study; and further, that for study during the summer (or breeding months) there could be no better place found. It is well known that just such surroundings as are found in the Park—the caves, dreary and lonely places amid rocks and underbrush, plenty of clear, cold mountain water, and with the ever cool atmosphere of the high altitude there found—is Nature's breeding place for the largest of the animals we call "game." And while this is the fact respecting the advantages there found for the preservation of the family of bears, it is equally as serviceable for the propagation of the various deer of America. With the exception of that very valuable report upon the study of "The Antelope and Deer of America," by Judge Caton, of Illinois, we have but little knowledge respecting the habits of the antelope or deer of America; and this work is none else than Judge Caton's report of his study of the animals in question while in his private park in Illinois. Outside of this monograph we have absolutely nothing describing accurately these animals, and were it not for the energy and studious nature of Judge Caton, this interesting family of animals would have been but very little known.

But a few years longer can we expect, with the grand waves of immigration now moving from East to West and West to East, that bears, deer and many other interesting animals can be found in the wild state; and shall we let them meet the ill-fated hand of destruction, and to be known then in history only as the "extinct animals?" I earnestly hope some action can be taken that will preserve at least a few of these noble representatives of the fauna of this country, and that, too, in connection with our park, which, like our *Ursus horribilis*, is without equal. All the animals above named can be raised in the National Park, and I might add the "mountain buffalo" is found on Specimen Mountain, and it is claimed cannot be found in any other part of the world. Other animals I might mention which that climate would be suitable for raising in, and would alike prove of great service to the scientific world, are antelope (*Antilocapra americana*), mountain sheep (*Ovis montana*), mountain goat (*Aplocerus montanus*), buffalo (*Bos americanus*). The last I think would prove of very great value by crossing with our native cattle for the purpose of producing a hardier breed of cattle.

Merely as a suggestion I submit the above, and if consistent, desire that an amendment be added to the bill now before Congress, embracing the substance of the above suggestion, or as may be improved upon by a more worthy hand.

I am, very truly, D. H. TALBOT.

SIOUX CITY, Iowa, March 6, 1884.

[The establishment of such a garden we believe to be perfectly feasible, and there can be no doubt that in proper hands it would be of great benefit to science. Undertaken at first for the purpose of preserving our native mammals, it might afterward come to have a much wider scope].

FLEW AGAINST THE WINDOW.—Yesterday, April 2, two yellow-bellied woodpeckers (*Sphyrapicus varius*), still warm, were brought into this office. A few moments before, the birds, one pursuing the other, had flown against the plate-glass windows of the *Times* office and been killed. It was rather an odd place for this to happen, in the heart of the city. They must have been resting in the City Hall Park, and, chasing each other either in sport or rage, have so met their death.

GOV. CLINTON ON THE MUSKRAT AS A DESTROYER OF FISH.—Since writing the article published in your last issue upon the muskrat as a fish eater, I have discovered important additional testimony. In the year 1820 there appeared in a New York newspaper (*The Statesman*) a series of articles of no ordinary interest. They were entitled "Letters on the Natural History and Internal Resources of the State of New York, by Hibernicus." They attracted so much attention, and the demand for them was so great, that they were reprinted in book form in 1822. Their real author was Gov. DeWitt Clinton, a man of letters, eminent as a statesman, distinguished as a scientist, and justly celebrated as a philosopher. In the ninth letter he speaks of the muskrat as the most formidable foe of the canal, stating that it perforates the banks and thus lets off the water. Respecting this animal as a fish eater, he says: "In winter, when the water is frozen, muskrats go under the ice and prey on the fish. They are very destructive to trout, which is already in the canal." —C. HART MERRIAM, M.D. (Locust Grove, N. Y., March 29, 1884).

ALBINO ROBIN.—A robin, with white wings and tail, was observed in a flock of robins here on Wednesday, March 19. I regret that we were unable to secure it, although we did succeed in getting one long shot at it.—H. W. C. (Rye, N. Y.).

Game Bag and Gun.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

I have read with keen interest the discussion in your columns on the "Choice of Hunting Rifles." Having been absent in Canada since last November, whither FOREST AND STREAM does not follow me, being too readily appreciated to reach me in a transient wrapper, I have read the whole series almost at a single sitting. I have found a great deal to instruct, some things to amuse, and one thing which astounds me; and this last is the statement that twenty-six repeating rifles were every one rendered perfectly useless by a four days' march. The first repeating rifle I ever owned was a Henry, which had seen four years' service and something like eighty engagements in the 1st Maine Calvary, and was in perfect working when I got it, although I was obliged to get a new magazine spring shortly afterward, the old one being worn out by its friction against some slight dents in the side of the tube. Repeating rifles hang on the saddles of vaqueros for weeks and months, and are always ready for use, unless filled with sand, which will disable any breechloading gun.

Of all the articles written, the first two of Mr. Van Dyke's came the nearest to my views on this subject; but I utterly dissent from his deductions contained in the third. I firmly believe that a .40-caliber bullet propelled by the same amount of powder will strike with greater force than a .45, or any larger caliber. We are taught that the striking force of a projectile is the square of its velocity multiplied by its weight, and the resistance of the atmosphere as the square of its diameter, without regard to length, unless there may be a slight increase of friction in very long bodies, but probably not to be estimated in bullets. If these premises be granted, then it follows that the proper mode to get the greatest amount of force from a given weight of powder and lead is to put the latter in the form of a long projectile of small, rather than a short one of large, diameter. And now, as I believe in one's having the courage to state one's convictions, however startling, I am going to say that I do not believe in the "shock" theory; and by that I mean that no ordinary rifle ball will "paralyze" a deer, if not placed in a vital spot, or to make my meaning clearer, I do not believe that a deer will stop any quicker or die any sooner with a .60-caliber bullet through it than it will with a .40-caliber, provided both go exactly in the same place; and when I speak of parts "not vital" I do not mean the hips, as that is one of the deadliest of places to strike a deer, moose, or caribou when standing broadside to.

The first wounded deer I ever followed was an old doe in October, shot through and through by a young fellow armed with an old U. S. army musket, called in those days a "hoop gun," carrying a ball of about 1½ ounces. She bled freely from both sides, seemingly but little back of the shoulders, but after tracking her a mile the blood almost ceased to flow, and we finally lost her after spending half a day scouring the woods in every direction. My experience and belief in the superior killing power of the small-bore rifle over that of the large, owing to the greater velocity at which the former can be propelled, was acquired thirty years ago by mere accident, and as practice is always better than theory, I will give the facts.

At that time I owned a beautiful "double-shooter" muzzleloading rifle, made to order for me by H. L. Leonard, the well-known maker of fishing rods. Probably many of the older readers of FOREST AND STREAM will remember those rifles. They were invented in Pennsylvania by a brother of Leonard's. Two charges were loaded in a single barrel, the bullet of the back charge serving as a breech pin for the forward one. A second tube and cylinder was inserted at this point, connecting with the hammers by a slide, which was thrown up by loosening a catch when shooting the back charge. All the advantages of a single barrel were retained by these rifles, but great care was necessary in loading the back charge to prevent a double explosion, often resulting in blown out cylinders and a recoil that would knock down an ox.

At the beginning of the hunting season of 1854, while hastily loading this rifle, with a big buck standing in full view, the ferrule came off the end of my starter, and stuck firmly around the end of the pointed bullet. Instead of going home and removing the obstruction by taking out the breech-pin, I did what I fancy most hunters would do under the circumstances—rammed the whole thing down and fired. The bullet was forced through the ferrule about midway the length of the barrel, bulging it to such an extent as to be easily seen on the outside, and the bore, on looking through it, looked exactly as if a piece three inches long had fallen out all around it. I couldn't hit a flour barrel half the time at 100 yards. I was obliged to carry the gun to Bangor at once to have a new barrel fitted. The only one I could get which fitted the stock was a beautiful cast steel Remington barrel, carrying 86 bullets to the pound (avoirdupois) by actual weight. This, I take it, is about .38-caliber. On loading this new barrel I found that the same charge of powder that I used in the former barrel not only filled the small bore up so far as to bring the bullet opposite the forward cylinder, thus rendering double-shooting impossible, but also blew unburned powder out on the snow.

To remedy this defect, I had a hole the size of the bore drilled back, an inch and a quarter, in the breech pin. This brought the fire nearly into the middle of the powder, and the result was so surprising and unlooked for, that it completely revolutionized all my ideas on the subject of rifle bores. On testing it I found that more powder would burn than I cared to stand up against, although the rifle weighed ten pounds. I sighted it to a point-blank at 50 yards, with a pointed bullet of extra length (1¼-inch) using about 3 drams best F dead shot powder. At 52 rods, holding the same as at 50 yards, the drop was just nine inches. I used this gun for nine years, and its killing power exceed that of any gun I ever saw. I fired at sixteen moose with it during that time, every one of which I killed; using the second shot on only three. Can any bore show a better record? Many a time I have put my fist through the hole made in a deer's "lights" by this bullet. Twice I killed two deer at one shot with it, the bullet passing through both deer in each instance, and it would crash straight through the shoulders of the largest bull moose, and out on the further side. I parted with it on going into the service, and have never yet seen its equal. At present I am using a .40-60-260 repeater, and its performance is very satisfactory. I killed ten deer with it last season at thirteen shots, one of which was a miss; and five this season at six shots, the sixth being an unnecessary one at an old buck, already pierced within two inches of his heart by the first bullet. My ideal repeater is .40-caliber, 80 grains powder, 240 grains lead.

In my opinion, the greatest desideratum next to accuracy is a flat trajectory, and in the above rifle you obtain it, with sufficient force for any game short of grizzlies, and deadly enough for them if a man has the nerve to stand their charge coolly, and none others ought to hunt grizzlies. I have no belief that a rifle can be made that will kill large game immediately when not hit in a vital spot, and only ask for one that will send direct to the spot aimed at, with the least possible drop or variation, with sufficient force to go straight through the game. Many hunters lay great stress on a large bullet letting out the blood. Any bullet is large enough to sever the arteries, and the blood flows the same, whether inside or out; and the most fatal wounds rarely bleed much outside.

I hope that some of our repeating-rifle makers will make a rifle of the above proportions, if only for experiment, to try the range, trajectory and penetration, and let us know the result. PENOBSCOT.

Editor Forest and Stream:

I have been greatly interested in the discussion that has been going on in FOREST AND STREAM in regard to the hunting rifle, and although the subject has been almost exhaustively treated by several of your able correspondents, one idea seems to have escaped their attention.

For target shooting no one has need of a repeater, and for ordinary hunting, such as we have this side of the Rocky Mountains, I cannot see why the better-proportioned single-loading breechloader does not answer every purpose. Those who favor the repeater for dangerous game are in a fair way to obtain just what they want, for the discussion has made it apparent that one that takes from 90 to 120 grains of powder, and a bullet of from 300 to 500 grains, of from .40 to .50 and even larger caliber, is what is wanted, and the probability is that the manufacturers will supply it.

For dangerous game it does not seem to me that any rifle with but one lock is quite safe, for a gun lock is liable to fail at any moment. A hammer may break, or the firing-pin or some spring may give out, or a shell stick, and it is just at such a critical moment that the second barrel is needed. It is clearly evident to my mind that a double express rifle, all things considered, of large bore, is the arm for the sportsman to depend on while hunting large game. This rifle, if well made, will shoot with great accuracy at all hunting distances, but the trouble is, an imported arm costs so much that none but well-to-do sportsmen can afford them.

If some of our manufacturers would place on the market, or make to order a double express for about $150, the barrels of which should be so set that both would shoot alike at hunting distances, a good sale for them would be certain.

There is an art in setting the barrels so they will shoot as accurately as the high-priced English guns of course, but ingenuity can overcome all the difficulties so that a good rifle at even less than the price named, can be manufactured. Those who desire may have interchangeable barrels—one set of large caliber and the other of small, or a pair of shot barrels may fit the same stock.

I have always preferred the Maynard, on account of this feature of the arm, as the barrels may be changed in a moment. I have one barrel of .50-caliber with a slow twist —one turn in 60 inches—for round or light conical bullets, and at all hunting distanses the round bullets are perfectly accurate. The shell is loaded full (70 grains, or 100 if so chambered) with powder, and a thick leather wad, and the balls are inserted in the barrel at the breech, which when closed seats them firmly in the grooves forward of the chamber.

The .32-caliber barrel has been rechambered for Farrow's new cartridge, which, for the 115-grain bullet, gives a very flat trajectory, and is just the thing for target and squirrel shooting. He has brought out a new bullet of .32-caliber, about 2¼ diameters long, that flies with remarkable precision at all ranges up to 500 yards, but it would be better if the cartridge would take 50 grains powder, instead of 35, for that 150-grain naked and grooved bullet, and I hope to see such a cartridge ere long.

I have used all sorts of sights on my rifles, but have adopted the Lyman adjustable rear sight, and a hard rubber fixed sight in front of breech, made as described in Van Dyke's book—"The Still Hunter"—"plain and flat on top," with the addition of the platinum line down the middle of it, but not reaching the top within a twentieth of an inch, after the English method. Block tin is just as good, and will keep bright, and costs nothing. These and an ivory sight on the muzzle, or an iron or steel one faced with platinum, or block tin, complete the set. A person who is at all near-sighted and wears glasses, must have the middle sight set well forward or it will not be clear. For hunting, the muzzle sight should not rise more than three-sixteenths or a quarter of an inch, and the middle sight be so set that the point-blank will be fifty yards. Then when 100 or 150 yards intervene, throw up the Lyman sight. If longer distances are required, make the point-blank 100 yards, and set the rear sight for 150 or 200. There is nothing new in all this, but many who read the FOREST AND STREAM, have not had experience enough to have proved the utility of this simple arrangement of sights, so some of those matters bear repeating.

Some one has advocated .25-caliber, and when one is produced, I hope the cartridge will be made long enough to give a powder and bullet proportion of at least one to three, and one to two and a half or even two, would be better still, as the resultant trajectory would be very flat. A bullet well hardened would give excellent results, and a pop-gun would be secured for small game that would be first-class. I tried in vain to get good shooting from my .32-caliber rifle with the bullet that was furnished me, that had a nick at the base, and not until I altered the molds at that point, and enlarged the front of the bullet so it would seat firmly in the rifling, was it secured. This is referred to, that whoever puts a new bullet on the market, may not make a mistake in its form.

TUNXIS.

RIVERTON, Conn., March 17.

Editor Forest and Stream:

Let us have a little discussion upon the subject of hunting rifle cartridges. They do not contain sufficient powder. A proper charge of powder for rifles, from .22 to .40-caliber, will fill the bore a distance of five times its diameter, and the lead should be sufficient to fill the bore for the space of two diameters. The gun ought to weigh one quarter as many pounds as the caliber is hundredths of an inch. These proportions in cartridge and gun will give better average results than any others I have tried.

Nearly all the cartridges offered by manufacturers of less than .40-caliber, do not have a reasonable amount of powder to give the gun a possible chance of doing decent execution at a greater distance than fifty yards. If we are using a .44 gun, they are willing to do up our powder in liberal packages, 100 grains or more, but when we take out our .32 rifle, we are compelled to use squibs, or load from the muzzle.

None of these calibers are large enough for deer or heavier game. A .50-bore, with about one and a half calibers of lead, and all the powder the shooter can endure, will kill more large game than any smaller gun. However, when the caliber is enlarged beyond .40, either the gun, or cartridge, or man, is not in good proportion, and if you give the ball a low trajectory for two hundred yards, the inevitable result will be a high initial velocity of the man and *vice versa*.

Give the .32 rifle 50 grains of powder and 150 of lead and then test its shooting from one hundred to three hundred yards. L. C. C.

ST. PAUL, Minn.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

Doubtless most of the different "shotgun" reports that have appeared in the FOREST AND STREAM of late, are from actual tests, and therefore valuable, as showing the opinions of the different shooters, as well as the performance of the different guns. But when "Ogeechee" and "Mark Ivel" report killing deer, geese and ducks at 100 to 120 yards, one cannot help thinking they are writing for the first prize in the next "Camp Fire Flickerings," where facts are at a discount. Such guns—being sure death to anything they are held on at 100 yards—ought never to be fired at game till the 100 yards are passed, in order to give it at least a small chance for its life.

My experience covers over fifty years of shooting, and embraces all gauges, from 6 to 16, both inclusive, flint locks, muzzle and breechloaders, and my vote is for breechloader first and at all times; both for safety and convenience. But as to gauge, that depends entirely on the purpose of the shooter. If he shoots for the market or slaughter, he will be satisfied with nothing smaller than an 8 or 10-gauge. But if for sport and recreation, he needs nothing larger than 12 to 16-gauge. What sportsman would not rather bag a dozen birds with fifteen to twenty shells—which will be a full average, on ducks, at least—with a small gauge, rather than get the same, or twice the number, from one or two shots into a flock, with a small cannon? I say nothing of the cripples that are sure to be made in flock shooting.

At present I own but a single gun, which is a W. & C. Scott & Co. 12-gauge 30-inch.

My charge for ducks is 3½ drams powder, 1½ ounces No. 6 shot, and I am able to report a success that ought to satisfy any reasonable sportsman. J. H. D.

POUGHKEEPSIE, N. Y.

Editor Forest and Stream:

Guns have very aptly been divided into classes, and it might not be inappropriate to divide sportsmen, or rather, the owners of guns, into classes. Your practical sportsman, he who loves the invigorating and healthful exercise of true sport, that delights in ranging field, forest and stream in quest of whatsoever game may fall to his lot or share, is the type of one class. To the other belongs the man who is content with the evanescent glory of being called a sportsman. Such are the men who have owned boats they could not sail; if by any chance, cast upon their own resources, on their own craft, struck with a capful of wind, they would know not what to do; owners of fly-rods and fishing tackle they could not manage; of blooded race horses they could neither ride nor drive, and last but not least, of guns they could not shoot, or if perchance they did, it would solely be for the purpose of making a noise and displaying "a thing of beauty," but alas! not always "a joy forever."

To the latter class it is a matter of indifference, whether in point of practical performance the gun is a good one, choked or unchoked, or what not; so that it has what is rather erroneously termed a reputation, particularly if its praises be extensively sounded as endowed with all sorts of qualities which it may not possess, and moreover, if it be "fair to look upon," that is enough. Your drawing-room sportsman is ready on any and every occasion to rise and maintain the pretentions of the thing, however preposterous they may be in point of fact.

I think it may be fairly assumed that your true sportsman is, as a general rule, intensely practical; he delights in examining into the why and wherefore of things; the chief happiness and enjoyment in his pursuits depends in a great measure upon this very faculty, upon it hangs all success. His working tools must be up to the highest standard possible to attain; if they fall short in any particular, he casts about to know why, and to remedy the evil if possible. Theory to him is bosh, if the idea involved can neither be carried into practice by himself nor any of his co-workers.

It is not proper to dub such men old fogies, stubborn, prejudiced, ignorant, and all that. Ignorant we are of many things, if we knew it all we would cease asking questions or trying to learn. If the worthy experts in the art knew it all, the many faults and errors that have from time to time obtained a footing, would have been entirely done away with long ago.

In making comparisons as to performance between dif-

ferent guns, the only fair and equitable basis upon which we can act, in order to obtain any definite result, is to fire the guns respectively under the same conditions identically as to distance, size of target, weight and caliber of gun, quantity and quality of charge, and method of loading. Range, distribution and penetration can then be all or severally compared upon a basis of equality. To alter the conditions, for instance, to shoot a 4-gauge duck gun, against a light 12-gauge fowling piece, even should all other conditions be equal, would necessitate an allowance in favor of the lighter gun by reason of the enormous extra weight, caliber and charge of the larger gun.

This, I maintain, is the only way in which a just comparison can be made. The testimony of those who have at one time or other made what they consider an extraordinary shot, or who own some wonder of a gun, is irrelevant; it affords no basis for a comparison; under these latter circumstances you can scarcely compare successive shots with the same gun with any certainty; probably not a man who has handled a gun but has made some such shots; I could relate several I have made; they are abnormal, out of the usual order of things; the man may fire in mere wantonness, the excitement of the moment, or probably despairing of obtaining any other or better chance, for instance, at a flock of wild geese at a great distance, he fortunately bags one, paces off the distance perhaps, finds he has killed it at 100 paces or more, in ecstacy at his totally unexpected success he sets his gun down as a 100-yard gun, and good for that all the time. The probability is that same gun, charged in the same way and well held on the game, might be fired 100 rounds at the same distance and not bag another bird.

There is a limit, an average killing distance, at which we may expect certain results; make comparisons at that range, if the gun performs well at that, all well; you then have just as good chance for making an extraordinary long or good shot as any man with any gun whatsoever. I take it as an indisputable fact, proved by the long experience of every man who shoots a shotgun, of whatsoever style or make, that if the gun performs well and is a good strong shooter at the average range or distance, it will prove a good performer at even greater or less distances, with charges altered to suit the designs to be accomplished, provided you do no material violence to the proper proportions suitable therefor. Our best shots and most successful sportsmen frequently are men of one gun.

I cannot altogether agree with the views expressed by many that slight inaccuracies or deficiencies in loading are responsible for failure in performance. That such errors will and do affect the shooting to a limited extent I admit, but they will not produce a complete failure at both target and game.

Let us call up the old muzzleloader again at the risk of being charged with prejudice. I merely do so to institute a comparison. For several years I used a muzzleloader, 10-gauge, 30-inch laminated barrels, weight about 8¾ pounds. I have used it on the Delaware marshes shooting rail and reed birds, charging with barely an ounce of No. 8 or 9 shot, same measure or bulk (not weight) of Dupont's No. 2 duck powder. Did you run out of cut wads, utilize the old newspaper that chanced to be in your pocket. Under such circumstances I never could discover any very material detriment to the shooting. I shot away and bagged my game as usual. I used the same gun for upland shooting of all kinds; in wild duck shooting on the Sassafras and Elk rivers, loading it on such occasions to its full powers, with 1¼ ounces No. 4 shot and 4 drams powder. If using a wire cartridge for long shots, I put in every grain of powder the gun would comfortably bear. I used the same gun in West Virginia deer hunting, using a wire cartride charged with buckshot, backed with a heavy charge of powder as above, and have killed over forty deer with it. With such a charge I always considered myself sure of venison, with anything like a fair shot at 60 yards or under, and I have made a few chance shots at greater distances. I never had the least cause to complain of its performance under any of the various circumstances and conditions. I was "right there" all the time, and it was just such a gun as one could tie to.

Now, I firmly believe, and am satisfied that a good breechloader will not do as well, but much better, by reason of its many decided advantages. But, as the complaint comes up on all sides of wretched failures as to shooting qualifications, there must evidently be a deeper seated cause than a mere error in loading. My own observations and tests lead me to believe that excessive choke-boring cannot be enumerated as one of the advantages of the breechloader. It is a positive disadvantage when carried to the excess of what is termed a full choke—an abomination. I have tested some guns that would gauge 10 at the forward end of the chamber, and scarcely 14 at the muzzle, a difference in diameter or gauge of strong four sizes, with all of that choke at the muzzle, or within from a half to three-quarters of an inch of the muzzle and drawn down or rounded off quite short. This is what I presume is called a full choke. I am not equal to the task nor shall I make any attempt to use technical terms, nor to describe other systems of choke, etc. Most manufacturers of prominence have their own ideas and systems, and we can afford to take their word for whatever they represent their guns to be; but the system I have here briefly and crudely described is what will be found in the common run of guns that are called full choke. Guns bored upon this system will, nine times out of ten, prove to be greatly lacking both in force and closeness (the very essentials they are reputed to possess) and no possible method of loading them will remedy this defect where it exists.

There is a notion prevalent with many that chokeboring is a new idea, introduced and contemporary with the recent general introduction of the breechloader; this is an error, it is simply an old idea in a new dress. In some of its various modified forms it was tested and used years ago. It frequently happened that the muzzleloader shot wildly or scattered its charge too much to be effective; an examination of the bore would sometimes disclose it to be contracted at the breech, not a true cylinder throughout; the boring out of this contracted part, or probably as sometimes done, enlarging it the least appreciable degree at the breech, and drawing toward the muzzle would generally remedy the defect. If the job were overdone, however, the contrary effect was apt to result, an aggravation of the defect. This was termed by some gunsmiths drawboring, by others jugboring, and others may have had other terms expressive of the same idea.

In looking over an old volume of United States Patent Office reports, some thirty years back, my attention was attracted to specifications of a patent issued to an American gunsmith for a system of boring shotgun barrels in a series of sections of their length, alternately large, then smaller in gauge (a succession of chokes and open cylinders as it were), claiming the effect to be, greatly increased force and closeness of distribution. I don't suppose his idea ever reached much beyond the pages of that dusty record. I suppose practically the verdict was, "weighed in the balance and found wanting." So it will be with the full choke, time and a few more practical tests will decide it.

Upon the recent general introduction of the breechloader, in some inexplicable way, chokeboring systems put on new garments and took front rank; having long before been demonstrated that in some cases a small degree of choke improved and increased the effectiveness of the gun, the deduction therefrom was easy and natural; a little being sometimes good, more would be better. We at once had full choke on us, assuming the features of a popular furore. The whole thing was comparatively new to the masses. Full choke was heralded as the cardinal virtue of the new breechloader; if the sportsman had an old cylinder bore that shot ever so well, he must procure a gun of similar size full choked, and the shooting would be doubled in range, force and closeness in every point that goes to make up effectiveness; that seemed to be the popular and almost universal opinion immediately. A general demand sprang up for it at once, many stopping neither to test nor consider. As a consequence, many got just a little too much of it. Manufacturers are not to be growled at for the failures; the public made the demand; they got just what they wanted for their money. Time enough has elapsed for the ardor manifested in favor of this chimerical notion to have cooled off.

I have extended this article to much greater length than I intended, and have merely to say, in conclusion, that from the experiments some of my friends and myself have been conducting, my advice to all who have guns that are heavily choked that fail to come up to even a mediocre performance, have your gunsmith take out at least a portion of that choke, and you will be astonished at the improvement in the shooting. BACKWOODS.

BEVERLY, W. Va.

Editor Forest and Stream:

The discussion on the performance of shotguns in the columns of FOREST AND STREAM will do much toward educating young sportsmen up to the necessity of exercising care and judgment in the selection of a gun. There is everything in the "individual" gun, and more in choosing a gun adapted to the individual. Every sportsman knows what he wants for a gun, and his want is based on his personal experience, and there are very few who have had precisely the same experience. In the last five years I have experimented with at least ten guns of different make, weight and gauge, and as a result have settled down on two guns. The first for wing shooting is a Buckley hammerless, 10-gauge, 30-inch barrels, weighs 9¼ pounds, light at the muzzle, broad and heavy at the breech, and though a large gun, handles very light and easy. I load with 4 drams powder, 1¼ ounces shot, and use 3 Ely's p. e. wads on powder. I think I can show as good results with 4 drams of powder and three wads, as with 5 drams powder and two wads, and I find no wads equal to Ely's. With above load, using No. 9 shot, this gun patterns with right barrel 487 pellets, and with left barrel 549 pellets in 30-inch circle at 40 yards, very evenly distributed. I have frequently broken glass balls on a stick at 60 yards. I can fire 100 shots without the least inconvenience from recoil. This fills my idea of a gun.

My experience with a 12-gauge gun was very unsatisfactory. The gun made a very good pattern, but I had no confidence in it, and therefore no success with it. It was not suitable to my size and weight (6 feet, 170 pounds), and length and strength of arm, there wasn't gun enough for the man. I have a friend who is a short, light weight, who does excellent work with a 7-pound 12-gauge, which indicates that the gun and gunner must be suited to each other in order to obtain satisfactory results.

My second gun for all-round shooting is a Baker, three barrel, 10-gauge, 30-inch barrels, and weighs 10 pounds. The rifle takes a .44-40-200 cartridge, is very accurate, has put three bullets in succession in a 6-inch ring at 275 yards, and has killed rabbits at 100 yards; 10 foxes have fallen to the shotgun this winter, one at 75 and one at 80 yards, measured. For buckshot it excels. I load with 5 drams of powder and 21 No. 3 buckshot, and can put 18 into the forequarter of a deer at 40 yards, or 5 into an 8-inch ring at 50 yards. Would like the opinion of some old hunters on how to load a buckshot gun for deer. W. J.

BOSTON, Mass.

Editor Forest and Stream:

"California" says that he has not been able to discover the difference between one wad and two over powder. There is a vast difference with my gun, but it is in favor of one wad. I can do much better shooting with one wad over powder than two. I tried one shot without any wad between the powder and shot. I shot it in a board 18 inches square, distance 40 yards, 3½ drams powder, 1¼ ounces No. 5 shot. There were only 5 shot struck the board, and they only stuck. I would not be afraid to let "California" shoot at me at 50 yards with that kind of a load. I have been trying to get up a bet with some of the boys around here that I can kill two chickens (one year old roosters) out of three, at 70 yards, to be shot at separately, with a charge of 3¾ drams powder and 1¼ ounces No. 5 shot, but I cannot get any one to take me up, because they know what my gun will do. I have shot at a sugar barrel head at 80 yards, and put 10 No. 5 shot in it. Four of the shot penetrated the wood (sugar pine) ¼ of an inch, all of them were driven in more than the depth of the shot. My gun is 12-30-8½; there are no shell chambers in it. I do not think that the chambers are any benefit to any gun; I will shoot my gun against any 12-gauge gun for penetration, "Ogeechee" excepted. I hope this discussion may lead to good results. GREEN WING.

FREESTONE, Cal.

Editor Forest and Stream:

One thing I would insist on in this discussion, and that is accuracy, not mere supposition or guess work, will do when facts are wanted. There are many who give a gun a record because they have been successful with it afield. If you think one gun is much superior to another, the pattern paper and penetration pad will settle it. I have always thought the shell chamber or conduit from it to the barrel or bore proper was in great measure to blame for much bad shooting. My attention was first called to this in a Roper four-shot shotgun, 14-bore, in which a continuous surface (practically) was presented to the load from the time of starting until it arrived at the terminal choke. This gun astonished several fine muzzleloaders while I was hunting squirrels. I also tested it at the penetration pads and pattern paper, with flattering results, only using 2½ drams powder, 1 ounce shot. Another, a Parker gun with good weight of barrels, had been so badly neglected that rust beds had formed to great depth. I undertook to bore them out. After hard work and long boring I had nothing but a shoulder thickness of metal shell left of former taper from chamber. I could put in 30-inch circle, 40 yards, No. 8 drop shot (Tatham's), 406 pellets, and penetrate five pads of bookbinders' board with 3½ drams powder and 1¼ ounces shot, and to-day the owner of this gun would not part with it for three times its first cost to him.

Now, if we could get some of our gunsmiths to talk, it would be very entertaining, but they fear some other fellow would know just how they do this or that particular part, and they let us do the talking, knowing full well we cannot hurt any one. Loading has much to do with good shooting. I have never targeted a Colt's or Parker that I did not improve upon target record that came with gun. I would like very much to hear from the Pieper "rifled choke," and glad to hear of L. C. Smith's improvement in shotguns. We want a hammerless at $75.00, well made, good material, safe, and know it will be made before long. VOX.

MT. STERLING, Ky.

Editor Forest and Stream:

Good pattern and penetration seem to be the desideratum aimed at in selecting shotguns. I have used a great many pounds of ammunition experimenting within the last thirty years, and now for the first time to record the results.

I have owned guns with light muzzles, and my experience with them is this: The moment you commence to use anything more than a small or medium charge of powder, such guns will not make good patterns, and will sometimes swell or become larger at the muzzle, and thus become useless. A prominent American gunmaker, when asked why he did not make guns with heavier muzzles, said it was because he could not sell them, "the trade calls for light muzzles." At another time, when a gun was being examined with a view to purchase, the question was asked, "Can you choke that gun so as to make it a close shooter?" The answer was, "No, because there is not strength enough in the muzzle."

At the present time I own a chokebored 12-gauge, 28-inch breechloading shotgun, weighing 8¼ pounds, with heavy muzzle, which will make a much better pattern with 4 drams of powder than it will with 3 or 3¼ drams. I also own a 12-gauge, 36-inch, chokebored, 10-pound, breechloading shotgun, with heavy muzzle, which will make a better pattern with 5¼ drams of powder, than it will with a smaller charge. I have the best success with paper shells, and for 4 drams of powder or less I use one pink-edged, No. 11, wad on the powder, and when the charge is increased much above 4 drams, two pink-edged wads; because heavy charges of powder will tear one wad in pieces, and the pattern will be anything but good.

When guns group their shot and leave bare places on the target, I have always found that the shot used were of exactly uniform size, and fit the bore of the gun in such a manner as to have the shot in each layer in the charge fit in the interstices of the layer beneath it. The difficulty can be easily remedied by mixing two or more sizes of shot. POP-GUN.

TYNGSBOROUGH, Mass.

UTAH FISH AND GAME LAW.

THE following bill was passed March 8, 1884, by the Legislature of Utah Territory:

SECTION 1. *Be it enacted by the Governor and Legislative Assembly of the Territory of Utah*, that every person who, between the fifteenth day of March and the fifteenth day of August, in each year, wilfully takes, kills, destroys, or offers for sale quail, partridges, or grouse; or who between the fifteenth day of April and the fifteenth day of September, in each year, wilfully takes, kills, destroys, or offers for sale any kind of wild ducks, or who shall at any time rob the nest of the above mentioned birds; *or who shall kill any wild duck between one hour after sunset and one hour before sunrise;* or who shall kill any quail or any imported *game* birds or their progeny for *three* years next ensuing the passage of this act, shall be guilty of a misdemeanor.

SEC. 2. Every person who, between the first day of December of each year and the first day of the *September* following, takes, kills, or destroys any elk, deer, mountain sheep or antelope; or who shall at any time kill any of the above animals for their skins, is guilty of a misdemeanor: *Provided, that persons camping in the mountains may, during the months of July and August, kill sufficient of the males of the above animals to furnish themselves food while so camping.*

SEC. 3. Every person who buys, sells, or has in his possession any of the game enumerated in the two preceding sections, taken or killed within the time during which the taking or killing thereof is prohibited, except such as are tamed or kept for show or curiosity; and every person who buys, sells, or offers for sale the skin of any animal, the killing of which is herein prohibited, is guilty of a misdemeanor.

SEC. 4. Every person who at any time takes or kills any fish, except with hook and line, or with seine, as hereinafter provided, *or who shall catch or kill any trout in any way between the fifteenth day of March and the fifteenth day of June of each year*, is guilty of a misdemeanor. *Provided*, that seines not more than 200 yards long and twelve feet wide, with meshes not less than *one and a half* inches square for fifty yards in the center, and meshes not less than *two* inches square in the wings or ends thereof, may be used in Green River, and Bear and Utah Lakes only, between the first day of *October* of each year and the *first day of June following. Provided, further, that nothing in this act shall be so construed as to prevent any person from taking fish from the public waters of the Territory for the purpose of stocking private fish ponds, or to prohibit any person from managing and controlling his private pond or taking fish therefrom.*

SEC. 5. Every person who at any time catches or kills any fish with set line or lines is guilty of a misdemeanor.

SEC. 6. Every person who puts into the waters of this Territory any poisonous or explosive substance or anything that is injurious to fish, or that renders the water unfit for household purposes, is guilty of a misdemeanor.

SEC. 7. *Every person who at any time takes any fish from any private fish pond or stream, without the consent of the owner, is guilty of a misdemeanor.*

SEC. 8. Every person, corporation or association who shall construct or continue to keep any dam across any of the streams of this Territory in which fish migrate in such a manner as to hinder or obstruct the migration of fish to or from their spawning grounds without providing a fishway and keeping it in repair, as provided in the following section, is guilty of a misdemeanor.

SEC. 9. The fishway for the passage of fish in large streams of water, mentioned in the preceding section, must be made in the form of a box, open at each end, not less than four feet wide and three feet high, and of plank not less than two inches thick; and it must be fastened in the water at the top of the dam, and the lower end must extend to and be fastened in the pool below the dam at any angle not exceeding 35°. Inside this box, fastened at the bottom and at one end to the side of the box, there must be pieces of plank four feet apart, placed transversely so as to cause a riffle not less than ten inches high. These pieces of plank must be thirty inches long, and so fastened as to be at right angles with the sides of the box, alternately fastened, one at one side the other at the other side of the box. Whenever the stream is small, the County Court of the county in which the dam is, or is to be constructed, may permit the box to be of less dimensions.

SEC. 10. That any person, corporation or association who has taken or may hereafter take out the waters of any stream or lakes in this Territory that contains fish, shall be required to place across the head of such canal or ditch a grating of horizontal bars not more than one inch apart, sufficiently secured on the sides, to prevent fish from escaping into said canal or ditch. Failing to comply with the provisions of this section is a misdemeanor.

SEC. 11. *The provisions of this act apply to Indians who kill deer for their skins.*

SEC. 12. *All former laws for the protection of fish and game are hereby repealed.*

The alterations and additions are printed in *italic*.

FISHER ISLAND CLUB'S QUAIL.

THE Fisher Island Club has, up to date, received about five hundred and fifty quail, from Tennessee mostly. We have had them sent in four shipments, and our birds have arrived in good condition in the majority of cases, and were a fine lot.

The sexes were well matched, leaving a few hens without mates. There is quite a difference noticeable in the size of birds, showing plainly that some are of a very late hatching, while there seems to be none or very little difference in the size of the old birds from those killed here in our State.

The mortality I consider very light for so long a confinement, the birds being in cages two months and over. Nevertheless, we have not lost more than about one hundred, while I know that dealers and clubs have, for several seasons in succession, not been able to save one hundred quail out of four or five hundred. I know of one party who has lost every bird he had last season.

We have taken the best of care of our birds in every particular; have kept them as clean as possible, fed them early in the morning with wheat screening, buckwheat, and now and then some chopped beef; then watered them about 10 or 11 o'clock, and fed in the afternon some greens, sprouts, apples, field salad, etc. The water dishes were removed before the green stuff was given, and the birds had never any filthy water in the coops and cages.

I found that the birds have a habit of standing in the water dishes at night and were soiling them badly, so I came to the conclusion this was the cause of a great deal of disease among birds that were allowed this habit, and I know of some that had died with bowel diseases. Next in importance to clean water is plenty of sand and gravel, which they enjoy very much.

Most of our dead birds showed injuries about the head, or had broken legs, and were trampled to a pulp almost, in a short time. I also believe there is a good deal of fierce fighting among the birds, with fatal results, conditions over which we have no control and for which there is no remedy. Too much dry feeding kills many birds also, and green feed is enjoyed very much by them and is no doubt a better bowel regulator than bad water. We have over 400 birds yet, ready to liberate in a few days.

MAX WENZEL, Secretary.

HOBOKEN, N. J., March 26.

MUCILAGED WADS.

TWO articles have recently appeared in your columns under the head of "Mucilage-Edge Wads." Being the inventor of the wad referred to by "Sycamore," I naturally felt an interest in the subject. I have been careful to submit my wad to the examination of many experienced sportsmen, and in every case the verdict has been favorable.

Last fall I loaded forty shells with my wads, put them loosely into a leather pouch, threw it across my shoulder, mounted my horse, and galloped four miles into the country, allowing the pouch to bob freely all the while. A practiced gunner joined me, and we spent several hours in wing-shooting. About one-half of the shells were fired. On my return the wads in the loaded shells were as firmly seated as ever. Those shells which had been discharged, although second quality, and not such as the manufacturers claim can be reloaded after having been crimped, were apparently in as good condition as when first put into the pouch.

My invention consists of an ordinary pasteboard wad upon which is glued a round piece of cambric (thin, strong paper will do) about three-fourths of an inch greater in diameter than that of the disc, leaving a margin all around of about three-eighths of an inch. From four to eight equi-distant triangular pieces of the margin are cut out, preferably the latter number. The projecting portions of cambric or paper ("fulls" "Falcon" calls them) between these kerfs are thin coated with mucilage. The wad is inserted in the shell cambric down, and when discharged the parts holding the mucilage are reversed, so that the gum does not come in contact with the barrel of the gun. This is of vital importance, as otherwise the moisture engendered by the explosion would cause the gum to adhere to the barrels and quickly foul them. That would be a fatal objection to "mucilage-edge" wads; but mine is not properly a "mucilage-edge" wad. The wad proper holds no mucilage upon the edge.

I have also taken out a patent on a loader which moistens the wad automatically, facilitates loading, and will be found desirable by the fastidious sportsman who dislikes the licking business. Being a combined implement, it may also be used in loading both shot and powder.

M. S. ALEXANDER.

MOOREFIELD, W. Va.

CAMP COOKERY.

Editor Forest and Stream:

As the fishing and camping season is approaching I thought a few hints on camp cookery would not be out of place at this season. One never looks for home comforts in camp, but there are many little details, which, if attended to, render camp life more enjoyable. Cooking is one of the most important of these in my opinion. To make good coffee, I put the ground coffee into the coffee pot with cold water and set on the fire, as soon as it has boiled take it off, pour in a little cold water to settle it and it is done. Coffee made in this way pours clear and loses none of its aroma. Coffee boiled too long loses its delicate aroma. It is bitter and black, and in my opinion is unfit to drink, and I think bad for digestion. I have found it so. Two ounces or more of ground coffee to a quart of water is my rule. Try this, ye campers, and report to FOREST AND STREAM.

Few are prepared to make bread in camp, so I will dispense with directions for making same, though I can make good bread and biscuit.

Irish potatoes should be peeled and the large ones cut to conform to the size of the small ones, that is, all should be as near of a size as possible, to insure their cooking done at the same time. They should be put into the water while it is boiling, a handful of salt should be added to the water when the potatoes are put in, this will render ordinary watery potatoes quite mealy and palatable. Sweet potatoes should be cooked in the same way.

Birds, such as quail, snipe, plover and all such, I think, are best broiled. They should be dressed by picking the feathers off and drawing, then split up the back; the blood, etc., should be wiped off with a clean cloth. It improves the flavor of the bird to be dressed in this way; if washed the water is detrimental to a good broil. They should be turned frequently, until done to taste, when they should be buttered and seasoned with pepper and salt. Some people season while cooking, but if such persons will try the above way I am confident that they will always follow it. Teal duck done as above are the best thing in the line of duck that I have ever eaten. A bright bed of hickory coals is the best for broiling.

If desirable in my next will be pleased to give recipes for cooking mallard duck, making Irish stew and a few camp luxuries. K. 9.

LITTLE ROCK, Ark.

PHILADELPHIA NOTES.

SNIPE have arrived in considerable numbers in the Delaware, Maryland and New Jersey meadows, and on the grounds about our city a few have been killed. The meadows are very wet and the birds are scattered. Many geese flew over Philadelphia last week during the night. Some flocks were very low, judging from the gabble they made, which woke the writer from his sleep.

A letter from a sportsman friend residing in the Lehigh Valley states that the snow is still plainly showing itself on the northern sides of the mountains about him, and the winter has been a very severe one. Over one hundred quail trapped by their club have been kept over and will soon be liberated. Nine prairie chickens have been put out in lower Maryland, very near the same section where Dr. Pursel's birds were planted and bred. These birds will be protected by the farmers themselves, the whole neighborhood having been interested. It is unfortunate so few prairie hens were secured, and that at least fifty pairs were not liberated. The wildfowl in our river appear to have already paired off, as the flocks seen at rest on the water are broken up into couples, and indicate that before many days they will be on their northward flight. We have every indication of an early and mild spring. In the New Jersey swamps nesting woodcock have been found within a week. Baymen at Barnegat and Tuckerton state that the spring and autumn flights of redheads appear to be growing greater each year in their section. This spring the flight was enormous. The fowl, however, did not stop long, and were evidently travelers. Box or battery shooting on their regular feeding grounds may have occasioned this notable change of habit or movement. HOMO.

PHILADELPHIA, Pa., March 28.

AN EXPLANATION.

THE article under my signature in your issue of March 13, headed "A Taxidermist's View of It," was not intended as an opinion to favor any class. It was unfortunate that it appeared under that title. It, however, carried with it a meaning likely to be misconstrued by some, and thus at the outset placed the writer in the light of "a man with an axe to grind."

I do think that all law-abiding sportsmen, ornithologists and taxidermists, should have the benefit of laws that will favor their pastimes or occupations, if such laws are made as will not be detrimental to the general good.

I cannot quite agree with my unknown friend from Worcester, in FOREST AND STREAM of March 20, who would allow a naturalist or taxidermist to be unlimited as to the time for procuring his specimens. For I do believe in shutting off everybody from shooting between June 1 and Sept. 1, and it would be still better if this latter date could be made October, or even November. Exceptions to the summer shooting of all birds should only be allowed to the very few who are making a study of their food for the benefit of the general public. While I believe what I wrote March 13 regarding the time for the open season, yet I hope it has not yet come to that pass that the season must be cut so short. But it is evident, as the shooting of guns is improved and the number of gunners increase, that the time for shooting must be more limited.

The proposed Massachusetts law makes no improvement for the protection of that class of birds which most need it, the shore birds. Consider the narrow belt they have to traverse and the destruction wrought upon them as they pass leisurely by in the summer and early fall, in contrast with the quickness with which they go by in the spring. Also, how unsuspecting in summer, and how wild in spring. On every hand we learn of their rapid decrease. What shall be done? The protection of this class of birds is most urgent. Who will not do what he can to make laws that shall protect them? We all know that the summer shooting is thinning their ranks yearly. Will not the change of open season to spring help their increase? Let the shore shooters who read this paper give their opinions about it.

The laws should be kept on all of our game birds until such time as they may all be shot, for if taken off one earlier than another it permits of the shooting of everything under guise of that one. The later the law goes off in the fall the more protection it is to our small birds also, for in general when it goes off of partridges in September it gives the opportunity to every boy to kill anything he wishes to. The majority of our small birds pass south in September, and few are left after October.

Another bird demands protection at once, and that is our wild pigeon. Formerly very abundant, it is now a scarce bird except in a very few places. Probably the largest roosts left are in Pennsylvania and Michigan. When the birds begin to breed their nesting places are entered, and the birds killed in every possible way, their tails pulled out, and they are packed in barrels, large numbers of which are sent to New York and Chicago. Numerous eggs ready to be laid are taken from these birds.

What will Florida scenery be with the beautiful herons and other tropical birds exterminated? And yet the breeding places are entered and the beautiful birds slain by hundreds and thousands for the few plume feathers growing upon their backs, and also by the visitors there just for sport. The writer was informed, and has no cause to doubt it either, that an Englishman visited Pelican Island, in Indian River, with some 2,000 cartridges, nearly all of which were used on the pelicans, and he left the ground strewn with the dead. No words seem adequate in condemning such an act as this. But so it is in many other places also.

The same dates that apply to one locality will not exactly fit another. The author takes for a standpoint the Middle States and New England, between the fortieth and forty-third parallels. The North or South will require later or earlier dates.

The only object the writer has in placing himself antagonistic to public opinion is to try to assist in the better protection of our birds, and in the making of laws that shall be just to all of the gunning fraternity. F. J. TINGLEY.

TINKERING THE WOODCOCK LAW.

Editor Forest and Stream:

I notice here a bill introduced in the Senate by Senator Otis, Chairman of the Senate Committee on Game Laws, relating to Suffolk and Queens counties, limiting the partridge season to November and December, but allowing July woodcock shooting.

Allow me to ask through your columns if you know anything of the history or object of this bill?

It looks at this distance like a trick or scheme by some hotel interest to draw New York patronage thither to dine on woodcock "chicks" on the "half shell" out of season, or a pretext under which pot-hunters and law-breakers may operate over the surrounding country to supply that particular market at enhanced prices.

The subject is worth consideration, since schemes of this kind are constantly pouring in from that vicinity, to the prejudice and demoralization of the best efforts for protection.

Do the better portion of the sportsmen of these counties really desire such a law? Is it justified by any sound reason or condition of things?

If I understand the history of woodcock, they frequently hatch a second brood in July. If such be true in that section, it is a good reason against the bill, impatience of individuals to shoot before the season opens to the contrary notwithstanding.

The original game law opened the season July 4. It was changed by common consent of sportsmen as being in every way bad practice. The bill being a local one, is of doubtful constitutionality. I think the people of these counties will soon want it repealed, because there will be nothing left when August comes, and September will probably be barren of sport. Perhaps that is the very object of the law. I wait to see whether or not Senator Otis is lending his name and position to a mere scheme of this sort to gobble up my chicks. MOTHER WOODCOCK.

ALBANY, N. Y., March 20.

CRUISING IN FLORIDA.

ARRIVED here last night after a very pleasant trip by way of Clear Water Harbor, Tampa Bay and Charlotte Harbor. Found abundance of game on the way. Plover, snipe (Wilson's), curlew, humility, etc., etc., for birds; deer, 'coon and bob cats on the river. Have surfeited on wild turkey since leaving Fort Myers.

The Caloosahatchee is a beautiful river. I think it far superior to the St. Johns. Game is plenty; fish few and far between. Scenery delightful. Mosquitoes are somewhat troublesome, but nothing to what I have seen in New Jersey.

Our party consists of two gentlemen from the Hub and myself. We left Tarpon Springs, Fla., on the 20th of February bound for Kissimmee; leave here to-day by way of the canal for Okechobee. Have had glorious sport, and expect more of it. The weather is all that could be desired; southerly winds, days clear and pleasant, nights cool and sleepful Healths all are A1. Appetites good, provisions ad lib.

Any of your readers who wish a pleasant cruise and "heaps o' fun," should try Charlotte Harbor and the Caloosahatchee.

You will probably hear from me again when I reach Kissimmee, when possibly I may have more to say. Till then *addio*. TARPON.

HEADWATERS CALOOSAHATCHEE RIVER, Fla., March 14.

LONG ISLAND NOTES.—I took a stroll on the meadows the other day with my old setter to interview that mythical snipe, but he scaiped; I did not see any markings, nor borings. We have very few snipe around this locality, and ten guns for each bird. Crows are abundant and many carcasses lie on the meadows. There are a few hawks, redwing blackbird, bluebirds, robins and other birds. Meadow larks stay all winter. I have not seen any woodcock; in fact don't look for them. I hope that the sportsmen of Pennsylvania, New York, New Jersey, and Conneticut will unite and abolish spring and summer shooting. October 1 is early enough. I wish that all clubs would offer bounties for owls, hawks, skunks, foxes, weasels and snakes. This would help increase game mightily.—FRIAR TUCK (Flatbush, L. I., March 21.)

I fail to agree with your correspondent, signed "16-Bore," in your last issue, who writes of summer woodcock shooting. I have always been in favor of July shooting. And as far as my experience goes, have found the birds well grown, and frequently able to fly well by May 1, and if we miss the July shooting we miss all, as we never get any fall shooting. He speaks of the partridges being diminished by summer woodcock shooting; it may be so in some localities, but not here. We might have some of the best partridge shooting in the State of New York if snaring could be prohibited. I have known between two and three hundred partridges per week shipped from this depot to the New York market, and between two and three thousand during the months of September and October, and so long as the season continues to open September 1, the snaring will continue, and I know of no reason why the law should not be amended for the season to open November 1, or at the same time of quail shooting, as then the partridges would be preserved, and not snared under cover of killing to escape the penalty of the law. This is applicable to Queens and Suffolk counties.—G. W. R. (Manorville, L. I.). [We have seen very good woodcock shooting on Long Island in October and November. There is no doubt that, were spring and summer shooting abolished, birds of all kinds would sensibly increase.]

HE AGREES WITH "CHASSEUR."—Allow me to applaud "Chasseur" in his utterances anent the improved breech-loading rifle, .44-90-500-60-496-393¼ craze. What in the name of common sense is anything more effective than we now have, or as much so, needed for? Simply to add to already plethoric bags and to utterly annihilate game. This it is, pure and simple. Better far were it, for keen enjoyment and satisfaction, that there were no repeating rifles. If it were absolutely necessary for the glory and renown of Me Lud, or anybody else, to penetrate the fastnesses of the mountains in search of the cougar and grizzly, let him take his life and singleshot in his hands and fight it out on that line. It is entirely probable that some dudes would turn up missing, but that wouldn't hurt. It is a characteristic American idea to get all that is to be had in the shortest space of time, whether in domain of sport or business. It is unhealthy. The candle burns too fast. Call a halt.—S.

DUCKS IN IOWA.—Marshalltown, Ia., March 27.—Ducks are beginning to come in in goodly quantities, but so large a territory is covered by water that one cannot get near them. —L. T. D.

NORTHERN MINNESOTA NOTES.—As may be imagined, bird life in this boreal clime is not very abundant, it being not uncommon for the thermometer to be 30 and 40 degrees below zero, and once this winter it has registered 52 degrees below. Prairie chickens, or pinnated grouse, and sharptails, stand the cold well here and are abundant. They roost in the snow, and also remain there during a blizzard. The bluejay can be heard uttering his chatterings on most fine days, that is, with the thermometer about zero in the shade. The chickadee endures the severest cold bravely, and is as pert and merry as though it were forty degrees above. The red-headed woodpecker is found tapping the trees, in the bush which borders on the rivers, during the severest storms. Snow buntings are to be seen here every day now, they are becoming rather mottled in color. A month or six weeks ago, the markings were confined to a very slight blotch on the nape of the neck and shoulders, and some were so slightly marked that they appeared to be pure white. These birds before a storm are particularly active, and flock around the homesteads, uttering a sharp, twittering note. Only last December a bear of the red nose species was killed, eight miles east of here. It was found in its winter den, weight 300 pounds; exactly the same appearance as the common black except two or three inches of the muzzle, which was a rich chestnut brown color. They are said not to be uncommon, but are more fierce than the common blacks. Perhaps some of the readers of FOREST AND STREAM can tell me whether this is a distinct species or merely a variety of the common black; if the latter, what originally produced the variation? Question for Darwinian devotees. At least twelve species of birds, and possibly more birds winter here, but I cannot positively identify more than I mentioned in these notes till I get "Coues's Birds of Northwest."—BOREO MINNESO. (Hallock, Kittson county, Minn., March 18). [The "red nosed" bear is the common black bear. Almost all black bears have tan or chestnut muzzles. Those without these markings are the exception to the rule.]

A KENTUCKY GAME BILL.—By a vote of 42 to 32 the Kentucky Legislature has passed a game bill, of which the following is a synopsis: It provides a penalty for hunting or having in possession any fawn or deer between March and September; turkeys between February and September; ducks, geese and teal between May and August; woodcock between February and July; quail, pheasants, etc., between Feb. 1 and Oct. 15; doves between February and August. Hunting song or insectivorous birds is prohibited, except where they are destructive of fruit or grain crops. Rabbits and squirrels are protected, except when they are destroying crops. An amendment forbidding the selling of game from other States during the close time was passed, as were other amendments excepting certain mountain counties from the provisions of the act. It is stated that this game bill was prepared after careful consideration by the Louisville Sportsman's Club, the Newport Club, the Daviess County Hunting Club and the Shelbyville Gun Club, and embraces the best provisions of similar bills in other States.

SPRING IN KENTUCKY.—I have inquired carefully of the farmers concerning the partridges (*Ortyx virginianus*), and have not received a single bad report. They have wintered well and many fine coveys exist throughout this country, although we have had one of the severest winters known in this latitude for over thirty years. Ducks have passed, with good shooting on water courses. Snipe (*S. wilsonii*), in fair numbers; two of our club bagged, in half a day, thirty-two last week, and two others did not bag so many is the writer's recollection. Our legislators have passed a good game bill. Inclosed is synopsis. I hope they may make a fair appropriation for our fish work. Spring is here, grass green, and a certain something in the air that causes a careful inspection of fishing tackle and inquiring after the stage of water in adjacent streams, and all the small boys of a Saturday and little niggers every day are sneaking to some pond or stream with pole and string. To follow soon is the intention of—VOX (Mt. Sterling, Kentucky, March 24).

SPRING SHOOTING IN JERSEY.—I was out for snipe Tuesday, and considered myself lucky; I bagged three English snipe and one gray duck. Snipe were quite plentiful, but the meadows were overrun with poor shots and still poorer dogs, flushing everything in the neighborhood. In the evening I thought I would try for ducks, supposing I would be the only one on the meadows, but, bless you, there were three hunters for every duck I saw, and still worse, they would shoot at ducks three miles up, frightening them so that I don't suppose they returned, at least I did not see them. Coming from the meadows after dark, I flushed two English snipe, but I could not see to shoot. Heard a few woodcock "squeaking" last night.—16-BORE (Madison, N. J., March 27).

LONG ISLAND PROTECTION.—I am heartily glad to find in your issue of March 10 another letter bearing upon game and game protection, and being one of the many who enjoy a few weeks of fall shooting, and who are opposed to the destruction of our birds, am very happy to hear from our friends Messrs. Lane and "C." (Manorville). In the issue of March 27, I see that Mr. Whitaker attempts an explanation why the offenders are not brought to justice. I would suggest to that gentleman that inasmuch as his jurisdiction is so large that he cannot attend to the vast amount of miles at one time, let him, while there is no land shooting, attend to our bays.—DICK (Brooklyn, March 29, 1884).

FLORIDA SHOOTING.—The fishing in Lake Monroe is very fine. Mr. Benson, of Brooklyn, N. Y., caught seventy-eight bass in the lake several days ago. Hunting is also good; deer are found in the scrubs, which are three miles from here. Ducks are not as plenty now as they were in December, but enough can be found for a day's shoot. A flock of over seventy geese passed over the lake Wednesday on their way north. Any person wishing good duck shooting should come here in October.—G. G. J. (Enterprise, Fla., March 24).

MINNESOTA.—The ducks have already arrived. Though there are but few just yet, in three or four days we will have them down on us by thousands if the weather continues warm, as the river is just breaking up.—A. W. S. (Long Prairie, Minn., March 28).

MARYLAND.—Fair Hill.—First snipe here March 26. They are more plentiful this year than for several years.

THE NEXT MAN TO DIE is just as likely to be yourself as any of your neighbors, and unexpected death is continually happening. Take a combined life and accident policy in the Travelers, of Hartford, Conn.

Sea and River Fishing.

OPENING THE TROUT SEASON.

THE opening of the season for trout on Tuesday last sent many anglers from the city to Long Island, but does not seem to have disturbed the even flow of events in other parts of the State. The evening before the opening we stood in the station of the Long Island Railroad at Hunter's Point, which the road has tried to deodorize by calling "Long Island City," and at 4:30, when the trains were about to depart for the South Side, the North Shore, Port Jefferson branch and the main line, we counted seventy-eight rods passing the wicket-keeper. Besides this, we nodded to a score or more of anglers without rods, who were going down to the clubs, where their tools were kept. How many went by the way of the Brooklyn station, or by earlier or later trains, we do not know.

On Wednesday morning, we came in on the Port Jefferson branch, and examined several fine baskets of trout, taken along the North Shore. We saw a fine specimen of two and a half pounds, which was taken by Mr. Henry Smith from the ponds at Glen Cove. Mr. John Cashow had a good creel taken from Shoe Swamp brook, one of which weighed one and a quarter pounds. The day was cold and blustery, and not at all a desirable one for trouting. The South Side Club was well represented on the road the evening previous, and the waters gave up some exceedingly fine specimens.

In the city the display in Fulton Market brought a crowd of visitors, as usual. Among those we recognized at Blackford's were: Henry Ward Beecher, Henry Irving and Miss Terry, Prof. Bickmore, of the American Museum of Natural History; Prof. Rice, of the Fulton Market Laboratory; Monroe A. Green, of the State hatchery at Caledonia, Hubert O. Thompson, Prof. A. M. Mayer, Dr. Kingsbury, Francis Endicott, John Oakey, William Mitchell, Erastus Corning, Jr., John J. Bloomfield, James Vallotton, George Shepard Page, Thomas Jones, and many others.

Mr. Blackford's slabs and tanks were given up entirely to trout, and the display, while not so great perhaps in point of numbers of trout, exceeded that of any previous year in the variety of species. The decorations were very tasteful. Over the door hung a great floral bass, with a body of red roses, fins of white daisies, and a stripe of yellow buttercups. All the woodwork and railings of the various stalls were twined with smilax, and between the loops hung dainty little Japanese glass acquariums in which tiny minnows wriggled merrily about. The larger glass boxes were banked in ferns. The white axolotls were quite lively, and were always the center of a curious crowd. If the two alleged white elephants now in the country are "sacred," then certainly these animals, which are really white, are entitled to some consideration. One of them stood on his tail in a corner of the tank all the morning, with his hand folded over his breast and an expression of sanctified grief upon his countenance, which excited much pity and sympathy from the ladies.

Among the fish the post of honor was awarded to some Irish trout from Lough Neagh, sent by Mr. T. J. Moore, of the Liverpool Museum, one of which weighed eight pounds. A fine salmon from the same place was also shown. The Cold Spring hatchery of the N. Y. F. C., F. Mather, Superintendent, sent live German trout one year old, which were greatly admired, and also fry of the same ten days old, rainbow trout of one year, and salmon fry. The Caledonia hatchery of the N. Y. F. C., S. Green, Superintendent, sent dead brook trout, rainbow trout and hybrids, all fine specimens, of two to four years old.

The best display was made by James Annin, Jr., of Caledonia, N. Y., who exhibited silver trout, brook trout, lake trout and rainbow trout, all alive, and of large size, as well as trout eggs in a package to show the mode of transportation. The United States Fish Commission exhibited live Rangeley trout and rainbows. Other exhibitors were: G. H. Dickerman, New Hampton, N. H.; Myron Green, U. S. F. C., Baird, Cal.; E. B. Sutton, Babylon, L. I.; South Side Club, L. I., and J. B. Hewlett, Hewlett's Station, L. I. Wild Canada trout were on hand, and could easily be told by their dark color. They had evidently been frozen.

Mr. Blackford sent duplicates of everything to Prof. Baird, who made an exhibition of trout in the National Museum at Washington, on Wednesday. Specimens of each kind were also sent to Lauber's restaurant in Philadelphia, where a display was also made. Taking all things in consideration, we regard the trout show of this year as equal to, if not superior, to any former one.

MICHIGAN LAKES.

THE Michigan fish law says: "From now until June 15 next it is unlawful to catch any black, green, silver, rock, or white bass, pickerel, pike, salmon, grass bass, sunfish, perch, or any food fish. Parties fishing through holes in the ice please take notice, as the State Fish Commissioners are determined to prosecute any one so doing."

How well the law is enforced I will not say; of the open and flagrant violations I can speak from personal knowledge. The labors of the Fish Commission are bearing fruit. Scarcely a day last summer that the crew of the United States Life Saving Station did not haul shore seines of one and a half and two inch meshes that caught hundreds of small whitefish from one-half to one pound weight, herring, perch and any and all that came into the net. Swedes, Polacks and other foreigners likewise are seiners.

Ausauble Lake, twelve miles long, and one of the largest inland lakes in the States, is alive with fish, which will soon be cleaned out. A lumber company some years since dammed the outlet, and no fish that comes out of Lake Michigan can get above the dam. Last spring the outlet was literally jammed with fish trying to get up to spawn. They were speared, clubbed and netted by the wagon load. The past winter the lake has been covered with the shanties of the spearing and netting gangs. Gill and trap nets are all over the lake. The daily catch averages two tons of fish, which are shipped to Chicago, Detroit, etc. Very few are sold to local marketmen.

Birch Lake is now being raided by the advance corps of the Detroit fish monopoly. This lake is the one alluded to by the Detroit dailies as being the recent discovery of a Buffalo firm, which had given the Detroit fish firm the agency of handling the enormous catch of fish the lake was said to contain. We are of the opinion that the Buffalo firm is a myth, and as for the lake being away in the Northwest, I think that Ed. Gillman, of Detroit, will say that Birch Lake is in Michigan. I may be mistaken in regard to Mr. Gillman's knowledge, but am inclined to think he has fished those same waters. Perhaps "Delta" could throw some light upon the location of the lake. To satisfy the insatiable maws of fish dealers one by one, all of our Northern lakes are cleaned out by persons either directly or indirectly connected with some firm of fish dealers. One of our Commissioners, Mr. Kellog, resides in Detroit, perhaps he could enlighten the readers of FOREST AND STREAM why this slaughter from year to year goes on without an effort being made to stop it. Not till the sale of fish is stopped during the close season for Michigan fish will the end come. A few prosecutions aimed at the heads of the fish dealers will check the slaughter.

S. E. B.

MANISTEE, Mich.

TROUTING ON THE BIGOSH.

THE DOCTOR'S STORY.

THE Doctor and I had exchanged our wet clothing for more comfortable garments, while listening to the Colonel's chaff, and were snuffing the odors of our trout which Jack had dressed, while Uncle Ben was making the bread and coffee, which were sending savory odors from the frying pan, making hungry fishers impatient of not only minutes, but seconds. The Doctor sententiously remarked that eating was a duty that we owed to our grosser natures, and that he was ready to meet his liabilities in this line at the earliest possible moment, and he had no sooner declared his readiness than Uncle Ben gave him the opportunity. How many trout and hot biscuits were eaten I will not say, because I did not keep count. The Colonel, next morning, pretended that he had kept tally, and produced a stick notched on two sides; one side of which he declared was the Doctor's record, while mine was on the other. If he ever publishes this record I ask that judgment be suspended until mitigating circumstances on our side can be shown, and besides it will not do to tie too fast to the Colonel's statements, or his stick.

After supper we stretched ourselves on the hemlock boughs and smoked, one of the party declaring himself "too full for utterance." The sun had gone down, and the strange call of the whippoorwill on the hillside seemed to rejoice at its disappearance.

"Doctor," said Jack, "tell us how you fish a stream."

"My son, beware," exclaimed the Colonel, "you do not know what an infliction you may bring on us. If the Doctor gets started on that subject, there is no telling when he will stop."

"That's so," said I, "there is no end to the Doctor's stock of fishing lore. He is chock full of information now, and you can make it flow by tapping him with a question, but the trouble is that you cannot turn the stream off as easily as you turn it on. I think we will have to let it flow and listen to it, or hoop him to keep him from bursting."

"Gentlemen," calmly answered the Doctor, "my young friend has asked me a question about stream fishing. My answer may be of use to the boy, if not to any confirmed boat-fishers and grovelling bait-fishers who might be near. He is young in angling and should be allowed to learn that the highest form of angling to wade a stream."

The Colonel repeated, "boat-fisher," and pointed at me; "grovelling bait-fisher," and said: "That rubs us both hard, doesn't it? But, Doctor, spare us, please, all the hackneyed mush about the 'indescribable turn of the wrist which cannot be explained, but which the born angler instinctively knows,' and we will listen and try to profit by your talk to Jack."

The Doctor looked up in surprise, and asked: "Do you deny that a turn of the wrist will hook a fish?"

"No," replied the old soldier, "I don't deny anything you may state about fishing, only that striking a fish by an upward and backward turn of the wrist has been magnified into an art that only few can attain, if not born with it, and against that nonsense I wish to enter a demurrer. The facts are, as I believe, that nine fish out of ten hook themselves, and the tenth one gets away. The mysterious 'turn of the wrist' is easy enough to explain, or to perform, but the stroke is too late to be of service; a fish seen to break water has the hook in his jaw or has cast it out before the motion of the wrist has obeyed the command of the eye and has communicated its action to rod, slack line and hook."

"We differ so radically on this point," said the Doctor, "that there is no use in arguing it by the camp-fire. Come with me on the stream to-morrow and we will try it there."

"No stream-fishing for me, with my rheumatic leg," replied the man of war, "but don't let me interrupt your talk with Jack, his mind is a blank on stream-fishing, and you can give him page after page of whatever you wish to print on it, and he will never be as critical as his parent."

"Well, Jack!" began the Doctor, "these two companions of ours are wedded to their idols and it would be time wasted to try to convert them. To you, however, I will say that fishing for lake trout is about as much sport as dredging for oysters, and boat-fishing for brook trout is merely a refinement of sitting on the corner of the dock and bobbing for eels. In wading a stream all the muscles are called into play and the mind is strung so tightly with anticipation of a rise, new views and surprises, care where the feet are planted, and watchfulness that the bushes do not capture the flies, that there is a sense of generalship in steering clear of all dangers and in capturing your game. Perhaps the best way to illustrate this is to tell you how I fished the stream to-day, from its mouth to its head, where I met our friend, the boat-fisher, who, unfortunately, thought the stream longer, and had aimed to strike it higher up and missed it.

"To begin with, the day was favorable; the light night before had kept the fish quiet by the bright moonshine, and the cloudiness of the day raised their courage to seek for food. I started in from the mouth of the stream and took a few fish in the first pool without much trouble from trees, as the pool was deep and wide, but taking the bank around this pool, I came to a smaller, shallow pool overhung with bushes. Here I could not cast over twenty feet, and as my rod was nearly half that in length, it was done in this way: I took my fly, for I used but one in such a thicket, in my left hand, and holding my line with the forefinger of the right hand, I held the rod parallel with the surface of the water, and drawing back the fly until the arch of the rod would throw the fly by its springing to the natural position, I let go. Several casts of this sort brought a trout out of this pool. Passing on up stream a cedar log was found with one end in the water and the other end on the bank. A bend in the brook threw the current under the end that lay in the water, and consequently a hole must be washed out under it; taking the opposite bank I stepped ashore, and advancing cautiously so that no jar should alarm the fish, the fly was dropped above the log and played on the surface, and two fish captured by keeping a taut line and not allowing them to get under the log. A third fish succeeded in reaching the timber and escaped with the fly and half of the leader.

"What fly had you been using all this time?" inquired Jack.

"A yellow drake, for the day was dull, and the overhanging bushes deepened the shade, and in such cases a light fly is usually the most killing. After losing this fly I put on an oak fly, a small fly with a yellow body and a brown wing, although I had more of the kind lost; I cannot say why the change was made, unless to try the merits of the two, and I cannot say which proved the most killing on this day. There are no doubt certain flies which are adapted to different days, although there is much nonsense in the rules laid down by different persons, and these rules vary as much as the persons. The idea that each month has its own killing flies is sheer nonsense, a fly that is good on a bright day in the spring is good on any bright day, although it must be admitted that trout are fickle in their tastes."

Here the Colonel snored so loudly that I was aroused from what I considered merely a lethargic state, but what both Jack and the Doctor declared was sound sleep. Our heated debate over this question roused the Colonel, who said: "Go on with your story, Doctor, I'm listening," and was indignant when the party laughed at him and accused him of sleeping.

"I haven't slept a wink," said he. "I know what you were talking about. You were telling Jack that a light night followed by a dark day made the fish feed."

"That was an hour ago, wasn't it, Doctor?" said Jack.

"Well, it's all the same, I heard it; but for goodness sake let up on that dry, musty old lecture, and sing us a song. What do you say?" (This question to me.)

"A song by all means. We can hear all the lectures we want at home, curtain and other, but a camp-fire is no place to bore a man with 'turns of the wrist,' and how the big one would have been caught if it hadn't been for the turn he gave the leader around the root.

And so it came to pass that the Doctor's lecture was cut off and he was made to sing, for both the Colonel and myself vowed that we would not be bored any longer. I told him that we—for I knew that I had the Colonel to back me—liked to catch trout, real live trout, or to see him take them, but to sit and hear a man catch post-mortem trout, which no one but himself enjoyed, was more than we could stand, in camp at least. He took the hint and behaved as decently as any of us during the remainder of the evening.

FRED MATHER.

GOOD WORK IN MASSACHUSETTS.

THE Committee on Fisheries of the Massachusetts Legislature, has reported a bill making the close time for trout and land-locked salmon begin September first, instead of October first, as under the existing law. This will make the season for catching these fish begin April first and end as above. The bill is altogether likely to become a law, as it will meet with but little opposition. The marketmen will not oppose it, since they have not been in the habit of doing anything in September trout. It has been generally agreed among the friends of the trout that so scarce have these fish become in Massachusetts, that another month should be put on for their protection.

A hearing was had on Tuesday, before the Committee on Agriculture, in regard to the lobster question. A close time is earnestly desired by those who see that the lobster is disappearing before continuous fishing, but such a provision is opposed by fishermen and dealers. There is little prospect of getting a close time at present, though other sea-board States have one. But those who would save the lobster hope to have the Commissioners of Inland Fisheries made to have charge of the lobster also. The present lobster laws of the State are easily evaded, for the reason that there are no officers vested with authority to look after them. With the Fish Commissioners in charge, it is believed that much of the illegal catching and selling can be stopped. The existing laws of the Commonwealth forbid the retaining of any female lobster bearing eggs, caught when fishing in the month of July. But the fishermen evade the law by brushing away the eggs with a corn brush, although the law provides that such lobsters must be immediately returned to the water alive, under penalty of not less than $10 nor more than $100, or by imprisonment in the house of correction for not less than one nor more than three months. The law prohibiting the sale of lobsters less than ten and a half inches in length is constantly broken for the want of proper officials to enforce it. Indeed, its enforcement has been for some time spasmodic, being done by the earnest friends of the protection of the fish, during intervals of business and moments snatched from business, when reports of glaring breaches of the law come to their ears. At such times the dealers have generally succeeded in hustling the small lobsters out of sight, and escaping the punishment.

SPECIAL.

BOSTON, March 31.

THE DOWEL QUESTION.

Editor Forest and Stream:

I notice in your issue of Feb. 21 a letter from Mr. H. P. Wells, of New York, deprecating the use of the dowel pin in fly-rods, as having a tendency to weaken the joints, and also on account of the difficulty experienced by an amateur in repairing a breakage when angling at a distance from a professional rod maker. I will not attempt to follow your correspondent in all the imperfections and difficulties he refers to, but may say that I have a rod which is so constructed as to obviate all the difficulties referred to. It is fitted with the new waterproof lock joint, patented by Mr. E. Perk, and purchased from a local firm, in which is now vested the sole right to manufacture.

The patent lock joint referred to possesses all the advantages of the "Irish screw ferrule" without its disadvantages. Instead of the screw, a stud is placed on the inner or male ferrule, which fits into a groove in the outer or female ferrule, thus making it a perfect lock and waterproof joint without weakening the rod; it is moreover readily adjusted without the tediousness of screwing as in the Irish ferrule, it is impossible for it to get out of order.

The ferrules are tapered as in the case of ordinary ferrules, the "dowel," which is the great source of weakness in ordinary rods, is superseded by a small stud at the end of the inner ferrule, which only requires a bore of one-third of an inch instead of one and a half, and sometimes two inches, and thus adds considerably to the strength without interfering with the pliability so necessary in a good fly-rod.

As an angler and lover of a really first-class fly-rod, I send you these remarks in reply to your correspondent, as likely to benefit my brother anglers.

ANGLER.

REDDITCH, England, March 3, 1884.

COMPARATIVE WEIGHTS OF FLY-ROD MATERIAL.

BELIEVING that to some of your readers exact information in reference to the comparative weights of the more commonly used fly-rod materials, would be of interest, the following specific gravities were computed with the kind assistance of Mr. E. S. Hopkins and Mr. W. G. Levison, of the Cooper Institute Laboratory.

Distilled water was the standard. The determinations were made with great care, and are believed to be reliable, for the specimens tested, to within at least the third decimal place. Different samples of the same species differ somewhat from one another in weight. The woods which were the subject of this experiment, were carefully selected for the express purpose of fly-rod making, and were, as far as was possible, the very best of their kind. It is, therefore, believed that the following determinations more correctly represent the comparative weights of such material as is used for this purpose, than would any samples selected at random in the wood market, or any table computed therefrom.

The split bamboo was of excellent quality, of my own preparation. The six-strip hexagonal piece was taken from an old and well-tried middle joint. The angles of this were slightly rounded. The four-strip piece was put together with the rind inside for the purpose of comparison.

The cedar was taken from a very choice piece from Florida.

The different materials are arranged in the table in the order of their weights, the heaviest first. To facilitate comparison on the part of such as may be unfamiliar with the use of specific gravities, the weight of a cubic foot of each is also given, in pounds and hundredths of a pound.

Material	Specific Gravity.	Weight of one Cubic Foot.
Snakewood	1.3718	85.74
Bethabara	1.2140	75.98
Greenheart	1.0908	68.18
Lancewood	1.0335	64.59
Split bamboo, 6-strip, hexagonal, rind outside	0.9915	61.96
Split bamboo, 4-strip, rind inside	0.9678	60.49
Ironwood (hornbeam)	0.8184	51.15
Hickory	0.7963	49.78
Ash	0.7786	48.66
Mahoe	0.6607	41.29
Cedar	0.6396	39.98

At the first convenient opportunity it is proposed to compute a table of comparative elasticities. Will some of your readers be kind enough to supply me with a piece of first-class ironwood (hornbeam) for this purpose? It should be from three to four feet long, and so as to admit of being planed to a true square of three-eighths of an inch. Similar pieces of the smooth and shag-bark varieties of hickory would also be thankfully received. But to be of any value for this purpose the wood must be well seasoned, and fairly represent the merits of the species to which it belongs.

HENRY P. WELLS.

NEW YORK, March 29, 1884.

IT WAS LEGAL.—The paragraph in your last issue, from one "C. G. G.," is entitled to a reply from its embodying a slander upon a gentleman, Mr. Hannibal Hamlin. Mr. Hamlin did not go to Moosehead Lake, but to the West Branch Ponds, some few miles from Katahdin Iron Works. He brought home a few dozen small trout, which, as a citizen of Maine, he had a right to take under the following law: "Provided, however, that during February, March and April, citizens of the State may fish for land-locked salmon, trout, and togue, and convey the same to their own homes, but not otherwise."—E. M. S. (Bangor, Me., March 23).

PHILADELPHIA NOTES.—The big shad seine at Gloucester, N. J., fishing shore has been overhauled and tarred, and wise ones expect a much better season than last year. An exhaustive lecture on "The Fishes of the United States" was given several evenings since before the biological and microscopical section of the Academy of Natural Sciences by Mr. Lockington. The lecturer used preserved fishes to the number of one hundred and more to illustrate his lecture, and it is hoped he will be induced to continue these discourses.—HOMO.

GOLD MEDAL AT CALCUTTA.—We learn that Messrs. S. Allcock & Co., of Redditch, England, have received at the Calcutta International Exhibition for fish hooks, fishing rods, and fishing tackle, a gold medal and first class certificate, this being the highest award.

Fisheculture.

PROGRESS IN FISHCULTURE.

THE *Century Magazine* for April contains an article entitled "Progress in Fishculture," with twenty-three illustrations, by Mr. Fred Mather. It shows what has been done in the last ten years, both in Europe and America, in the way of implements to simplify the work, and notes the important steps in bringing new fishes to yield their secrets of propagation to the fishculturist. No attempt is made to give statistics of the numbers of fish hatched in any land, as the different reports of governments and States furnish these. The article is written more to show the general reader what has been done than to enlighten the expert, and this is all that can be expected in a popular magazine article.

The limits of the article forbid more than the briefest mention of the many noteworthy things which have been done and discovered within the last ten years, and the only thing of importance which seems omitted is the introduction of the trout of Europe, *Salmo fario*, into America, from both Germany and England, and which promises to be of great value. Possibly the article was in type before the arrival of these fish.

There are so many things of interest to the fishculturist in the article that we cannot select any for quotation, those interested will read it. In closing it says that fishculture "has not cheapened fish food to any extent, owing to the growth of population, but it has increased the supply in American waters, which were becoming exhausted in both the older and some of the newer States, and promised to become entirely barren. It restored the salmon to the Connecticut River, where they were taken and sent to market for three years, until the rapacity of the fishermen exhausted the supply by cutting off the fish from their spawning grounds. It has placed shad in San Francisco markets, where they were before unknown, and has materially added to the supply of our lake and river fishes, and now promises to increase those of the sea coast."

The illustrations and diagrams show most of the important points described, and, like all of the *Century's* work, are well done. The picture of the New York State hatchery at Caledonia, was made just before the new building was put up, therefore the latter is not shown. "Jagging salmon," and "stripping shad," are good character sketches.

SALMON AND TROUT FOR WESTERN NEW YORK.—On the 25th of March the transportation car of the U. S. Fish Commission left the hatchery at Wytheville with salmon for the tributaries of the Oswego River. On the way 250 rainbow trout, 50 Rangeley and 50 common trout, all one year old, were planted in a tributary of the Shenandoah, in Clark county, Va. The stream was a limestone brook which is well preserved, and Col. McDonald thinks that these yearlings will prove of as much value for stocking purposes as one hundred times the number of fry. The car then went by way of Harrisburg and Williamsport to Oswego, N. Y., where it was met by Mr. Lester Wright of the Leather-Stocking Club, and 500 yearling rainbow trout were placed in Lewis Creek, a stream controlled by the club. Three miles above Fulton 70,000 Penobscot salmon were placed in Eleven-Mile Reach, near the mouth of Ox Creek.

TROUT IN WISCONSIN.—The State Fish Commissioners deposited 40,000 young trout in the streams in this vicinity yesterday, March 25. Waupaca has some fine streams in a radius of eight miles that are suitable for trout, and we anticipate fine fishing in a few years, if the fish do well, and we have every reason to think they will.—C. F. C. (Waupaca, Wis.).

THE PENNSYLVANIA COMMISSION.—The Fish Commission of Pennsylvania has nearly finished the work of removing the fish from their abandoned station at Marietta to the new hatchery near Allentown. They have begun the distribution of trout from their western hatchery at Corry.

The Kennel.

FIXTURES.

BENCH SHOWS.

April 3, 4 and 5.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio. Entries close March 24.

April 22.—The St. Louis Gun Club's Bench Show, St. Louis, Mo. Entries close April 14. J. M. Munson, Secretary.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1010.** Volume I., bound in cloth, sent postpaid, $1.50.

EASTERN FIELD TRIALS CLUB.

Editor Forest and Stream:

The quarterly meeting of the E. F. T. C., for social intercourse, exchange of views and experiences, and to promote friendly discussions on general shooting topics, has been postponed until May, and will be held some evening during the holding of the New York show, at Madison Square Garden, and notice will be given through the mail one week previous to every member. This postponement was effected to give many of our non-resident members, who will probably attend the show, the opportunity of meeting the club members while in New York.

WASHINGTON A. COSTER, Sec'y and Treas.

FLATBUSH, March 29.

I. C. S. ASSOCIATION.

Editor Forest and Stream:

Please publish the following notice to the members of the International Cocker Spaniel Association:

In accordance with the provisions of the constitution and by-laws of the above association there will be an annual meeting of the I. C. S. Association at Natatorium Hall, in the city of St. Louis, on the 22d of April next, during the bench show to be held in that city. The executive committee of said association will hold its annual meeting on Wednesday evening, April 23 at the same place. As business of importance will be presented it is hoped that every member of the committee will be present. The judiciary staff, as provided for by the constitution, should be elected at this meeting.

E. C. FRANKLIN, Sec. and Treas.

ST. LOUIS, March 28.

CHAMPION BEAGLES.

Editor Forest and Stream:

Being an admirer and owner of beagles I should like to ask for an expression of opinion, from those interested, upon the following subject, and that is asking our bench show managers to adopt a different rule—to apply only to beagles—than the one already adopted, which is as follows: "A dog to compete in a champion class must have won a first prize at * * * and a dog having won a prize at any of the above named shows cannot compete in an open class when there is a champion class for its kind, but must compete in such champion class." For the following reasons I think under the rule quoted it cheapens the honor champion, for, as is very often the case, a dog is entered in the open class with perhaps only one or two (sometimes none) competitors, and being the best of the class (at times a poor one), is awarded first prize. When the dog is entered again for competition it must enter in the champion class, when the same thing might be repeated, and it win in that class, then it is proclaimed a champion beagle. I think it will be to the interest of the admirers of the beagle to adopt a rule having a dog win two or three times (two at least) in an open class before competing in a champion. I, as an exhibitor, would willingly agree to such a rule, and would then look upon them with pride, and value a dog who won champion as one who was entitled to the honor. It is for the breed I am writing and not any personal glory (for I have won twice in the open classes with Bush and Myrtle), and under such a rule dogs would find their proper places.

W. H. ASHBURNER.

POINTERS AT CINCINNATI.

Editor Forest and Stream:

In your issue of the 13th inst., under the caption of "Setters and Pointers at Cincinnati," Mr. Munson says of Lamplighter, who got a vhc. (a Ranger ex Queen), "He is a good looking, big dog, but coarse, as the general run of Ranger dogs." While he has an undoubted right to give an honest opinion of dogs that he has seen, and those exhibited more particularly, I do object to an erroneous impression being given of what has not been seen—"the general run of Ranger dogs." (Your report of Lamplighter says "he was a very useful looking dog.") The Ranger dogs are too well known among practical sportsmen who use them afield to not appreciate that quality Mr. Munson terms "very coarse." The many first prize winnings at bench shows held at Chicago, New York, St. Louis, Boston, Baltimore, Syracuse, St. Paul and San Francisco, with the field trial winnings at the Pacific coast of Beautiful Queen (a Ranger ex Queen) second in free for all, his grand progeny a first and second there too, stamp Ranger one of the most successful stud pointers of America. The breeding and selection of this blood (the "Ranger dogs") has been especially for

field work, and they have filled the bill for shooting, during the hottest of weather and in all its variety, on the game birds of the Northwest and other latitudes where they are owned. My experience with them has not been limited. Season after season the many years past, in the best of company, they have held their own, and when all good quality coupled with endurance were the test, they have not been found wanting, but always in the lead. And for that finer (?) quality, their bench show record speaks for itself, being judged by English as well as the many American judges competent to render an opinion. *Si monumentum quæries circumspice.*

S. B. DILLEY.

ROSENDALE, Wis., March 17.

ENGLISH KENNEL NOTES.

IT will be my endeavor in these fortnightly notes to keep my readers *au courant* with all that is going on in the English kennel world.

In order to start fair I think it will be advisable to commence with a retrospect. The year 1883, which seems to have come to an end so little time ago that I have not yet got into the habit of writing 1884, was the biggest show year we have had, and the owners of large exhibition kennels must positively dread the approach of the 1884 show season.

Apart from the usual shows, those at the Palace and Birmingham, the greatest successes of 1883 were scored by Warwick, York and Sheffield. The first named rejoiced in the patronage of a Prince, and that in the land that gave birth to the author of "The Book of Snobs" means gate money.

Warwick, from its midland position, was sure to draw a big entry, and then, besides the presence of our "fiddling" Prince, they were clever enough to secure the catch-penny attraction of Lady Florence Dixie's heroic St. Bernard, who from his bench held quite a levée, and received with conscious dignity the homage of the credulous.

Encouraged by success the Warwick committee have this year erected their own building and issued the most liberal schedule that I have yet seen. Even Japanese and truffle dogs have separate classes. Where the truffle dog entries are to come from, *gourmets* only know. Added to its other advantages, Warwick is first in the field, and I am confident that their liberality and enterprise will be rewarded with a bumper entry. The collie classes are sure to be a leading feature.

I notice that the York committee have been patting their secretary and one another on the back. It is always pleasant to be able to shake hands with one's self. They may repeat their venture, though they will lack the auxiliary aid of the royal show and the royal presence.

Last year H. R. H. the Prince of Wales, and one of the "six hundred" heroes, Sir "Garge" Wombwell, walked through the benches, and I don't think the committee have recovered their breath yet.

Sheffield was a good show and cleverly timed; it just cut in for the York entries; I fear it would not do so well if renewed on independent lines.

How shows may fall off was manifested in a marked manner by Hertford last year. The year before it was covered with compliments, last year they were unfortunate in the choice of their officials, and dire offense was given to exhibitors, at least so I gather from the kennel press, in which I read that their committee were brought before the Kennel Club.

The great trouble with most local shows is that the local personages, the tinker, tailor, and candlestick maker, are all anxious to do their little "strut," and the result is they overact their parts, and give offense to those whose lives and tastes are not cast in provincial places. Hertford has wisely decided not to solicit the support of the "doggy" world this year.

Birmingham made a plucky stand against the increasing arrogance of the Kennel Club, and on the point of entries got beaten from over-confidence. We owe a very great deal to the Kennel Club, many reforms, many beneficial innovations, and I shall always be ready to concede my praise when it is becomingly deserved.

Birmingham was so hard hit this year, and a little below the belt, if the truth be admitted, that I am prepared to take the shortest odds, she will next year set her house in order and be ready to receive her many supporters whose hearts are true to Brum.

So much for the show-world. Now for the positions of the breeds. The demand for good sporting dogs continues, and particularly from abroad. Germany does not buy so many as she used to. Prince Solms's magnificent kennel, at Brauenfels, seems equal to supplying the home wants.

France is England's best continental client, *la vieille noblesse* are still ready to pay their francs in thousands for Gordon setters and Laveracks, though the first named are first favorites. The fancy has just struck them for black spaniels, but they have got on the wrong track somehow, and require black and tan *"spaniels de la race cocker."*

Among the *gommeux*, the all too pschutt who affect buggies, *le high life* and *le sport*, the *bool dogue à l'Anglaise* is the *ne plus ultra* of Parisian dudery.

Fox-terriers continue to add to their numbers, and it is a curious fact that the more common a breed becomes the more money is a really good specimen worth. After all, this admits of a very simple explanation, as the more bitches there are the more money will a decent stud dog earn.

Fox-terrier men must feel bad over the disclosures in the Briggs case. There must lurk a moral somewhere around, when a dog that is purchased from a coal miner for five shillings, and makes a sensation in the fancy, becomes invincible, and is claimed by a noble lord for £200.

Of course a pedigree was hatched. How true it is, indeed, of dogs as of men, that the pedigree is worth more than the dog.

But what a satire it is upon all our scientific breeding directions that this gutter pup should beat our best. The Caucasian is played out. Shut up the brood kennels. Where is the use of breeding champions when with a bit of liver and some anise seed we can go out into the highways and "catch 'em?"

You still continue to absorb our black spaniels, but we will meet the demand. "Where the voice of the dollar calls, etc." If you should weary of your present hobby try Clumbers.

The Duke of Portland showed a beautiful team of those handsome dogs at the Palace. Added to the beauty of the head and the silvery glint of the white hair set off by the lemon markings, there is an indescribable atmosphere in their coats that has been realistically reproduced on canvass by one artist only, Hayward Handy.

This breed was for generations jealously guarded by the Newcastle family, and a tale is told that illustrates the pride they took in keeping this breed to themselves.

The Duke had a house party and, after luncheon, strolled with his guests to see the eyry. On arriving there a groom met him with a basket containing a litter of Clumber puppies, with which his Grace, in a naturally nonchalant manner, began to feed the eaglets. As he was passing the third puppy through the bars one of his guests begged its life and said how pleased he should be to rear it. "Which of my estates would you like?" asked the Duke, smilingly.

Even the large sums that prize dogs are continually changing hands for have not prepared one for the amazement I felt on reading that the American actor Emmet had given £850 for the St. Bernard Rector.

As I presume, he has bought for private enjoyment, that must be considered an exceptional as well as a fancy price. It could only be termed a fair price if breeders in the States are prepared to pay twenty guineas stud fee for him.

Rector's career has been a curious one. I first saw him as an enormous puppy at the Kennel Club Show. I observed that he was all height and bad temper. He tasted one or two people.

He was claimed by Colman, the mustard man, who, favored by fortune and blasé palates, needs must seek the highest. Mr. Colman was already famous for his luscious large grapes, the *Gros Colman*, he had won the Queen's prize with his beautiful heifer, at the Agricultural Hall, and now he purchased for £100 the biggest dog in the world.

He soon returned to the possession of his vendor, Mr. Gould, who, it may be presumed, got him back for much less than he sold him. It is said that the first time Mr. Colman wished to show Rector to his friends, he "went for" them, chased the gardeners out of the grounds, followed his owner and friends into the house, and that they had to save themselves by dropping out of the windows.

Rector next appears hawked about the streets of London for sale—a perfect wreck. He was paraded in the busy haunts of the city and on the railway platforms; £60 they would take for him, but the public don't give £60 for a dog, and the fancy "knew" him.

At last Little Smith, of Leeds (as he is called to distinguish him from Big Smith, of Sheffield), had the audacious courage to buy him. Some months after I remember standing at the entrance wicket of the Sheffield show talking to a well-known St. Bernard man; we were criticising the arrivals. "Hullo," cried my friend, and looking round I saw the object of his surprise. Little Smith leading a magnificent dog. "Who is it?" we both asked. "Rector," replied the smaller end of the chain, beaming behind his spectacles. We were thunderstruck. Rector was fat, his coat had a bright gloss, and he appeared as meek as a lamb.

"How did you manage it?" gasped my friend. "Oh, I cured his temper by punching him, and got him into condition on bread and gravy."

There you are, St. Bernard men, I put you into possession of the secret of success. St. Bernards are notoriously a mangy breed, but the bread and gravy diet can't be beating, and I imagine Mr. Smith forgot to mention arsenic as an important part of the treatment.

With regard to fist versus stick, I had long made the same discovery. It is always an awkward affair to tackle a big dog. If you hit him loose he runs off with a growl, if you take him by the collar and hide him you must be physically capable of the performance; but roll a coat around your right arm and let him have a few from your left, and let your blows fall just above his nose, the novelty of the attack and the sharp pain will cow the largest dog so long as you keep your own nerve.

Since deciding upon a signature for these notes, I have heard that one of the handsomest entries for this year's Derby is my namesake. I suppose it was the Englishman's innate betting instinct that set me off at once to back the coincidence at the modest price of 50-1, and now I can assure his noble owner that nobody would more sincerely rejoice in his victory than

LILLIBULLERO.

LONDON, Eng., March 11.

A NEW AMERICAN KENNEL CLUB.

Editor Forest and Stream:

A letter which appeared in the March issue of the *American Kennel Register* from Mr. Van Schaick, touching the desirability of inaugurating an American Kennel Club, appear to me to be worthy of consideration. I expect I will be drawing down on myself the indignation of the N. A. K. C. for advocating such a move, nevertheless, I do so, and I think I will be supported by a very large number of the breeders of dogs on this continent.

Pointers and setters are not the only class of dogs that need encouragement and protection. Take the catalogue of the New York Bench Show, of 1882; out of 1041 entries there were 508 entries of dogs other than pointers and setters, which shows that even two years ago there were more than one-half of the entries belonging to other breeds of dogs.

The N.A.K.C. have, for the last four or five years, devoted their entire energies and resources to the development of field trials, certainly a most laudable object, but at the same time they have lost sight of one of the first objects for which it was formed, the issuing of a Kennel Register and the furthering of bench shows.

The *American Kennel Register* is doing a good work, and richly deserves the thanks and support of all breeders, but at the same time it is a private undertaking, and consequently it cannot deal with many matters which are of vital interest to dog owners as a whole.

We want a kennel club which shall take up the interest of all breeds of dogs, which will interest itself in the development of dogs, bench shows, collie trials, retrieving trials, coursing, and be a guide to the proper registering of pedigrees, and to see that no frauds are perpetrated on the public, so far as it is in its power to prevent. This club can be established without in any way interfering with the interests of the N.A.K.C., as it need not interfere with the arrangements of field trials for pointers and setters, and I think it ought to have the hearty support of the members of that club.

When the N. A. K. C. was formed, pointers and setters were the most valuable dogs, and the owners of them, the ones who took the most interest in canine affairs. Since then a very great change has taken place in this country among the breeders, owners and fanciers of dogs, which anyone who may attend any of the large bench shows of to-day may see, and if I dare make an estimate of the value of the non-sporting dogs which may be exhibited at the next New York show, I think it would equal the value of the sporting division, and perhaps go much beyond. I would suggest through your widely circulated journal the advisability of having a meeting of owners and breeders at the coming bench show at New York in May next, when steps could be taken for the formation of an American Kennel Club, if such an organization was considered necessary. In the meantime, would it not be beneficial if the numerous fanciers would give their ideas on the subject through the medium of FOREST AND STREAM? J. S. NIVEN.

LONDON, Ont., March 21.

NON-SPORTING DOG SHOW.

Editor Forest and Stream:

At an informal meeting of a few gentlemen, owners and breeders of non-sporting dogs, held last Thursday, the following preamble and resolution was offered by a gentleman present, well-known as an enthusiast on doggy matters:

Whereas, Heretofore the bench shows throughout the country have been given by kennel clubs, whose object is the breeding and perfecting of the various sporting dogs, and

Whereas, In furtherance of that object, the classes and prizes for sporting dogs have been made a feature to the detriment of the non-sporting classes, and,

Whereas, By such encouragement their object has been attained, and the American field dogs stand second to none;

Resolved, That a determined and well organized effort be made, and the assistance of all owners, breeders and admirers of non-sporting dogs be invited to co-operate in bringing about a show in October next, in the city of New York, for non-sporting dogs only.

All persons desiring to respond to the above invitation may do so by addressing, THE CLOVERNOOK KENNEL.

185 FIFTH AVENUE, New York City.

CONDITION FOR BENCH SHOWS.—Mr. Lacy, whose announcement will be found in our advertising department, is represented to us by those in whom we have confidence, to be thoroughly competent to take charge of dogs and put them in condition for show purposes. This will answer the many inquiries that we have received in relation to the matter and we have no doubt that he will have as many animals as he can attend to.

ST. LOUIS DOG SHOW.

Editor Forest and Stream:

The dog show prospects are very flattering. More entries are already in than was expected at this time. One hundred dollars has been donated by a gentleman here to be given in specials for Canadian dogs. We hope this will induce a good number of entries from Canada. Special rates have been secured on all the railroads and express companies entering St. Louis. The special prizes, from present indications, will reach fully $2,000. The *Globe-Democrat* donates $150 for a special premium, but it has not been assigned to a class yet, nor has it been decided what will be purchased with the money. But very probably it will go for a solid silver and gold collar. Mermod Jaccard Jewelry Company donate a $75 prize in silverware. The collie classes will have a number of special prizes worth coming a long way to win. None of the dogs will be forgotten. A thousand prize lists have been sent out already, and inquiries are coming in daily. Carpenters begin work at the show building next week. The office of the dog show is at 313 North Third street. J. W. MUNSON.

ST. LOUIS, March 29.

THE NEW YORK DOG SHOW.

THE entries for the eighth annual bench show of the Westminster Kennel Club are coming in rapidly, and the indications are that the show will be the most brilliant that the club has yet held. In addition to the liberal prize list there have already been offered a large number of valuable specials, and many more are promised. We have received the list of them to date, but too late for this issue. They will appear next week. Any one wishing to offer a special prize is requested to do so before April 12, in order that it may appear in the catalogue. The list of judges is now complete, and the club may congratulate themselves upon securing the services of gentlemen so well and favorably known. Following is the list:

Mastiffs, Newfoundlands and pugs, Mr. Paul Dana, New York.

St. Bernards, berghunde, spaniels, beagles, basset hounds, dachshunde, fox-terriers, collies, bulldogs, bull-terriers, and all other terrier classes, Mr. James Mortimer, New York.

Greyhounds, deerhounds and Italian greyhounds, Mr. Jos. R. Pierson, Buckingham, Pa.

Pointers, Mr. E. C. Sterling, St. Louis, Mo.

English setters, Mr. John C. Higgins, Delaware City, Del.

Black and tan setters, Irish setters and foxhounds, Hon. John S. Wise, Richmond, Va.

Chesapeake Bay dogs, Mr. Isaac Townsend, New York.

Caniche poodles, Mr. John G. Heckscher, New York.

TORONTO DOG SHOW.

THE second annual show given under the auspices of the Dominion of Canada Kennel Club was held in Toronto on March 26 and two following days, and proved to be a great success, as well in the number and quality of the entries as financially. The building selected for the exhibiton was the Concert Hall in the Horticultural Gardens, one admirably adapted for the purpose, owing to the excellent light and ventilation. It proved to be rather too small, however, for the number of dogs, and some of these were necessarily benched in a dark passage way. It had been arranged that Mr. Lincoln should come on and superintend the show, but he failed the committee at the last moment, and they had to trust to their own resources. Mr. Jas. Spooner took Mr. Lincoln's place and left little to be desired after the dogs were benched. Mr. W.S. Jackson, the secretary, and Messrs. Cassells, Boyle, Malloch, Postlethwaite, Tinning, Kirk and others lent valuable assistance, and the only thing really to find fault with was the acceptance of late entries after the catalogue had been made up. This caused trouble in the judging ring now and again to find out what certain animals were that came in minus number or any clew to their identity, and in the case of Mr. Lindsay's collies, the man who brought them on knew nothing about them and the owner suffered in consequence. The committee of the Kennel Club can now see that there is no need to accept late entries, to make a show a financial success, and should be governed accordingly in future.

Rain fell heavily on the first day, but cleared off before night, and from then until the close on Friday night the weather and the attendance were excellent. On Thursday nearly 5,000 paying visitors passed through the gates, and when we left on Friday afternoon it looked as if there would be as many present again ere the show came to a close at 10 o'clock. The judges announced to officiate were Messrs. J. M. Taylor, William Hendrie and James Watson, but the former had to ask the committee to relieve him, and Mr. John Davidson, of Monroe, was asked to fill the vacancy, and at once accepted. It was a pleasure to see him again in the ring, and the many expressions of satisfaction from the exhibitors indicates that his popularity as a judge has not diminished. His classes were all setters and pointers; Mr. Hendrie covered foxhounds, harriers, deerhounds, greyhounds, bull-terriers, Skye terriers and Dandie Dinmonts, and Mr. Watson went through the remainder of the long catalogue. To Toronto belongs the credit of bringing together the largest display of field and cocker spaniels ever seen in this country, the prize list having provided liberally for the breed, ten classes being on the catalogue. The following summary of the entries will be of interest:

Setters	75	Newfoundlands	13
Pointers	23	Collies	40
Spaniels	75	Bulldogs	4
Hounds	50	Terriers and Toys	80
Fox-terriers	42	Miscellaneous and foreign	25
Mastiffs	15		
St. Bernards	10		

ENGLISH SETTERS.

In champions, Lava Rock was an absentee, as usual, and Dick Laverack scored first blood for Mr. Davey over London and Mingo. Dick's kennel companion, Liddersdale, failed, however, to defeat Lady May, a wonderfully smart bitch, for the championship honors of her sex. Nellie May, also very good, was the third entry in this class. In the open dog class, Cambridge got the blue. He is a fine, upstanding dog, with rare working development, but he lacks quality in head and was not in good coat. Hughes's Paris III. is heavy in head, but was well shown. Kink, a brother to Mingo, we liked very well, and Dashing Storm got the reserve, which seems to be his lot. He is a taking dog, and has yet time to improve and fill out. Cambridge II. has a plain head, and might be better on his forelegs and have greater depth of chest. Prince Phœbus was shown in excellent condition. Grouse wants more character in head, but has good body and legs. The bitches were, in the opinion of the judge, a very fine class, and he picked out a good one in Belle for first. She has a good deal more substance than Genevieve, who is rather light, but looks like traveling. Forest Dora takes after her sire in type. Abbie we did not think much of, as she lacks quality, and next to the winner, or very close up to her, we should have placed Lucy Bee, a nicely marked black, tan and white, particularly good in head. The puppies were very moderate.

IRISH SETTERS.

Chief, shown in superb condition, was alone in champion dogs. We have never seen him looking better. There were no champion bitches. Chief II. was an easy first in open dogs, and after mentioning Belle as an equally safe first in her class, the others may be dismissed as of moderate pretensions, sadly deficient in the style and finish seen in the best setters seen at shows this side of the line, and on which the Elcho stamp of fashion is set.

BLACK AND TAN SETTERS.

In the Gordon or black and tan class the exhibits were mod-

superior to the Irish. Argus was the only one in the champion class. Pride of Canada, good in color and head, and well shown, was well ahead of Brant. Major is a strong, upstanding dog, but his coat lacked lustre. Grouse is weak in head for a Gordon. In the bitch class, Lottie was superior to June in condition, both being very good in color. Jason is a promising puppy and a credit to his sire, Argus.

POINTERS.

King Bow was in anything but good shape, and was removed from his bench, leaving Knickerbocker and Dick to contend for the championship. The former very properly received the award, Meteor, entered by Col. W. E. Hughes, was decidedly the best in the open class. He wants squareness in muzzle, and we thought he might be improved in body. His legs and feet are of the best. Ranger we liked very much, and it was a close thing between him and Bang for second place. Duffer, unnoticed, is aptly named, and Rex, though plain in head, is otherwise a very fair specimen. Shot was not on his bench when our notes were taken. The bitches were decidedly inferior to the dogs, and we were not very much impressed with Mr. Munson's brace, though they rightly enough took first and second prizes. Snipe was the best of the puppies.

SPANIELS.

In Irish water spaniels, Driver was better in head and size than Rocky, and third prize might have been withheld. Jack was a very poor Clumber, and although the only one shown, all he was entitled to is third prize. Benedict had not arrived when champion field spaniels were judged, and first went to Bob, Jr., over Toronto Beau, who is not right in coat. First was withheld in the large size class for other than black or liver, and second was given a strong, leggy dog of the type generally styled Norfolk. Black Mack is short and thick in head but of good length, has a flat coat, and was well shown. King Beau is too high on the leg, and his coat was rather faded. Beau is so bad on his forelegs that he can never get high on the prize list. Burdette Bob is very bad in coat, and the scarred condition of his face suggested the dog pit more than the field as his strong suit. In the black and liver bitches, Flora, a black and tan, was in the wrong class, and Midnight was underweight, so that Maggie had a walk over. She is good in coat and feather, but her head wants length. Bene, though she has not fulfilled the promise of her youthful days, is much more of a cocker than Brahmin, whose proper place is among the field spaniels. He was well shown, a remark that applies to all the exhibits from the Woodland Kennels. Raven was overweight, and was therefore put out of the small black class. Hornell Silk took first. He wants more character in head, but is otherwise a good dog, having straight legs, good body and flat coat. Hornell Sam has a short, wedgy head, and is light of bone. His best point is length of body and straight coat. Young Obo has a dome skull and wedgy muzzle, but is otherwise a most promising youngster, standing on short, straight legs, and his coat is of the best. Jack is full in the eye, and has rather too much white on his breast and feet for a black spaniel. Dick and Garnet, two of the unnoticed division, looked more like stunted Gordon setters, and were in the wrong class anyway on account of their color. Woodstock, the winning black cocker, was heavy with whelp, but for all that had no trouble in getting the place. Hornell 101 is poor in head and light-boned, but has good length and coat. Nelly, like a good many of Rollo's progeny, has a faint showing of tan through the black which does not improve her appearance. Woodstock Flirt is too high on the leg, and her coat is inclined to curl. She has time to improve, and if she grows on will be better in the large class. Cocker dogs, any other color, were a mixed lot. Sport, a black and white, is deficient in character. Speed was not well shown, and there was little to choose between these. With the exception of Hornell Rattler, the other entries were half bred water spaniels. Rattler we did not like; his head is coarse, and is not improved by his bloodhound eye; legs good, with plenty of bone, and he is also fairly well in length of body, but he fails to impress one with the idea of his being a spaniel. Bitches, other than black, brought Daisy, the Montreal winner, to the front. She has not improved since then, and besides being a trifle leggy for the present style, is deficient in coat and feather for a bitch of her age. Woodstock Nellie is a promising youngster, and if she does not get too large, will prove troublesome in this class in future. Luna is coarse in head and has a terrier body. Busy is too full in the eye, and they are placed too wide apart, which makes her appear monkey-faced. Her coat is none of the best, but she is a fair specimen of a cocker. The leaders of the puppy class have already been referred to in connection with the open classes.

FOXHOUNDS.

This was the first class Mr. Hendrie had to handle, and it is a pity he did not feel more at home in the ring, for he had a difficult lot to deal with; indeed, an old stager would have had to put on his considering cap before arriving at a conclusion. The handlers crowded in so that it was really impossible to get a good look at the dogs, but from what we saw of them we preferred Macklem's Sam and O'Shea's Forester II. Both were passed over, and first went to Tanner, good in front but weak behind. Ringwood has very open feet, and Clarebank does not stand on his hind legs as a good hound should. Driver getting a vhc. was certainly a mistake, as he could not compare in any way with the same owner's Sam. The two puppies shown were only three months old, and an opinion upon their merits is hardly necessary.

HARRIERS AND BEAGLES.

There was much diversity of type in harriers, and Mr. Hendrie picked out the best shaped ones. Rattler again beat Music in beagles, and Dell did not show so well as we have seen him; the journey from New York having left him in poor shape.

DEERHOUNDS.

Lance, now well known, headed the list, and next to him came a grand puppy shown by Mr. Dundas. Both Wyvis and Lorna II. lacked coat.

GREYHOUNDS.

The sexes were divided in the champion class, so Friday Night and Dorothee had each a walk over. In the open class we preferred the unnoticed Robert the Devil to any of the others, and there seemed to be some mistake in withholding second while three dogs were very highly commended.

FOX-TERRIERS.

Fennel had no opposition for his championship, and both Jaunty and Tip were wrongly entered in the champion bitch class in which Thistle beat Lyra. There were some extra good ones in the open classes. Mixture has the best legs and feet we ever saw on a terrier, and looks all over a workman. Vakeel is out at elbows, and his feet are open; in these points Belvoir Jim beats him, but the former is the more taking dog of the two. Brokenhurst Bob is coarse in head, but is a good terrier nevertheless. Richmond Olive was not to be denied in the bitch class; this is a grand bitch, but we would like her better if she had more bone. It was very hard on Village Belle meeting such an opponent, for in ordinary company she is a sure winner. Nellie is also a very good one, indeed it was a grand class so far as the noticed division were concerned. The puppies were not much to boast of.

MASTIFFS.

Although entered without pedigree, Nelson shows good breeding and deserves his place. Agrippa's size will always be against him, but his points are bound to secure recognition. Jumbo had something the matter with one of his eyes, but in selecting him, Mr. Watson stuck to the type of those placed ahead of him. Lion is a good little dog, but lacks character, and Duchess is weak in head.

ST. BERNARDS.

Lady Abbess being withdrawn, left Priam to walk over for the championship. Hermit beat Noble in the open class in head and size, but they are neither of them first-class. The others were an odd lot of berghunde.

NEWFOUNDLANDS.

This was one of the strongest classes in the show, and ten out of the thirteen led into the ring received cards. First was given to Mr. Kirk's Jim, a fair-sized dog with a grand head and coat, and shown in perfect condition. Leo is larger than Jim, but does not show his quality, nor had as much attention been paid to his appearance. Third went to Juno, a bitch of great substance and heavy in whelp to Carlo, also a good dog, though showing his age a little. Bruce is a youngster that promises to make a fine dog, and the others that received commendations were deserving of their honors.

COLLIES.

Quality was sadly lacking in the collie classes, there being a lot of indifferent specimens shown. Rex beat Lorne for the champion honors, Chieftain being put out on the score of lameness. The winner was looking well, but carried a gay flag in the ring. Herdman's Laddie, though coarse in ear, is a taking dog, and was decidedly the best in the open dog class. Sly is plain in face, heavy-eared, and Rough and Help are faulty in the same way. Miss Timmins was by long odds the most typical collie shown, having perfect ears, well carried, and the right kind for head, but she had no upper coat, and could not obtain the place and honors she would otherwise have been entitled to. Fairy, the winning bitch, is good in shape and coat, but lacks character in head, and her ears are not right. Lassie is one of the plain, sensible-looking sort, and her owner said she was the best for use he had ever seen. Miss Timmins won in the puppy class, and of the two very highly commended, Leila promises to grow on into the better dog if he is not undersized.

BULLDOGS AND BULL-TERRIERS.

Bellisima, shown for the first time in this country, was placed in front of Tippoo and Romulus. She is a grand bitch, but her maternal duties had pulled her down very much, and it will take all the time between now and New York to get her in proper shape. Young Bill was the only good bull-terrier shown. Spring is a weedy fellow, and Billy showed too much of the bulldog about the head and chest.

TERRIERS.

The best classes in terriers were the Bedlingtons, which have been taken to by the Toronto fanciers. In the dog class Flint won by condition, though it is our opinion that Blucher, shown right, is the best of the lot, but he was put back to third, behind Mr. Scholes's other dog, Jerry. Both in the dog and bitch classes there were some nice puppies out of Tynesider II., but the dam had not got sufficient coat on her to dispose of Stonehouse Lass. The Torontonians will learn before long that they have taken to one of the most difficult breeds to show right, and that to win they must devote the greatest attention to the condition of their dogs. There were several nice Skyes shown and one good Dandie, but Mr. Hendrie did not consider him entitled to a prize. Norah was placed over the weedy Erin in Irish terriers, and Teaser, of course, won in black and tans. Montreal fanciers carried off the honors in Yorkshires, the best of the lot being little Fritz, who, as usual, was short of coat. The pugs and toys were poor, but there was a grand-headed King Charles to the front in the spaniel class. We take a great fancy to the black Thibetian sheep dog with his black tongue and mouth, and he was given first in the foreign class, and there was also a good large-size Russian poodle in the miscellaneous class. Following are the

AWARDS.

Class 1. Champion English Setters, Dogs.—1st, T. G. Davey's Dick Laverack, blue belton, 4½yrs., Thunder—Peeress.

Class 2. Champion English Setters, Bitches.—1st, Henry Pape's Lady May, blue belton.

Class 3. English Setters, Dogs.—1st, Montague Smith's Cambridge, blue belton, 4yrs., Gladstone—Clip; 2d, F. G. Hughes's Paris III, white, black and ticked, 2yrs., Paris II.—Lady Princess; 3d, Wm. B. Wells's Kink, lemon and white, 6yrs., Druid—Star. Very high com. and reserve, R. W. Boyle's Dashing Storm, white, black and ticked, 15mos., Royal Sultan—Reign; T. G. Davey's Prince Phœbus, black and white, 4yrs., Tam o' Shanter—Prue; A. Wyness, Jr.'s Cambridge II., black, white and tan, 14mos., Cambridge I.—Smith's Belle. High com., Thomas Hutchinson's Paris III., black, white and tan, 2yrs., Paris Belle; H. H. Curtis's Grouse. Com., Fred A. Sullivan's Doctor, liver and white, 7yrs., Billy—Bell, and Colonel, liver and white, 4yrs., Doctor—Nellie.

Class 4. English Setters, Bitches.—1st and very high com. reserve, Montague Smith's Belle, blue belton, 3yrs., Dime—Princess Blanche, and Abbie, blue belton, 4yrs., Gladstone—Mersey; 2d, T. G. Davey's Genevieve, blue belton, 22mos., London—Dawn; 3d, C. A. Stone's Forest Dora, A.K.R. 500. Very high com., Jos. Kime's Lucy Bee, black, white and tan, 2yrs., Paris II.—Romp. High com., T. G. Davey's Canadian Queen, black, white and tan, 17mos, Lava Rock—Liddersdale; D. O'Shea's Lilly, lemon and white, 2yrs., Dick Laverack—Louie.

Class 5. English Setter Puppies, Dogs.—1st, C. A. Stone's Forest Blue, blue belton, 10mos., Prince Royal—Forest Fly; 2d, J. F. Kirk's Royal, liver and white, 8mos., Royal Sultan—Woodstock Belle. Third prize withheld.

Class 26. Black or Liver Field Spaniels, Bitches.—1st, Hornel Spaniel Club's Maggie, black, 2yrs., Bob III —Fannie.

Class 27. Champion Cocker Spaniels (any color).—1st, J. S. Niven's Bene, black, 2½yrs., Bob III.—Black Bess.

Class 28. Black Cocker Spaniels, Dogs.—1st and 2d, Hornell Spaniel Club's Hornell Silk, black, 19mos., champion Obo—Chloe II., and Hornell Sam, black, 18mos., Bonanza—Pansy; 3d, Andrew Laidlaw's Young Obo, A.K.R. 861. High com., Geo. P. Reid's Jack, black 18mos., pedigree unknown.

Class 29. Black Cocker Spaniels, Bitches.—1st, James Luckwell's Woodstock Queen, black, 1yr. 8mos., Bean—Black Bess; 2d, Hornell Spaniel Club's Hornell 101, black, 16mos., Benedict—Prin; 3d, Cleveland V. Hall's Nelly, black, 3yrs., Rollo—Roxie. High com., Andrew Laidlaw's Woodstock Flirt, A.K.R. 651; David Durward's Oxie, black 17mos., Kellie's imported dog—Laidlaw's Beauty. Com., F. A. Campbell's Dido, black, 3yrs., Rollo—Bessy.

Class 30. Cocker Spaniel's Other than Black. Dogs.—1st, F. E. Curtis's Sport, black and white, 13mos., Jet—Daisy; 2d, Geo. McBride's Speed, liver, 16mos., Kellie's Tippoo—Laidlaw's Beauty; 3d, withheld. High com., Hornell Spaniel Club's Hornell Rattler, chestnut and tan, 11mos., Hornell Dandy—Dinah.

Class 31 Cocker Spaniels Other than Black. Bitches. 1st, Geo. Payne's Daisy, liver and white, 4yrs.; 2d, J. W. Kelly's Woodstock Nellie, liver, 7mos., Toronto Beau—Toronto Jet. High com., Geo. Schofield's Luna, black and white, 3yrs., Jack—Jessie; Wm. Farrar's Busy, liver and tan, 5yrs., Dash—Daisy.

Class 32. Field and Cocker Spaniels, Puppies.—1st, Andrew Laidlaw's Midnight, A.K.R. 656. Very high com., John W. Kelly's Woodstock Nellie, liver, 7mos., Toronto Beau—Toronto Jet; Andrew Laidlaw's Young Obo, A.K.R. 861. High com., E. A. M. Gibson's Ruby, liver, 9mos., Macbeth's Doctor—Niven's Dollie; R. Tinning's Strathaven, black, 4mos., Kirk's Beau—Creole; Dan O'Shea's Rosey, black, 9mos., Doctor—Niven's Dolly; Hornell Spaniel Club's Hornell Rattler, chestnut and tan, 11mos., Hornell Dandy—Dinah. Com., J. Scanlan's Arthur, black and white, 4mos., Jet—Floss; J. McKay's Flirt, liver and white, 6mos., Sam—Ruby.

Class 33. Foxhounds.—1st, John Hammon's Tanner, black, white and tan, 3yrs., Dan—Beauty; 2d, D. O'Shea's Ringwood, black, white and tan, 3yrs., Forrester—Lady; 3d, John Halligan's Clarebank, white and black, 3yrs., Vampire—Captious. Very high com., A. V. Macklem's Driver, white and black, 4yrs., pedigree unknown.

Class 34. Foxhounds. Puppies.—1st, D. O'Shea's Ringwood II., white, black and tan, 3mos., Ringwood—Gyp.

Class 35. Harriers.—1st, Alex. Stiver's Leader, spotted, 8yrs; 2d, D. O'Shea's Frank, white, black and tan, 2yrs., Tomboy—Gypsey. High com., Wm. H. Hall's Ranter, black, tan and white, 3yrs., Ranter—Gypsey.

Class 36. Beagles.—1st and 2d, D. O'Shea's Rattler, white, black and tan, 2yrs., Rover—Music, and Music, white, black and tan, 2yrs., Rover—Music; 3d, W. E. Livingstone's Dell, A.K.R. 319. Com., A. Harris's Lu, black, white and tan, 11mos., Flute—Ringwood Lucy.

Class 37. Beagles, Puppies.—1st, A. Harris's No Name, black, white and tan, 8mos., Flute—Queen. Very high com., D. O'Shea's Kino, white, black and tan, 10mos., Rattler—Vixen.

Class 38. Deerhounds.—1st and very high com., Jno. E. Thayer's Lance, fawn, 4yrs., and Lorna II., brindle, 3yrs., Bruce—Lorna; 2d and very high com., Thos. G. Dundas's Bran, light brindle, 7mos., champion Bruce—Wyvis, and Wyvis, brindle, 4yrs., Torrum—Lufra.

Class 39. Champion Greyhounds, Dogs.—1st, H. W. Smith's Friday Night, A.K.R. 753.

Class 39A. Champion Greyhounds, Bitches.—H. W. Huntington's Dorothée, A.K.R. 72.

Class 40. Greyhounds.—1st, H. Howard's Misterton, fawn, 16mos., Erin—Fly; 2d, not awarded. Very high com., W. H. Hall's Neptune, fawn, 2yrs., Ringwood—Jessie; M. J. Graham's Ringwood, fawn, 6yrs., Ringwood—Nellie; Alexander Ford's Arabi Bey, fawn, 12mos., Pilot—Speed.

Class 41. Champion Fox-Terriers, Dogs.—1st, Richard Gibson's Fennel, white and tan, 2yrs., champion Spice—champion Bloom.

Class 42. Champion Fox-Terriers, Bitches.—1st, Richard Gibson's Thistle, black and white, 3yrs., champion Rattler II.—champion Tipsey.

Class 43. Fox-Terriers, Dogs.—1st, John E. Thayer's Mixture, black, tan and white, 4yrs., by champion Spice; equal 2d, John T. Cabel's Vakeel, E.K.C.S.B. 12,352, white, black and tan, 2½yrs., champion Volo—champion Spiteful, and Richard Gibson's Belvoir Jim, white, black and tan, 1yr., Spigot—Lily. Very high com., A. Z. Palmer's Brockenhurst Bob, E.K.C.S.B. 8,901, white, black and tan head, 5yrs., Brockenhurst Joe—Gamesome. High com., Goodwin Gibson's Bowler, A.K.R. 666. Com., W. M. Mills's Punch, white, black and tan, 2yrs., Rattler—Daisy; J. Massey's Chico, white, black and tan.

Class 44. Fox-Terriers, Bitches.—1st, J. E. Thayer's Richmond Olive, white, black and tan, 2½yrs., Olive Tart—Jess; 2d, Jno. T. Cable's Village Belle, white, black and tan, 2yrs. 9mos., champion Volo—champion Beauty; 3d, D. Booth's Nellie, white and black, 3yrs., Trap—Nettle. Very high com., G. May's Nellie, black and white, 2yrs., pedigree not stated; John T. Cable's Busy, A.K.R. 435. High com., A. Z. Palmer's Ruby, white, black and tan, Brockenhurst Bob—Ruby. Com., Arthur Boulton's Mab, white, Gibson's Patch—Patteson's Stiug.

Class 45. Fox-Terriers, Puppies.—1st, John T. Cable's Spy, white and tan, 10mos., Silver—Busy, A.K.R. 435. High com., John E. Thayer's Rascal, black, white and tan, 10mos., Naller—Diana; Richard Gibson's Rose, white, black and tan, 10mos., Fennel—Thistle; A. R. Palmer's Ruby, white, black and tan, 10mos., Brokenhurst Bob—Ruby.

Class 46. Mastiffs.—Hugh Scott's Nelson, fawn, 7yrs., pedigree not given; 2d, Shaw & Bates's Agrippa, A.K.R. 469; 3d, Wm. Mellis's Jumbo, fawn, 3½yrs, sire and dam imported by Lord Dufferin. Very high com., Jas. H. Lynch's Lion, fawn, 2½yrs., Salisbury (E. 9,335)—Tigress II. (E. 10,596). High com., Shaw & Bates's Duchess, A.K.R. 260. Com., J. Ross's Barney, fawn, 4yrs.

Class 47. Champion St. Bernards.—1st, F. W. Rothera's Priam, A.K.R. 485.

Class 48. St. Bernards, Dogs.—1st, Chequasset Kennel's Hermit, A.K.R. 23; 2d, J. F. Hanrahan's Noble, 3½yrs., Rigi—Bertha.

Class 49. St. Bernards, Bitches.—1st, withheld; 2d, W. A. Damer's St. Bernard.

Class 50. Newfoundlands.—J. F. Kirk's Jim, black, 3yrs., Bruce—Kate; 2d, W. J. L. Milligan's Leo, black, 5yrs., Simon, imported—Nell; 3d and very high com., W. D. Forbes's Juno, black, 5yrs., and Carlo, black, 11yrs. Very high com., G. W. Verral's Bruce, black, 6mos. High com., J. Harris's Victor, 8yrs.; F. W. Wilding's Oscar, black, 3yrs., Major—Fan; James Luckwell's Jack, black, 2yrs., Jim—Princess. Com., Thomas Tivey's Jacob, black, 2yrs, 1mo., Captain—Lass; Henry Brock's Carlo, black, 7yrs., pedigree unknown.

Class 51. Champion Collies.—1st, J. Lindsay's Rex, A.K.R. 149.

Class 52. Collies, Dogs.—1st, W. M. Adams's Herdman's Laddie, imported, black, tan and white, 15mos., no pedigree; 2d, Donald Mackenzie's Sly, imported, black and white, 3yrs.; 3d, E. Morris's Rough, black and tan, 1yr. High com., Thos. G. Dundas's Help, black and tan, aged, pedigree unknown. Com., J. G. Williamson's Ken, black, white and tan, 2yrs.

Class 53. Collies, Bitches.—1st, J. Lindsay's Fairy, sable and white, 9mos., Rex—Kitty Mac; 2d, T. G. Dundas's Lassie, black and tan, 18mos., pedigree unknown; 3d, Ontario Collie Club's Miss Timmins, sable and white, 10mos., Cockie—Fan. High com., L. V. Percival's Lassie, black and tan, 11mos., Bob—Luna, and Thos. Jackson's Fan, black and white, 5yrs., Welsh Collie—Fan.

Class 54. Collies, Puppies.—1st, Ontario Collie Club's Miss Timmins, sable and white, 10mos., Cockie—Fan. Very high com., Richard Gibson's Laddie, black and tan, 11mos., Bob—Luna; Fred. W. Rothera's Lella, white, black and tan, 6mos., Lorne—Lassie. High com., Arthur G. C. Bates's Jock, black and tan, 10mos., Major Lloyd's Lark—Fan II. Com., Robert McEwan's Nettie, black and tan, 9mos., Bob—Peggie.

Class 55. Bulldogs.—1st, 2d and very high com., J. E. Thayer's Bellissima, Tippoo, A.K.R. 390—Romulus, A.K.R. 389.

Class 56. Bull-Terriers.—1st, Frank C. Wheeler's Young Bill; 2d, Archie Whyte's Spring, white, 3yrs.; 3d, A. Scholes's Billy, white, 1yr., Juggler—Kitty. Very high com., Glover Harrison's Grip, brindle, 4yrs.

Class 57. Hard-haired Scotch Terriers.—1st and 2d, D. O'Shea's Boxer, red, 18mos., Major—Lady, and Lady, red, 5yrs.

Class 58. Dandie Dinmonts.—Prize withheld.

Class 59. Skye Terriers.—1st, A. T. Ogelvie's Ugie, blue, 2yrs.; 2d, J. M. Rogerson's Shagg, blue, 5yrs. Very high com., W. Dicks's Puneh, blue, 18mos., Pepper—Whiskey.

Class 60. Bedlington Terriers, Dogs.—1st, L. H. Irving's Flint, blue Newcastle Lad—Tweezers; 2d and 3d, J. F. Scholes's Jerry, liver, 3yrs., Sting—Wasp, and Blucher, liver, 2½yrs., Peachem—Batty Jess. Very high com., W. S. Jackson's Elswick Lad II., dark blue, 6mos., Elswick Lad—Tynesider II. High com., J. Massey's Sea Dog, dark blue, 6mos., Elswick Lad—Tynesider II.

DDD.—For the best toy spaniel owned by a lady, Mr. John Ross Robertson offers a prize, value $10, in cash or plate; won by Charlie, Mrs. McLean.

EEE.—For the best in the miscellaneous class, Mr. H. C. Hammond offers $10 cash. Divided between Foreigner, D. O'Shea, Hornet II., J. F. Scholes, and Sam, M. McCarron.

BEAUFORT'S CONDITION.—*Editor Forest and Stream:* In your last issue you say that Beaufort has nearly recovered from an attack of inflammation of the bowels, and that he did not, when exhibited at New Haven, carry himself in the faultless manner he affects when at his best. Though the dog has been sick, inflammation was avoided. Beaufort weighed sixty two pounds when exhibited at New Haven. I can show him at seventy-two pounds, and it was a pleasure to see him, when thus handicapped, win the special prize for the best sporting dog in the show.—CHAS. H. MASON (New York, March 24).

PEDIGREE OF LIT LAVERACK.—*Editor Forest and Stream:* In your paper of March 27, I notice that Mr. Thos. F. Connelly claims the name of Lit Laverack for a bitch puppy, and gives the pedigree as by Tempest (Pontiac ex Fairy II.) out of Lilly (Carlowitz ex Queen Bess). I saw these puppies advertised out of Lilly (Carlowitz ex Princess Nellie). Which is corret, and is Lilly a pure Laverack if her dam was Queen Bess?—G. R. NICHOLS (New Haven, March 31).

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Ravenswood Kennel. By Mr. C. B. Faxon, Boston, Mass., for his kennel of English setters.

Beauty and Black Diamond. By Mr. J. P. Willey, Salmon Falls, N. H., for black cocker spaniel bitches, whelped Feb. 13, 1884, by Obo II. (A.K.R. 432) out of Lofty (A.K.R. 431).

Emperor Frank. By Mr. Edward A. Todd, New Haven, Ct., for black and white English setter dog, whelped Nov. 28, 1883, by Tempest (Pontiac—Fairy II.) out of Lilly (Carlowitz—Princess Nellie).

Princess Lilly. By Mr. Edward A. Todd, New Haven, Ct., for black, white and tan English setter bitch, whelped Nov. 28, 1883, by Tempest (Pontiac—Fairy II.) out of Lilly (Carlowitz—Princess Nellie).

Dash IV. By Mr. D. A. Goodwin, Jr., Newburyport, Mass., for black, white and tan English setter dog, whelped Feb. 12, by Dash III. out of Matchless (Roderick II.—Jennie).

Colonel Cool. By Mr. W. B. Gates, Memphis, Tenn., for black, white and tan English setter dog, whelped June 3, 1883, by Gath (Count Noble—Peep o' Day) out of Lit (Gladstone—Juno).

Dash, Juke, Pete, Cork aad Kate. By Major Lovejoy, Bethel, Me., for red Irish setters, four dogs and one bitch, whelped March 14, by Ned Elcho (A.K.R. 984) out of Bridget O'More (A.K.R. 964).

NAMES CHANGED.

☞ *See instructions at head of this column.*

Hornell Obo to Obo, Jr. Imported black cocker spaniel dog, whelped Feb. 3, 1883 (Obo—Nellie), owned by Mr. J. P. Willey, Salmon Falls, N. H.

BRED.

☞ *See instructions at head of this column.*

Carrie J.—Paul Gladstone. Mr. W. B. Gates's (Memphis, Tenn.) English setter bitch Carrie J. (Count Noble—Peep o' Day) to his Paul Gladstone (Gladstone—Lavalette), Feb. 23.

Belle of Hatchie—Count Rapier. Dr. W. J. Cannon's (Lambert, Tenn.) English setter bitch Belle of Hatchie (Scout—Lady S.) to Mr. W. B. Gates's Count Rapier (A.K.R. 498), Feb. 25.

Daisy. Pug bitch (A.K.R. 468), owned by the Chequasset Kennels, Lancaster, Mass., March 7.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

A. D. W., Warren, Pa.—See answer to "W. H. H."

J. W. A., New Bedford, Mass.—Your dog probably has a slight attack of distemper.

W. D. B., Westfield, N. J.—Give a teaspoonful of cod liver oil three times daily for a week or two.

G. W. A., Boston, Mass.—Let the bitch pass one season and she will probably then breed all right.

ONONDAGA, Syracuse, N. Y.—Feed your dog mutton and barley broth. For the trouble in his ear see answer to "Night Hawk" last week.

C. B. M., Madison, Ga.—Wash the dog thoroughly with strong soap suds, then sop on freely sulphurous acid, one part to four of water; repeat every day for three or four days, and follow with sulphur ointment.

W. F. T., Altoona, Pa.—Your dog probably has distemper. The partial paralysis of his hindquarters is a symptom often accompanying the disease. A liveral diet and the use of tonics with careful nursing will probably bring him out all right.

W. H. H., Hartford, Conn.—1. The abscess which you describe is of very common occurrence among dogs. When forming it should be carefully watched, and as soon as a soft place can be detected, showing that pus has formed, it should be opened at its lowest or most pendant point and the pus allowed to escape naturally without squeezing. This is often one of the milder forms of distemper. 2. Distemper assumes so many forms that it is impossible for any one to intelligently prescribe without an examination. It is always safe, however, to recommend careful nursing, a warm kennel where plenty of pure air can be had, and in cases of debility, tonics may be given

Rifle and Trap Shooting.

FIXTURES.

First International Clay-Pigeon Tournament, at Chicago, Ill., May 26 to 31. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.

POWDER IGNITION.

Editor Forest and Stream:

As there seems to be great diversity of opinion as to the distance that the flash of a primer will penetrate the powder charge, I have made a few experiments to satisfy myself on the subject, and send you the results.

To show what wild statements experienced riflemen will make, I will quote the observations of two expert marksmen on the subject: One says that the flash of a Berdan No. 1 primer will permeate the entire charge to the base of the ball. The other that the force generated by the explosion of the same primer will throw a .45-caliber ball from the shell out of the muzzle of a military rifle. Both of these statements are wrong. And here I wish to make the point, that because a man has the natural gift of "holding well," he is by no means qualified to give points on scientific rifle shooting, rather the contrary, as he acquires his object without the study and painstaking required by others.

Now for my experiments: I took a quantity of sand carefully sifted to the same granulation as FG powder, and heated it thoroughly to exclude moisture and prevent cohesion. Then some .45-caliber government shells (U. M. C.), capped with Berdan No. 1 primers, were loaded as follows:

No. 1. 10 grains of sand (by measure) on top of this 10 grains FG powder, then 1 felt wad.

No. 2. 15 grains of sand; rest the same.

No. 3. 20 grains of sand; rest the same.

No. 4. 30 grains of sand; rest the same. The sand in each case was poured in lightly to avoid compression; powder the same, and the wad was lightly seated.

The results were:

No. 1. Powder ignited, and wad blown from gun.

No. 2. Powder not ignited, wad thrown about an inch beyond mouth of shell, space between grains of sand and powder filled with smoke.

No. 3. Powder not ignited, wad started but did not leave shell, smoke arose when wad was removed.

No. 4. Powder not ignited, wad not started, smoke arose from sand when poured out of shell.

10 grains of sand occupied 1/4in. in length of .45 cal. shell.
15 grains of sand occupied 3/8in. in length of .45-cal. shell.
20 grains of sand occupied 1/2in. in length of .45-cal. shell.
30 grains of sand occupied 3/4in. in length of .45-cal. shell.

Whence I think that we may reasonably infer that the flash of a Berdan No. 1 primer, penetrates the charge less than 3/4in.

Your correspondent, "J. J. P." raises some interesting points in his "Rifle Queries," in your issue of Feb. 21. I shall answer one or two of his questions when I have had time to calculate a few tables to illustrate my position, provided always, that some one does not cover the ground in the meantime. Further experiments and more accurate measurements than I had the means of making when I last wrote on the subject, incline me to the belief that Mr. Dodge is right in attributing the good performance of bullet No. 6 in my experiments to less friction. I find that the diameter of No. 6 is 0.438in. against 0.405in. for No. 4. If decreasing the diameter 14-10,000in. produces such a marked improvement, the question naturally occurs, what is the most efficient diameter? Will Mr. Dodge and our other friend who are experimentally inclined help us to a solution?

RIFLES OF TO-DAY.

THE WHITNEY RIFLE.

To tell the story of the Whitney arm in its entirety would give opportunity to rehearse the entire history of American small arm manufacture, besides leading us away into many interesting by-ways and opening up chapters of American skill in invention and production.

Eli Whitney, the elder, is probably best known as the inventor of the cotton gin, and the Whitney works started for the purpose of producing these machines, was opened in 1798. He soon turned his attention to fire-arm manufacture and was the first to recognize the importance of using hardened jigs or sample pieces of each part of an arm, so that the pieces might be interchangeable. He also applied machinery to the making of the different parts, and many features of rifle manufacture which are now regarded as standard in the different works, took their start in the Whitney Armory. While Thomas Jefferson was Secretary of State he requested Mr. Whitney to undertake the manufacture of these arms and interchangeable parts. The idea was laughed at by the English and French military men who had been accustomed to the old system, but upon the model of the old Charville flint lock. Mr. Whitney demonstrated the entire feasibility of the system demonstrated, and when the Springfield armory was established in 1800, this idea of making the corresponding part of each arm exactly alike was put in force and is now the system throughout the world. In fact the making of breechloading arms compels its use. No patents have ever been placed upon the old Whitney inventions, they remain the free property of all who care to improve upon them.

The Whitneyville Armory, near New Haven, is now one of the largest in the United States, and has a working force of over 350 men. The water power is ample, and many interesting and ingenious bits of mechanism are to be studied there. The name is still retained in the persons of the son and grandson of the original inventor, and the name of Eli Whitney is still a dominant one in the management of the works.

The system of breechloading small arm, with which we have specially to deal, had its start in the inventions made by Mr. J. Stillman, of the Springfield armory, in 1865, and by Col. T. T. S. Laidley, U. S. A., in 1866. At that time it was patented in the United States and also in foreign countries. It was the system of a breech-block pivoted below the barrel, moving upward and toward it in closing the breech. At the time of its invention the arm was put to the most severe test, not only by the United States boards of examination, but by foreign boards as well, and many favorable reports have been made upon it as an excellent arm for military service.

Col. Laidley's first models were in form very like the present Whitney rifle, and this form was subsequently adopted by the Remington Company for their arm, after the Laidley models had been made and exhibited.

There have been many modifications placed upon the original Laidley invention. It is claimed that it can be loaded and fired with a rapidity equal to that of any other single breechloader, and for continuous firing that its rapidity cannot be excelled even by any repeater or magazine arm. It has very few parts, indeed. The firing pin is withdrawn by positive motion and is not liable to remain projecting and thus reach the primer and ignite the cartridge prematurely. The ejector has a strong hold on the cartridge head, and by it the shell is withdrawn and ejected clear of the chamber. Special care is taken in the materials used and in the workmanship. It has been fired on the first trial by a person strange to the arm as often as twenty-three times per minute, and when "time" was called a cartridge was waiting in the chamber. For a severity test upward of a thousand shots were fired from a rifle without the failure or injury of a single part.

All the motions of loading and firing are performed with one hand. To load the hammer is cocked and the breech block thrown back. This withdraws the firing pin and ejects the empty cartridge shell. The new cartridge is then inserted in the chamber and with the closing of the breech block the arm is cocked ready for firing, or it may be let down to the half-cock notch and the arm is then in a condition for safe carriage by a competent rifleman.

With such large works and the facilities for turning out great quantities of arms, special effort has been made to secure contracts for military arms, and many have been filled with foreign countries. To Mexico over 20,000 of the Whitney musket and carbine have been sent. Madagascar has taken a consignment of 5,000 for the use of the native troops, while scattered about other foreign nations 50,000 of the arms may be found. It would be an interesting point to have some return reports from the several native armies, which have been supplied not only with the Whitney, but with other American rifles. As a target rifle on American ranges, the Whitney has not been pushed, and records are not as numerous as with other makes. It has done good work, however. At Marinette, Wis., Rifle Club range on May 5, 1877, James Watson made 99 in a possible 100 at 800yds., following it up with 73 in a possible 75 at 900yds., and Mr. Watson at 1,000yds., scored 59 in a possible 60; at 500yds., H. O. Fairchild led off with a close center and then put in 15 consecutive bullseyes.

The arm may be seen in its complete state in cut No. 1, which is a target rifle model. E. A. Leopold, of Norristown, has done much shooting with the Whitney arm, and very good shooting too, 49 out of a possible 50 at 200 on Nov. 1, 1878, at 100yds.; 15 consecutive shots were put into a 4-inch circle. From that time to the present all manner of matches have been shot by Mr. Leopold and with great success.

Cut No. 2 represents the arm in section showing the breech action with block down. In it the parts are numbered as follows: 1, receiver; 2, guard; 3, barrel; 4, breech block; 5, hammer; 6, breech-block pin; 7, hammer pin; 8, extractor; 9, main spring; 10, trigger; 11, ramrod stud.

Cut No. 3 is the arm opened, showing the disposition of the parts when the weapon is ready for the reception of a new cartridge. It will be seen that the force of the recoil is carried down through the breech-block to the hammer block, and in that way transmitted to the hammer pin, and so to the breech frame ane stock. The arm is one of the simplest to take apart in case of necessity. To do so turn the screw in the side of the receiver that holds in place the two large pins (hammer and breech-block pins) sufficiently to release the heads or flanges, then turn them away from the screw. Bring the hammer to full cock, take out the extractor screw (found on the side of the receiver below the breech-block pin), take out the breech-block pin and remove the breech-block and extractor together. Let the hammer down so as to relieve it from the pressure of the main spring, take out the hammer pin and the hammer.

To assemble the arm put the hammer in position in the receiver, pressing it forward so as to avoid the pressure of the main spring, put in the hammer pin and cock the hammer. Put the breech-block and extractor into the receiver together, as when taken out, and after replacing the breech-block pin and extractor screw, bring the flanges of the two side pins together and tighten the screw that holds them.

The arm is a comparatively cheap one, the prices running:

Muskets—.433-caliber, length of barrel 33in., weight 9lbs. 5oz., $15; .45-caliber, length of barrel 33in., weight 9lbs. 3oz., $15; .50-caliber, length of barrel 32½in., weight 9lbs. 3oz, $14. *Carbines*—.433, .45 and .50-caliber, length of barrel 20½in., weight 7lbs. 2oz., $13; .50-caliber, with rim and center fire breech-block, $13. *Light or Baby Carbines*—.45-caliber, rim fire, length of barrel 19½in., weight 5lbs. 13½oz., $13; .44-caliber, extra light, either center or rim fire, length of barrel, 18½in., weight 5lbs. 7oz., plain military finish, $13. The .44-caliber carbines are chambered for the .44-rim fire shot, long and extra long Winchester, and the .44-rim fire flat (Winchester '66 model). The .44-caliber center fire Winchester '73 model, or the .44-caliber central fire Smith & Wesson cartridges. When ordering, it must be stated which of the above cartridges it is desired to use, as they are not interchangeable. *Sporting and Target Rifles*—.38, .40, .44, .45 and .50-caliber central fire; .33 and .44-caliber rim fire; barrels 26 to 34in. long, weight 8 to 10lbs.; .44-caliber central fire, chambered for 40, 60, 77, 90, 100, or 105 grain cartridges; .40-caliber central fire, chambered for 50, 70, or 90 grain cartridges; .45-caliber central fire, chambered for 60, 70, or 100 grain cartridges; prices from $18 for round barrel, open sights, to $38 for Vernier and wind-gauge sights, spirit level.

A C Rich	8	10	9	9	9	9	11	9	7	7	— 88

BOSTON.—Some very fine shooting has been done the past week at the Mammoth Gallery, as the scores will show. Mr. M. L. Pratt has the lead for the first prize, and A. B. Loring for the second, and H. M. Drew for the third in New Beginner's match:

Amateur's Match No. 1.

M L Pratt	46	46	46	47	48	—233
A B Loring	47	47	46	46	46	—232
R Ford	46	46	46	46	46	—230
B W Gardner	45	45	45	47	47	—228

New Beginners—Amateur's Match No. 3.

H M Drew	43	43	43	42	44	—215
E A Peirce	41	44	41	41	43	—210
W Gray	42	41	42	42	40	—207
E F Stevens	39	40	40	41	40	—200

JAMESTOWN, N. Y., March 27.—At our club medal shoot to-day the following scores were made, 200yds. off-hand, 10 shots on Creedmoor target, wind light 5 o'clock:

A F Warner	5	5	4	5	3	4	4	5	5	5	—45
R H Burns	4	5	4	5	4	5	4	5	4	4	—44
G W Shattuck	5	4	4	3	4	5	g	4	5	4	—43
S N Ayres	4	4	4	4	3	4	4	5	5	5	—42
O H Lilly	3	4	4	5	3	5	4	5	5	4	—42
W Sprague	4	4	3	4	4	3	4	5	4	4	—39
H Briggs	3	4	4	3	4	4	4	4	4	3	—37

NEW YORK, March 20.—Regular weekly shooting of the Bullshead Rifle Club, 322 Third avenue, 12-ring target, possible 120: G. Zimmermann 118, M. Dorrler 118, C. Rein 118, A. Lober 117, J. F. Campbell 106, J. Jordan 106, W. D. Seltzer 101, S.F.C.Weber 96, D. Lowinskie 97.

GRAND CENTRAL TOURNAMENT.—The following are the best scores made in the tournament at the Grand Central Rifle Range, No. 5 Vanderbilt avenue:

J H Brown	67	67	67	66	66	—333
A Oehl	68	65	65	64	63	—325
G Zimmerman	65	65	64	64	64	—322
W M Farrow	66	63	63	63	62	—317
Wm Kline	62	62	60	60	59	—303
C Rein	61	60	60	60	59	—300
Wm Simpson	62	60	58	58	57	—295

C Edgar	57	53	53	51	42	—256
Dr Toal	51	50	50	49	47	—247

For the week ending March 31.

MINNEAPOLIS, Minn., March 28.—To-day the first long-range shooting for 1884 was done on our range; wind very fishtaily and strong from 5 to 8 o'clock, and bright sun at 800yds.; both wind light; much better at 900yds.; only one flag on the range. Great difficulty was experienced in finding the target, and to the surprise of all the elevations at 800 were up to one or two points of our figures of last summer's 900yd. elevation. The following scores, considering the weather condition and the first practice of the season, does not discourage us. No sighters at 900yds.:

	800yds.	900yds.
Cale Maudlin	5355544555355385—69	5355555555355555—71—140

J Cooley	4525555544435054—62	5555315503453415—61—123

Wind Gauge.

BOSTON, March 29.—At Walnut Hill to-day the conditions of the weather were not good for high scores. The light was good, but the wind blew from 12 o'clock, and was tricky, and spoiled good holding. J. B. Fellows, with his new .32-caliber Maynard, made a clean score of ten bulls, counting 88 out of a possible 100 on the paper target. This was his first clean score, and it is the first clean score ever made with a gun of this description. Capt. H. G. Parker, of the Carson City Rifle Club, of Carson City, Nev., who is visiting friends in Boston, was present and made some good shots. He stated that he thought the range the finest of any he had seen in this country.

Creedmoor Practice Match.

H Cushing	4454544545—44	H G Parker (mil)	4454534444—41
H A Barnes	4544545445—44	D F Farwell	3544554434—41

The West Medford (Mass.) Gun Club has elected the following officers: President, C. H. Parker; Vice President, E. F. Kakas; Treasurer, J. E. Ober; Secretary, W. T. Morse; Executive Committee, J. A. Rockwood, E. G. Morse, F. O. Brown.

THE TRAP.

ST. CLAIR, Pa., March 29.—Fourth monthly contest for club's silver medal, was held by the St. Clair Sportsmen's Club, Feb. 22, resulting as follows:

Sproats	0001101100—4	Daddow	0111001011—6
Farne	00100100w—2	Evans	0000101011—4

Daddow won the medal.

Fifth contest took place to-day with following result:

Evans	1001111100—6	Sproats	1011100111—7
Long	1000101101—5	Walker	0110100111—6
Daddow	0000010110—3	Lee	0001110000—3
Little	0010011110—5		

Both shoots were at clay pigeons, 18yds. rise, 2 Ligowsky traps screened, 3d notch, angle 30 degrees, direction of flight changed for each shot.

COLLEGE MARKSMEN.—Harvard has a live corps of marksmen. Last year the shooters in college were found to be numerous enough to warrant the formation of a shooting club. Now some of the riflemen of the club propose to organize a rifle team, with an eye to intercollegiate matches. Friday afternoon last the gentlemen interested met in the room of J. A. Frye to talk over the project, and the outcome was that it was decided to send letters to Yale, Columbia, the University of New York and the University of Pennsylvania in regard to forming an intercollegiate rifle association. The University of Pennsylvania already has a rifle team, and possibly such teams exist at the other colleges. If favorable replies are received, the Harvard boys will put a team in training at once. Where they will shoot is not yet decided. There is a range up toward Arlington, used by the militia companies in Cambridge, which may be secured, or perhaps the arsenal range in Watertown may be used. If a team can be got together, however, it will not be very hard to find a place to practice, and there are plenty of teams in and around Boston to compete with. The shooting club use the grounds of the Middlesex Club at East Watertown, and are very handy for the college men. A

month ago a friend of the shooting club, a graduate of another college, manifested his interest in their work by offering a cup, called the Walnut Hill Cup, to be given to the man winning in three competitions. W. L. Allen, '86, won the first, breaking 12 balls out of 15 at 18yds., five traps, W. H. Slocum, '36, second, with 13 out of 15; C. C. Foster, '87, third, and in shooting off a tie with F. S. Palmer, '87, both having broken 11; the fourth was won Thursday last by W. H. Slocum making his second victory. The next match will be held April 10. The club has about sixty members, mostly in the lower classes. The officers are: J. A. Frye, '86, President; H. S. Abbott, '86, Vice-President; E. B. Austin, '86, Secretary; J. G. Abbe, '86, Shotgun Executive Officer; J. A. Frye, '83, Rifle Executive Officer; W. H. Goodwin, '86, F. S. Billings, '85, J. S. Russell, '86, Directors; E. J. Sartelle, '85, J. C. Bradley, '86, W H. Slocum, '87, Match Committee. A great deal of the credit for the formation and prosperity of this club is due to its president, Mr. Frye, whose scores at Walnut Hill have made him a creditable name as a rifleman. He is as active in the Harvard Club as his father is in the Massachusetts association.

TORONTO, March 28.—The match pigeon shoot between J. C. Cockburn, of Toronto, and G. Wayper, of Guelph, came off to day at John Oulcott's shooting grounds at Englington. The weather was all that could be wished for, the attendance large and the birds first-class. Match for $100 a side, 35 birds each, 21yds. rise, Dominion rules:

Wayper	111011010101110101111101101010101—24
Cockburn	101011010101111111010111111101010—24

In the shoot off at 26yds., the following was the result:

Wayper	0 1 1 1 0—3
Cockburn	0 0 0 1 1—2

FAIR HILL, Md., March 29.—We had a glass ball match here today, two men on a side, 25 balls, 21yds. rise, straight away trap.

J Peterson	0110110001101101000111 1—15
E S Garret	1110111111111011111111 1—23—38
J Warren	0100100011101111010000111—12
F Foot	1111111 1111111111110111—24—36

UNKNOWN GUN CLUB.—The regular monthly match held at Dexter, Long Island, March 27. Weather clear with a strong blow, making the birds go like blue rocks. Twenty-eight members participated in the match, this being the second shoot for three extra and three regular prizes. Vogelsang took first; Smith, Rathjen and Monsees divides second; Van Staden, Knebel, Layton, Tomford, Herman, Stillwell, Muller and Detlifsen shot off for third prize, miss and out. After one round, Knebel, Layton, Tomford and Herman divided. The next shoot, April 24, will decide who will be the lucky ones for the three extra prizes. The conditions were handicap rise, one barrel, club rule and classified.

THE LIGOWSKY TOURNAMENT.—Some objection being made to the use of Dixon's measure in the shot of the tournament, Mr. J. E. Bloom, the president of the company says: "The sportsmen hereabouts whom I have consulted on the subject, are unanimously of the opinion that whereas said Dixon's measure 1106 or 1107 is now the common standard throughout the country, it should remain the standard for the tournament, but that the subject should be brought before the assembled sportsmen at Chicago for action as to future tournaments." This appears to be equitable. This question affords another argument, why we should have a National Association to adopt a common code."

MERIDEN, Conn.—Shoot for Individual State Medal, at Meriden, Wednesday, March 26. The medal was held by E. A. Birdsey, of Meriden, who won it at Wallingford two weeks before. He was challenged by thirteen men to shoot on the 26th. Although it rained hard they shot for it at the Park, at 50 clay-pigeons each, and it was won by E. A. Folsom, of New Haven. Following are some of the best scores out of a possible 50: E. A. Folsom 45, L. L. Baker 44, C. M. Spencer 42, H. Nichols 42, J. K. Camp 41, J. F. Ives 41, E. A. Birdsey 40, I. Ferguson 40, J. Talbot 38, G. A. Strong 36, H. L. Roberts 34. The medal is to be shot for every second and fourth Wednesday of each month.

PAWTUCKET R. I., March 13.—Union Club, match for State Badge, weather stormy: C. B. Payne, Union Gun Club, 23; W. H. Sheldon, Narragansett, 23; C. M. Sheldon, Narragansett, 18; C. C. Gray, Narragansett, 22; G. F. Butts, Narragansett, 16; E. S. Luther, Watchemoket, 20; F O. Wehoskey, Narragansett, 15; G. W. Barney, Watchemoket, 17; E. W. Tinker, Narragansett, 23; M. P. Cornell, Mashapang, 9; J. F. Elderkin, Union, 7; C. B. Potter, Narragansett, 18; E. H. Roberts, Union, 20; F. S. Tingley, Watchemoket, 17; G. W. Cary, Narragansett, 22; F. Baldwin, Narragansett, 20; H. L. Palmer, Narragansett, 24; J. R Payne, Union, 11, A. F. Salisbury, Union, 14; J. H. Brady, Union, 18.

BOSTON, March 26.—The clay-pigeon and glass-ball matches at Walnut Hill to-day called together a large attendance of shotgun men. Sixteen matches were shot, and the result's in each are appended:

First event (five clay birds, 11 entries)—Stark first, De Rochemont and Bancroft second.

Second event (five clay birds, 11 entries)—Stark and Short first, Johnson second, Bancroft third, De Rochemont and Cutting fourth.

Third event (five clay birds, 23 entries)—Stanton and Field first, Stark and Decker second, Cutting, Jameson and Nichols third, and Bancroft fourth

Fourth event (three pair birds, 19 entries)—Sawyer first, Stanton second, Stark, Hutchinson and Hart third, Knowles and Short fourth

Fifth event (five glass balls, 18 entries)—Decker first, Hutchinson and Johnson second, De Rochemont, Lovejoy and Newton third Short, Sawyer and Russell fourth.

Sixth event (five clay birds, 25 entries)—Sawyer first, Tinker and Adams second. Decker and Stark third, Short and Shattuck fourth:

Seventh event (three pair clay birds, 24 entries)—Stark, De Rochemont and Hart first, Stanton, Law, Knowles and Short second, Decker and Johnson third, and Jameson fourth.

Eighth event (five glass balls, 20 entries)—Tinker and Henry first, Stark and Field second, Lovejoy, Shattuck and Lewis third, and Moore fourth.

Ninth event (three pair balls, 13 entries)—Decker first, Lovejoy second, Law and Hutchinson third, and Newton fourth.

Tenth event (seven clay-birds, 29 entries)—Decker and Stark first, Nichols and Lovejoy second, Tinker third, and Bancroft fourth.

Eleventh event (five straightaway birds, 29 entries)—Stark, Shattuck and Dodge first, Stanton and Short second, Nichols, Russell and Newton third, Bancroft and Henry fourth.

Twelfth event (five clay-birds, 27 entries)—Field first, Stark and Johnson second, Parker and Lovejoy third, Decker and Newton fourth.

Thirteenth event (five glass balls, 18 entries)—Sawyer, De Rochemont and Johnson first, Henry and Moore second, Decker and Nichols third, and Knowles fourth.

Fourteenth event (three pair clay birds, 20 entries)—Decker first, Parker, Favor and Sawyer second, Tinker third, and Bancroft fourth.

Fifteenth event (three pair glass balls, 13 entries)—Law first, Bancroft second, De Rochemont third, and Knowles fourth.

Sixteenth event (five clay birds, 14 entries)—Field first, Stanton and Stark second, Johnson and Russell third, Warren and Noyes fourth.

Yachting.

BUSINESS.

THE efforts in these columns looking toward the general practice of racing and cruising outside are bearing excellent fruit. The mere thought of such a thing still sends a shudder through the antique relics of a past age, and some people in their nautical swaddling clothes. But the world does not stop progressing for them, which is fortunate. The number of races outside is constantly increasing, and whole fleets now cruise along the coast. Long Island Sound is fast becoming to be regarded only as the Swash Channel of the East, and nothing more than a fairway into port, excellently suited to beginners practicing in small traps and sailboats, but quite *infra dig* for that yachting in which men prefer to engage. The American is ambitious, and the notion that the brawn and muscle and enterprise of a live crowd of sea-loving people could forever be pent up in a little stretch 90×10 miles always struck the genuine yachtsman as supremely ridiculous, to say nothing of the impossibility of reaching the Sound from distant ports without a passage at sea.

However, counterfeit yachting is losing its charms with the rising generation. We hail with pleasure the proposition of Mr. J. D. Smith, of the Estelle schooner, to offer a cup to sloops and cutters for a grand scramble round Long Island by the outside route. The New York Y. C. has abandoned play sailoring in the Sound, and will hereafter meet in Newport harbor preparatory to the regular annual cruise along the coast. It is proposed to give the sloops and cutters some inducement to make the voyage to the rendezvous an interesting event and with great benefit to the sport, and for these innovations upon ye ancient customs of drifting, the club has earned recognition from all go-ahead people. With sea cruising and ocean races a prominent feature, perhaps in the end to the entire exclusion of smooth-water play, we may look for rapid strides in the improvement of model and equipment, and the crews of our yachts, professional and amateur, will develop into regular shellbacks even before they know it. Then will come the consummation of our wishes, yachting real instead of yachting sham.

WEIGHT FOR LIGHT AIRS.

IF there is one thing which experience has settled beyond the possibility of doubt, it is the value of weight for speed in airs and light breezes. Practice affords such incontestable proof that writing these lines ought to be superfluous work. And yet the culpable ignorance among builders and amateurs is such that valuable space must be occupied, to teach what the tyro ought to known by mere intuition. Why people, who have been successful in other walks of life, refuse to apply to the matter of yachting a single turn of their brain, and not only refuse to think the most trifling kind of a thought, but persist in clutching wildly at that which is diametrically opposed to the commonest process of logic and familiar facts enacted under their very noses day after day, is a poser in the study of human nature we are totally unable to fathom.

If there is one kind of boat which excels in a most notable degree in lightness and in large sail area in proportion to her displacement, it is the catamaran. According to the hallucination of those people who ever and anon pop up before the public with the same old, daft illusion which mixes up weight and resistance, the catamaran ought to be a streak of lightning incarnate in trifling winds and in the coyest of catspaws, in the merest breaths trembling through the atmosphere, should show at her best and fly from heavier boats so as to knock them stupid. There is no boat in existence which can be expected to substantiate the "light weight for light airs" fallacy in more drastic and unchallengeable manner. And now what is the truth concerning the sailing of catamarans? They are slow, excessively and annoyingly slow, and notoriously so in light airs. They cannot be depended upon to stay and they are left out of sight by almost every hulk, tub, scow, box or fright which has weight and reasonable area of sail.

Why is a catamaran slow in light airs? It cannot be because of clumsy lines or unfavorable form. Her body is leaner, her lines are finer and more suited to speed than those of any other type of yacht in our waters. It cannot be a want of driving power, for measured by any standard whatever, by length, by bulk, by displacement, by stability, by area of skin, by draft, she has a larger sail plan than any other style of vessel, and she has *not* the weight. And to the very lack of that weight her sloth in light airs must be attributed. To nothing else whatever.

When a boat has got on full headway the force of wind will allow, she develops "momentum" in strict proportion to her weight. The effect of that momentum is to keep up her rate of speed. She is possessed of a desire to continue, and if the wind were cut off in an instant as with a knife, she will keep on moving, slowing up gradually as she uses up her momentum in overcoming resistance to onward passage until there is no momentum left to draw upon. Then she stops.

Now, all winds, especially light winds, are a series of rapid impulses, whose energy is transmitted to the hull through the sails as a medium. When a boat has acquired full way every succeeding impulse finds the boat already on the move, and in striking the sails has not to start a dead body into life and overcome "inertia," but the energy of succeeding impulses is utilized in re-supplying the waste of momentum which is continuously being eaten into by the opposing resistance. If a surplus of energy remains the boat will be impelled at an increased speed. Now, it is plain enough to see that the boat possessed of the greatest momentum in proportion to resistance will have her store of moving force eaten into least by the opposing resistance, and that there must be a larger surplus of wind impulse left to be utilized toward speed than in a competitor having a less favorable ratio between momentum and resistance.

But resistance at low speeds is mainly, if not entirely, due to friction between the water and the skin of the hull. Now, the area of skin will vary directly with the dimensions, but the momentum of displacement or weight, which is the same thing, varies in a higher ratio, in similar forms it varies as the square. Thus, two boats of circular section having diameters as 1 to 2 will vary in circumference or skin as 1 to 2, and so will their resistances at low speeds. But the areas of the two circles will vary as the squares of 1 and 2, or as 1 and 4, so will the bulk on any unit of length, and so will the momentum of those bulks.

It follows in direct consequence that, with a given sail area per unit of skin surface, the boat having the *greatest weight* is possessed of an innate advantage for speed in light weather.

Furthermore this advantage may be so great that even with a less area of sail per unit of skin, the heavier boat will still in practice prove the faster. Henee the catamaran, in spite of large sail area in in proportion to wet surface, is overcome in a contest by heavier boats driven by actually less power in comparison.

It is true that secondary attributes may in particular instances neutralize and even more than wipe out the innate advantage of weight. A boat may be so crank or so modestly sparred that the gain due to weight is more than lost by the deficiency of driving power. Or in the other direction, she may have large sails, but her hull may be so extravagant in contour that a superabundance of skin will be a drawback, overbalancing advantages of weight. When such boats are beaten their defeat is not to be laid in truth to their great weight *per se*, but to the fact that opportunity to display the benefits of weight is denied the boat through irrelevant conditions having no connection with the question of light versus large displacement.

By inference from the foregoing, it follows that the problem of speed in light weather is to be solved through working up as near as possible to the subjoined axiom.

"The *greatest* weight *in proportion* to the resistance, coupled with the *greatest* sail area *in proportion* to skin friction."

And a corollary to the above is this: The mere comparison of weights, ten tons against twenty tons, has no meaning whatever, one way or the other, unless the citation be made in connection with the resistance. And under no circumstance does twenty tons in itself indicate a bar to speed in comparison with ten tons, for it is always possible that the excess of the momentum of twenty tons beyond the resistance it experiences may be greater than that of a boat displacing only ten tons, in which case, so far from being a bar, the greater weight is by the foregoing an actual advantage, and upon the assumption of equal sail to wet surface, an actual, positive benefit to speed. The opposite is equally true. Light weight, or in our example, ten tons, considered by itself, is not to be accepted out of hand as a bar to speed for lack of weight in comparison with twenty tons, for it is also possible that in proportion to the resistance of a particular boat there may be a greater excess of momentum on ten tons displacement than on twenty.

So far then as the theory of speed in light winds is concerned, the conclusion is, that weight by itself affords no true inference for or against, but that the answer depends upon the relation between momentum and resistance in each individual vessel, and that unless acquainted with that relation, no decision in the case can be rendered for want of necessary data upon which to construct a verdict one way or the other.

We are then in need, not only of the weights of vessels, but also of their resistances to pass judgment between a light and heavy competitor. It has already been mentioned that at low speeds resistance varies with the area of wet surface. Hence, of two designs, that one possessed of the greatest weight per unit of skin is the winning boat, *providing* she can spread to equal effect as much sail per unit of wet surface as her opponent, and upon this the designer must scheme his hopes for success in light weather. It will be readily seen that in theory the advantage may rest in one case with the heavier boat and in another with the lighter, according as they meet the stipulations set forth.

Now turning to practice, we find the application of the last paragraph exemplified in the apparently contradictory performance of vessels. Upon one occasion a heavy boat has decidedly the heels of her lighter competitors, and upon some other occasion just the reverse is observed between another batch of racing vessels.

But those contradictions are between yachts approaching one another in their principal elements, so that a slight variation upon the relation between momentum, resistance and sail will bring down the balance on one side first and then again upon the other.

For a broad conclusion, the evidence should be taken between boats differing quite radically, so much so that the prominence of their peculiarities cannot be overthrown by trifling variations between momentum, resistance and sail. And such comparisons manifestly offer all the more positive answer to the issue between light and heavy displacement, surrounded, as it must be, by those features which design demands for practical purposes.

We have already instanced the performance of catamarans. Exactly the same behavior is found in light boats of any description. It is well enough known that the sharpie, the canoe, the whaleboat, the buckeye, and similar boats, one and all, fall prominently in competition with yachts of usual form in light weather. By comparison the light boats are tediously disappointing, and no matter how much pains and thought may be bestowed upon their planning, it is from the very start a physical impossibility to attain speed with them in paltry breezes. And this is due to the lack of as much weight and as great momentum in proportion to resistance just as explained in the case of the catamaran. Most prominently does this want make itself felt in beating to windward. The lines of such boats, are, in themselves, highly favorable to speed, and the sail which racers spread is enormous, and far beyond that of usual yachts in proportion to skin, as witness the racing rigs of some canoes in New York waters. While they occasionally do well with lifted sheets in winds of good working strength, all collapse in light airs and when sheets are trimmed in.

It is a familiar fact to yachtsmen who have met the much lauded sharpie in Long Island Sound, that, unless a strong quartering wind be blowing with the water smooth, the sharpie has no chance whatever with the heavier craft, and the lighter the wind, the slower the sharpie proves herself to be.

Theory explains the source of value in weight and practice, common, everyday practice, transacted under the nose of every person afloat, backs theory in its decuctions and *defends and directly counsels* the incorporation of weight in vessels intended for speed in light winds.

The builder who declines to enter upon a course of logic for fear he may be only theorizing after all, and the yachtsman who is too shiftless to think for himself, may possibly be excused upon the ground that in the pursuit of yachting they undertook no other contract than to loaf. But when such persons not merely refuse to mentally imbibe the kaleidescope of facts developing daily before their eyes, but aggressively storm in a path barred at every step with insurmountable facts, and pilot themselves into a foggy realm of dogmatic myth, then, we confess, then it makes us very tired.

DRAFT.

Editor Forest and Stream:

Mr. Bassford's letter contains one point which perhaps needs attention in addition to the remarks you appended. He says the channels with 10ft. water leading into the harbors are so narrow that a keel boat drawing that amount could not work in them. A centerboard drawing only 7 or 8ft. would have to show some of her board to get in and out, and would draw just as much, and sometimes more than the keel boat, so she would be no better off. MINX.

[We add that there is from 3 to 7ft. of tide in all the Sound ports, and it would only be one case in many when a yacht would try to make certain harbors with narrow approaches at dead low water, and the width of the channels would be greater at quarter or half tide. But even in this respect we are better off than our English cousins, who have to depend upon many harbors which are tidal altogether, and dry or nearly so at low water. Same holds good of the Dutch, Belgian and French coasts. Besides, it seems better policy to have the right kind of boat for sailing anyway, and make harbors as best you can. The test of a good boat is not how little water she can float in, but her adaptability to cruising in whatever depth she happens to need. Designing boats to meet secondary requirements at a sacrifice of the principal object of their existence, is getting the cart before the horse.]

PETREL ON A CRUISE.

Editor Forest and Stream:

I see you have the lines of Petrel in FOREST AND STREAM, and as you laud her performances highly, I thought an account of the three first days' cruise of the Seawanhaka Y. C. in 1880, so far as Petrel and Vivien took part in it, might be interesting. Vivien I do not consider very fast. She is a pieced-out boat, having originally been a 24ft. cat. She was raised 8in. and pieced out aft so as to make her 25½ft. waterline and 28ft. over all. This left her very full forward, and brought her board entirely too far forward, which made her steer hard and work bad, as an old sail from another boat was put on her which did not fit. She is a veritable little tub, but here is an account of her performance in company with Petrel, these two boats being the only boats of that class in the cruise. The account was furnished me by her skipper.

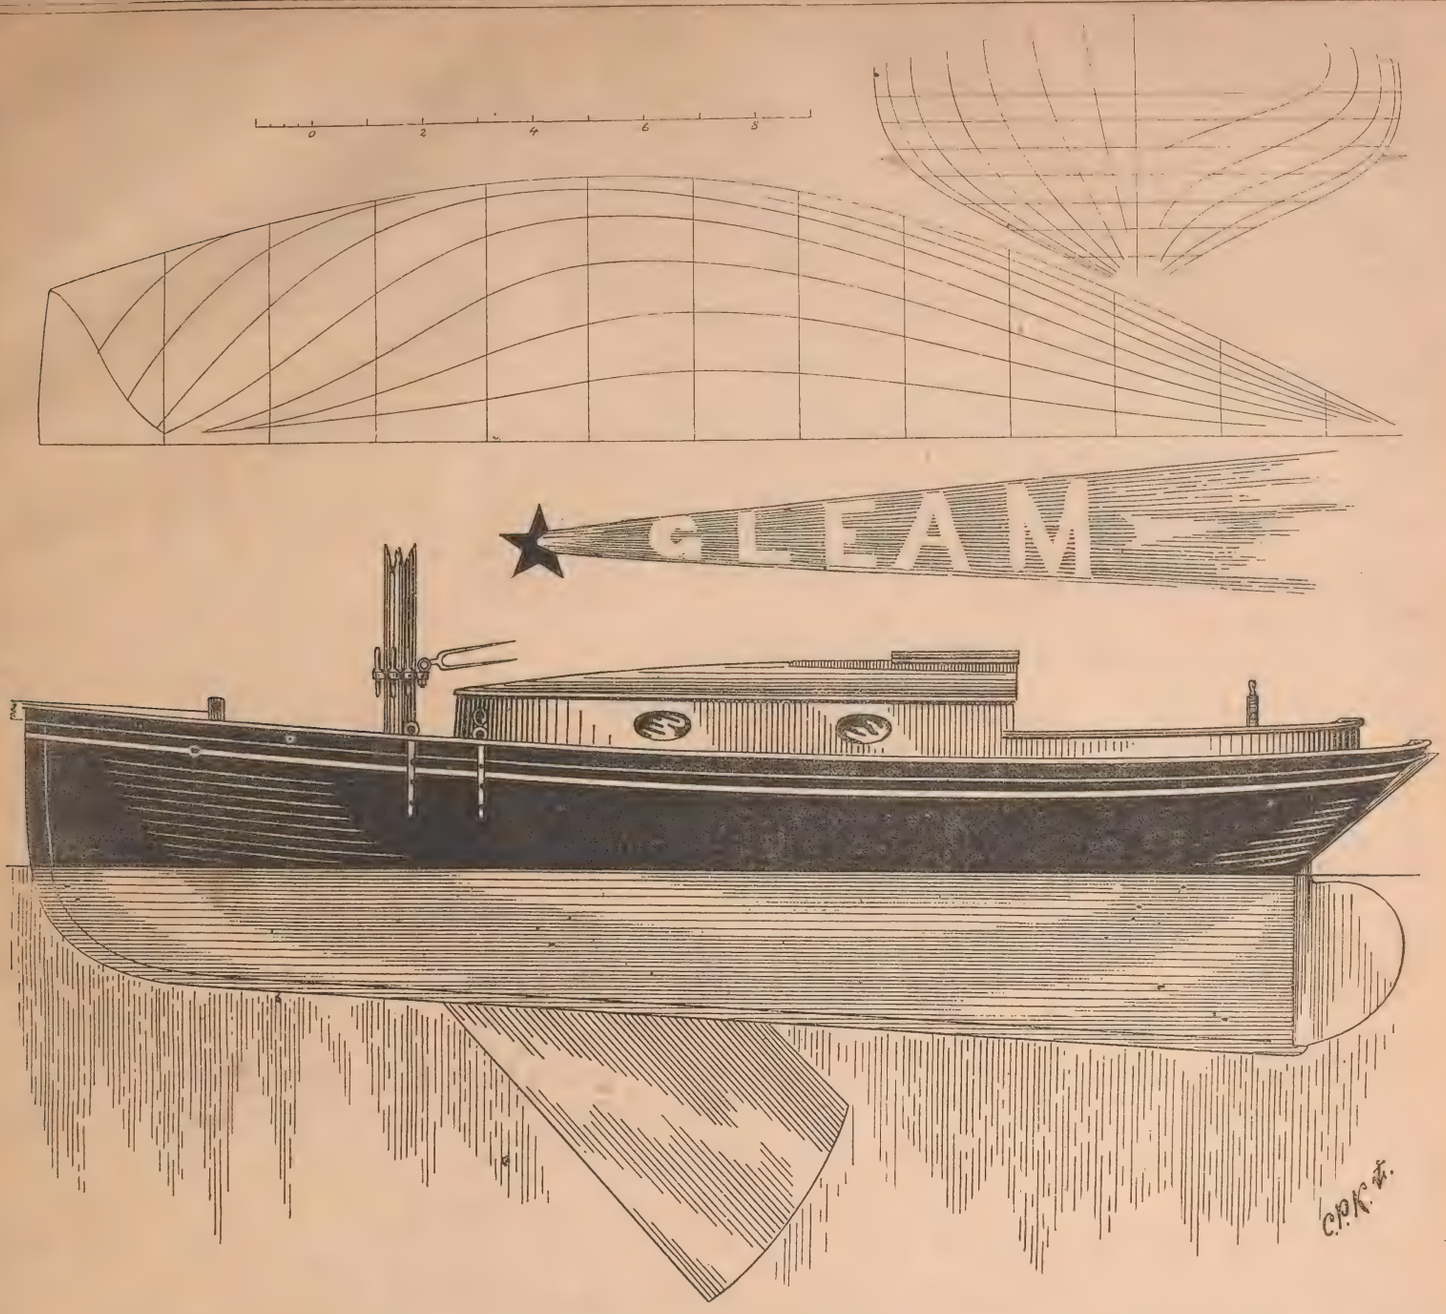
The yachts met at Glen Cove. The next morning they were ordered to make a run to New Haven. There was scarcely any wind until some time in the afternoon. There was not a ripple on the water. They all drifted on toward Eaton's Neck. Vivien had no light sails, but a very small topsail with no yard, so she set it as best she could on an oar. She had but just been launched after being altered, and there had not been time to finish her for the cruise.

Petrel had a good outfit of light sails, so she worked away somewhat from Vivien. When near Eaton's Neck the latter struck across for the north shore, thinking the wind would come out from that way, and Petrel kept the Long Island shore. Finally the wind came out fresh from south and Petrel of course got it nearly half an hour before it reached across to Vivien, and by that time Petrel was nearly out of sight ahead. Besides this Vivien was so far to leeward that she could but little more than lay her course, while Petrel was running with sheets lifted. Vivien arrived at New Haven about six minutes behind. The next morning the fleet was ordered to New London and the two little ones were given the privilege of starting ahead. It was blowing fresh from southeast. Petrel got away first with a reef down. Vivien had run further up the harbor, so was some distance astern and to leeward. It was a dead beat out the harbor, and Vivien, under full sail, caught up to Petrel, who then shook out her reef, but Vivien was getting away from her in the meantime and when a good distance ahead the wind suddenly died out.

A while after there came a rain squall from the southwest, and both had to double reef. Then they were shut out of view by the rain until well on toward New London. The wind once more died out and the rain ceased, and it was discovered that Petrel was hull down astern, but much further to the south, or out in the Sound, than Vivien. Again they lay becalmed, and again the wind came up from the south and took Petrel long before it did Vivien, but she got it at last, and arrived at New London about 7½ minutes ahead of Petrel. The next morning the larger yachts had arrived, and Petrel and Vivien were told they might see as much of the race as they liked, and then run to Newport, which the larger yachts would do later in the day. Petrel soon started out, as was supposed by Vivien, to see the race, but when Vivien left later she found Petrel had made a straight wake for Newport. So she concluded not to go any further east and ran over to Greenport, leaving the fleet, as she then had no cabin on, but was an open boat. DAVID KIRBY.

[Since then Vivien has received a cabin, and will come out in a new rig and general overhauling this season. Mr. Kirby does not state whether Vivien shifted ballast or not, though the presumption is she would not do such a silly thing.]

STYLE.—To a man of taste, there is nothing uglier than paint about decks and deck fittings. It gives a boat an old and cheap appearance, and shows the blacking off lubbers' longshore brogans. Remove the old paint and varnish or keep "bright," and the yacht will appear rejuvenated. To remove, either apply heat carefully by means of a hand brazier and then scrape; or pay with one part pearlash mixed with three parts of quickstone lime, by slacking the lime in water and then adding the pearlash. Allow to remain half a day, till the paint softens, then scrape with scraper, or glass and sandpaper smooth. Varnish hatches, houses, bits, cockpit and inside of bulwarks, but leave the decks and the caprail natural wood. Keep them white by scrubbing frequently, and then the boat will "brace up and have some style about her." It is just as easy to keep her in that condition as to keep paint clean, and the boat will sell for 20 per cent. more. To paint the side, scrape very carefully and lightly. Broken glass is the best tool. Don't dig into the wood. All paint need not come off, but the rough should be smoothed away. Then sandpaper, put on a light coat with plenty of oil. Let it dry well, for which time is required. Then give finishing coat with varnish enough to give a gloss and drier enough to harden, as the oil will not sink into the wood as with first coat.



ARRIVED.—The handsome s. s. Santa Cecilia arrived in this port March 27 from Havana, and took up a berth in North River. She was built by John Elder, of Glasgow, in 1881 for Lord Alfred Paget. Is 163ft. long, 23ft. 7in. beam, and 12ft. 3in. hold. Compound engines 18 and 36in. cylinders by 33in. stroke, of 80 horse power. Rigged as a three-masted schooner. She is a cruising steamer with a maximum speed of thirteen knots, and a sea speed of nine to ten knots on very small consumption. As a cruising steamer she is an age ahead of the costly and ugly failures at high speed in this country so extravagantly advertised by newspaper reporters.

NEW BEBFORD, Y. C.—J. C. Rhodes, Commodore; David L. Parker, Vice Commodore; Frank E. Sawin, Rear Commodore; John H. Barrous, Secretary; Executive Committee, Francis Hathaway, Willard Nye, Jr., Edward S. Brown, Horace Wood, George M. Crapo, Richard S. Taber, E. Stanley Willis, George W. Parker, Richard H. Morgan, Edward W. Hart and the officers. Membership, 258. Fleet includes 57 yachts. Measurement one-quarter overhang added to loadline.

NEW JERSEY Y. C.—Annual match fixed for June 19. Officers for the year: Commodore, John H. Longstreet, catamaran Duplex; Vice-Commodore, R. F. Rabe, sloop Minnehaha; Recording Secretary, John D. Goetschius; Corresponding Secretary, George E. Garrison; Treasurer, Charles J. Rogers; Financial Secretary, Henry H. Stilling; Measurer, William S. Dilworth; Regatta Committee, Edward W. Kecham, Henry C. Dilworth and Edwin A. Barkelew.

NEW MAGAZINE.—We learn that a Boston publishing house will issue an illustrated yachting monthly early in June. There is room for an independent publication of the kind with literary merit, and it ought to be a success if it will steer clear of the breakers of "partisanism" and covert advertising in its leading pages, which have wrecked such feeble attempts as have been made to catch public support.

TOLEDO Y. C.—Has leased Guard Island for club purposes. The fleet includes ten yachts, with one cutter now building by Messrs. Hepburn Bros. Officers for the year: Commodore, F. W. Kemp; Vice-Commodore, A. W. Macken; Rear-Commodore, Prof. L. Mathews; Secretary, Harry Pratt; Treasurer, John W. Kelsey; Measurer, Joseph Hepburn.

GLEAM.

As a centerboard yacht considerably advanced beyond the orthodox trap, the Gleam can be taken as an excellent representative of recent date. She is of more than ordinary shapeliness, with claims to style in her whole make up. Her lines will prove of special interest to those who have to moor in shoal water, or cannot avail themselves of the keel for particular reasons. The Gleam is a copy of one of Philip Ellsworth's small boats, with some minor modifications introduced by Mr. N. D. Lawton, for whom she was built last spring. Clumsier dimensions could scarcely exist, yet in spite of their exceptional proportions the Gleam exhibits that unrivalled clean cut fairness of body for which we have often put the Ellsworth models on record. This extreme fairness, which scarce any man can equal, coupled with enormous light weather rigs, is the real secret of the success of the Ellsworth boats so far as speed is concerned, and it is almost a hopeless task to expect to beat such beautifully chiselled masterpieces with other craft many rungs lower on the ladder of perfection in fairness of form, and this is without any reference to type. In view of the varied results of trial races during the past few years, we are more than ever convinced that far too much stress is laid upon mere type by itself when the question of speed is agitated, and that the clue to success should be sought in the most perfect distribution of bulk and general symmetry of hull, let the cardinal dimensions be what they may. We have all seen square races won by out and out cutters, by half-breeds with and without keel and with a little of both, by orthodox traps of a past epoch, and by all kinds of go-betweens.

Extensive and close observation will, in the long run, justify our views that all types within certain not well defined limits, can be made to reach equally high rates of speed, though some will excel under certain conditions, and others again under an opposite state of affairs. But it will ever be a losing game to pit against perfection of one type anything of another possessed of less sweetness of form. So far as speed is the issue, it may be laid down as a truism that a good cutter will beat an inferior sloop, and a good sloop will beat an inferior cutter, and a good cutter and a good sloop will make an even sail, extraneous influences left out of consideration. In point of type all stand alike, and the victory will perch upon the most symmetrical arrangement of bulk, with no reference to the dimensions. In more detail, though, there seems to be evidence enough at hand that the deep, narrow keel has the call in light and baffling wind, and in any kind of weather accompanied by a sea, while the sloop's especial opportunity will be found in smooth water, and good whole sail breezes. All of course subject to more or less modification, as facts are sprouted by events in the future.

With this in mind it is an easy matter to find good cause why Gleam, upon very uncouth dimensions, should nevertheless show excellent speed in the weather she likes. Not one man in ten thousand could produce her equal in form on the length, beam and depth she possesses. For this reason alone, if for no other, the boat which tackles Gleam tackles a Tartar, and the boat which beats her has something about which she may lustily crow. We are far from indorsing Gleam's proportions. The same bulk, ballast and rig could have been disposed to much better advantage in a longer, deeper body of easier fashioning, with a gain in performance and accommodations, but then the odious length rule steps in and threatens a tax for any such choice. The designer finds himself shackled in face of that foe to good proportions, which compels him to stunt his ideas in length and squat out in beam for the size he must have in search of power and general ability. Consequently the Gleam is the reverse of an economical boat in any respect, and for her size and the money expended does not represent the best attainable by any means, though she may be the best or nearly the best on the length. It is unfortunate that a rule which hampers independent development of form and fosters false standards of excellence should prevail, but at present there seems little hope for a change, so that we may dismiss further speculation as to what Gleam might have been but for the prejudicial interference of length measurement.

If the official record of the Gleam has not been especially brilliant so far, it is owing to lack of opportunity more than to want of speed in the boat. Her debut in the A. Y. C. match of June 19, found her pitted against two rather unpretending cruisers, the Lois, of uncertain antiquity, and the Amazon, not known to racing fame. After an unsatisfactory day Gleam finished second, beating the Lois, but having to give in to Amazon, some 3ft. longer, by scant 8min. Her second test was in the Seawanhaka Corinthian race June 23, which turned out such a howling fluke as to be void of meaning, though Gleam proved lucky enough to lift the prize in the class. The third trial found her off with the Larchmont fleet in the annual open match sailed July 4. It was blowing a stiff breeze with a jump out in the Sound. Upon this occasion Gleam suffered a round defeat at the hands of two cruisers, the keel Varuna and Amazon, coming in a poor third, near 7m. astern of the second. Both her competitors were longer by several feet, and size will often make amends for poor model in blowy weather.

The impressions received upon the occasion were that Gleam's towering stick punished her severely, and that her beam caused her to swing as if on gimbles, while the sea stopped her at every bounce. It was noteworthy that in the same race, the Crocodile, another Ellsworth boat, suffered in like manner, and lost to Wave and Schemer, while she had shown herself more than a match for Wave in smooth water. During the remainder of the season Gleam got on a couple of local fights with ancient specimens, and sadly squandered them for their temerity, and likewise had one sail over, capturing the club championship in her class. Late in fall she got underway in company with the tidy little yawl rigged cruiser Aneto, of the deep draft keel persuasion and 21ft. loadline, in a two-reef snorter, and after a struggle Gleam retired discomfited and hugely surprised at the wholly unexpected issue. Gentlemen who witnessed this little surprise lay it to the load of spars Gleam had to whip, and to the antipathy of her beam for the sea there was running. To sum up, the Gleam, owing to reasons already mentioned, should be considered fast and close-winded in smooth water, but not a likely boat at all when brought down to more exacting work, which is the real test of merit. And this reputation holds good until the popular verdict can be shown to be mistaken.

As our plans will explain, Gleam is one of the few, very few, sloops entitled to the claim of being handsome. In her depth, high side and comparatively liberal displacement, and in the absence of flare can be traced commendable properties in accordance with the precepts ruling these columns. In her stunt body and great rig is seen the cloven foot of length measurement. This year Gleam is to try 1,500lbs. lead on the keel, which ought to make her display more mind of her own in lumpy water, though what effect it will have upon her footing of a summer's day is not so easy to foretell. If we do not care to hazard a prophesy, there are also no clear facts known why she should not benefit by the change at all times. Though the idea of "lugging" ballast outside instead of lovingly carrying it along in the hold is high treason according to persons who appear to have served their apprenticeship aboard the Ark, and though Mr. Lawton may forever fall from high grace with that school, there are those willing enough to give him credit for experimenting with a somewhat bold innovation, whatever the upshot may be.

Length over all	25ft. 10in.
Length on L.W.L.	23ft.
Beam on L.W.L.	9ft.
Beam extreme	9ft. 6in.
Depth, top of deck to keel	4ft. 9in.
Draft without board	3ft. 3in.
Least freeboard to plank sheer	1ft. 9in.
Displacement	11,000lbs.
Ballast inside	3,000lbs.
Ballast on keel	1,500lbs.
Area lower sail	788sq. ft.
Mast deck to hounds	29ft.
Boom over all	26ft.
Gaff over all	16ft.
Bowsprit outboard	15ft.
Topmast over all	16ft.
Hoist of mainsail	29ft.
Jib on luff	31ft.
Jib on foot	20ft.

The keel is of white oak, 8x8in. amidships, frames 3½x3 at heel, 3x2 at head, oak. Extra frame on bilge, 2x3, of hackmatack. Deck framing, 3x3 and 2x3, oak. Bed pieces for centerboard trunk, 7x4in., oak. Stem, post and rudder of oak, with locust stock. Plank, 1⅛ yellow pine, no butts above waterline. Deck stuff, 1¼ white pine, square, no butts. Trimmings, hatches and rail in mahogany. Cabin roof is of three layers thin boards, with canvas between. Sails of 10oz. duck, double bighted, also storm jib. Club topsail of 8oz. duck, single bighted, and spinnaker, balloon jib topsail of stout drilling. The bowsprit is a bright spar, run out nearly horizontal. Decks and interior of bright finish. The cockpit floor is 1ft. above waterline, and the centerboard trunk is kept low in the cabin, the top being "sealed" and caulked.

ANETO AND GLEAM.

Editor Forest and Stream:

Since the appearance of my letter in your last issue I have received a note from Mr. Lawton, from which I learn for the first time that he disagrees with me as to the result of the trial last fall, believing that the towing of a boat by the Gleam more than counterbalanced the disadvantage to the Aneto of lesser size and inferior rig for speed.

His letter exhibits much feeling, and satisfies me that the subject cannot be pursued with advantage to yachting interests. I accordingly withdraw my last letter to you in its entirety, and so retire from all discussion.

The Owner of the Yawl Aneto.

New York, March 31, 1884.

[It is strange that so much feeling should have been exhibited in this case, and other contracts from which the owner of the Gleam has withdrawn. The settled conviction of good judges is that the Gleam cannot be driven at high speed on account of her chubby form, and that the least chop completely breaks up her sailing. We make this statement in the interests of a proper appreciation of the question of design, as the personal prejudices of yacht owners are of no concern whatever to us. We should think every yacht owner would be glad to discover and admit the faults of his boat from an innate desire to further the truth. In the long run, this is bound to come out, and no super-sensitiveness or petty vanity of any individual can obscure or delay a correct estimate in the case. As a number of proposed trials with the Gleam have been lately rescinded, we desire to emphasize the fact that boats like the Gleam, however successful in light airs through the benefit of extravagant rigs, have generally collapsed in a breeze and sea.]

HULL Y. C.—Officers for the year: Commodore, Charles A. Perkins; Vice Commodore, W. B. Crane; Rear Commodore, D. Hall Rice; Secretary, Peleg Aborn; Assistant Secretary, Frank C. Brewer Treasurer, W. H. Litchfield; Regatta Committee, M. J. Kiley, P. M. Bond, J. A. Osgood, W. K. Millar, H. N. Curtis, F. M. Griffen, E. A Doe. The club voted to join the New England Yacht Racing Association, and elected as delegate Charles A. Perkins, and as alternate, D. Hall Rice. Membership, 437. Fleet includes 64 cats, 63 sloops, 24 schooners, 2 cutters, 1 yawl, 10 steamers—total, 164 vessels. Of these 75 are keels and 89 centerboards.

THE RIG OF RIGS.—The keel yachts Sunbeam, Mr. W. L. Wellman and Emily, Mr. A. McManus, are both to be be rigged as cutters, with new outfit of sails from McMannus & Son. The same loft will supply a complete rig to Mr. H. D. Burnhams new 115ft. schooner, building by Robert Palmer's Sons at Noank.

NEW CUTTER.—We hear that Mr. E. W. Syer, of Chicago, is having a smart ten-ton cutter built on the Thames, England, and will import her in time for the season. She will be a great addition to the Chicago fleet, and take for lake sailing, where a deep, able boat is much needed.

THE SEASON.—Attention is directed to yacht property offered for sale in another column. A fine semi-cutter can be purchased at a bargain, owing to departure of owner. She is a boat of three beams, quite new, and has an excellent reputation for strength and seaworthiness.

NEW YORK Y. C.—Has elected Mr. Edward E. Chase, schooner Clio, Vice-Commodore, in place of Mr. W. P. Douglass, resigned, owing to sickness. Also adopted protest and measures against the compulsory pilotage bill now pending before Congress.

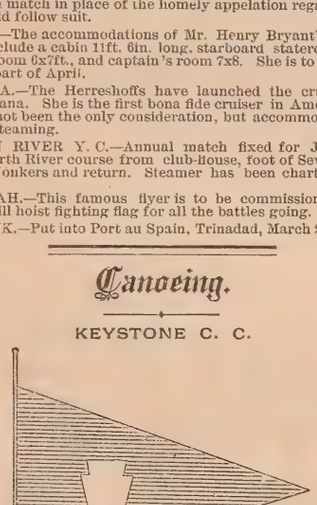
ILEEN.—This fine clipper cutter has returned from her Southern cruise, and will receive a general overhaul for the season. A gentleman who went out in the cabin, is to have a similar cutter built at once, though somewhat smaller.

CAROLINA Y. C.—Officers for the year: Commodore, C. H. Glidden, sloop Wildbird; Vice-Commodore, H. M. Tueller, sloop Flirt; Secretary, W. D. Porcher; Treasurer, W. W. Shackelford, Jr.; Measurer, W. Lawton Mikell.

MATCH OR REGATTA.—We note with pleasure that our esteemed but very slow contemporaries, are copying from us the introduction of the term match in place of the homely appelation regatta. Yacht clubs should follow suit.

THETIS.—The accommodations of Mr. Henry Bryant's new compromise include a cabin 11ft. 6in. long, starboard stateroom 12x8ft., port stateroom 6x7ft., and captain's room 7x8. She is to be launched the latter part of April.

MARIANA.—The Herreshoffs have launched the cruising steam yacht Mariana. She is the first bona fide cruiser in America. High speed has not been the only consideration, but accommodations and long time steaming.



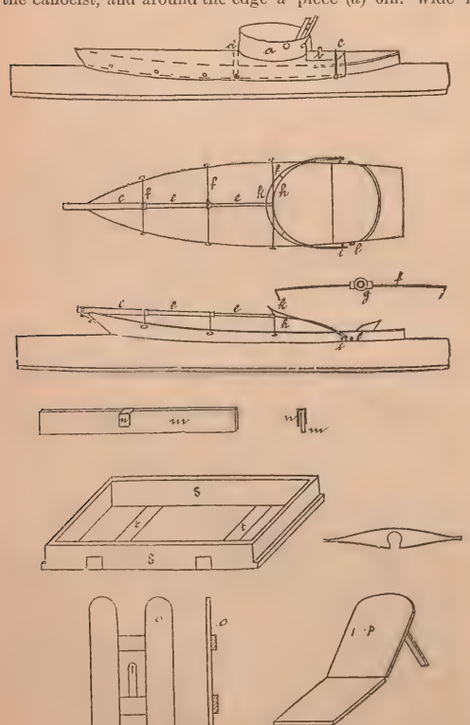
HUDSON RIVER Y. C.—Annual match fixed for June 11, over regular North River course from club-house, foot of Seventy-fourth street, to Yonkers and return. Steamer has been chartered for the spectators.

WENONAH.—This famous flyer is to be commissioned this season, and will hoist fighting flag for all the battles going.

MONTAUK.—Put into Port au Spain, Trinadad, March 25.

Canoeing.

KEYSTONE C. C.



KEYSTONE C. C., Philadelphia, Pa. Organized November, 1883. Captain, Woodward T. Norgrove. Signal, white keystone on blue field.

AMATEUR CANOE BUILDING.

Twelfth Paper.

APRONS.

IN rainy weather or in rough water it is necessary to cover the well entirely, either by hatches or by an apron fitting closely around the body. The simplest form of apron, and one especially adapted to the pointed coaming, is a cover of cloth, cut to the shape of the coaming and turned down on the edges, to button over screw heads in the latter, near the deck. It also extends aft about 6in. over the hatch or deck immediately behind the back. A hole is cut for the body of the canoeist, and around the edge a piece (*a*) 6in. wide is

stitched, so as to be drawn around the body. This piece is long enough to lap, as at (*b*), and button on one side. That portion of the apron abaft the body is held down by a cord (*c*) made fast to cleats or screweyes on deck, the apron not being buttoned to coaming abreast of the body.

A beam (*d*), to which the apron, just forward of the body, is nailed, keeps it arched so as to shed all water. If a forward hatch is used, the fore end of apron may be buttoned to it. In case of a capsize, the after part will pull from under the cord, and the canoeist is free, the apron remaining on the coaming. Instead of a buttonhole on the flap, a loop of light twine should be used, so as to break at once, if necessary.

Another device is the telescopic apron devised by Mr. Farnham, which consists of a wire framework covered with oiled cloth. This framework is composed of several brass or German silver tubes (*e*), one sliding in another, as in a telescope, and also of carlins (*f*) of ¼-in. spring brass wire, soldered or brazed, as shown, to collars (*g*) on the tubes. The ends of these carlins are turned, as shown, to engage under the beading on the outer edge of the coaming, and are also bent into loops to avoid cutting the cloth. On the after end a piece of $\frac{3}{16}$ wire (*h*), bent to a curve, is brazed, being also braced to the after carlin. This wire should extend 2in. aft of the sliding bulkhead to *i*. Forward of the well is a block screwed to the deck, and to it the first tube is pivoted by a universal joint, permitting a side motion to the framework, but holding it down forward, or it may be held by a strap, as shown. When the frame is drawn into position, the ends of the carlins, hooking under the beading, hold it down, and the curved ends of the piece (*h*) hook over blocks (*i*) on each side, keeping all in position.

The cover is of stout muslin, cut about 3in. larger each way than the coaming, so as to turn down, an elastic cord being run in the hem to draw it tight. Before sewing the cover to the frame, the ends of the carlins and all sharp corners or edges are covered with leather, so as to avoid cutting the cover. Extra strips are sewn on the lower side, under the carlins, to hold down the cover. For rough water an extra apron is used, being a short skirt, fitting under the arms, the lower edge gathered in by an elastic cord. An extra wire (*k*) is attached to the framework, forming a coaming on the after end of the apron, and a wooden coaming also runs across the after hatch. The lower edge of the skirt is drawn over these coamings, and also over two knobs (*l*) at the sides, the elastic holding all in place.

The apron on a Rob Roy or small canoe is sometimes held down by a strip of wood (*m*) on either side of the coaming, to which the apron is tacked, each strip having a flat brass hook (*n*) to hold it to the coaming, the forward end of apron being held down by a rubber cord passing around the fore end of well.

The material for an apron should be a stout muslin, and after being cut and sewed it should be stretched tightly, well dampened, and coated with a mixture of turpentine one part, boiled linseed oil three parts, and raw oil six parts, laid on very thin, a second coat being given when the first is perfectly dry. To complete the covering of the well, either with hatches or aprons, a waterproof coat is necessary, made in the form of a loose shirt, opening about 6in. in front, the sleeves being gathered in at the wrists with elastic. The coat is just long enough to touch the floor when *seated*, and it should have a flounce outside, just under the arms, and long enough to fasten over the coamings, or hinged pieces of the side flaps, if the latter are used, the coat being full enough to allow them to be opened inside of it. To put on the coat it is rolled into a ring, slipped quickly over the head, the arms thrust into the sleeves, after which it may be adjusted at leisure. Care should be taken in putting it on, as an upset while entangled in it would be serious.

A seat of some kind is necessary in a canoe; it should be as low as possible, in order to keep the weight down, but still high enough to be comfortable when paddling. In a boat of 11in. or more depth the crew must sit several inches above the bottom to paddle comfortably, and in such a boat a high seat allows the body to lean further to windward; but in a shoal boat all that is necessary is a small cushion on the floor boards.

The tent, clothes bag or blankets may serve as a seat, though it is better that all bedding should be stowed below deck and out of the reach of any moisture. Some canoes are fitted with a seat of pressed wood, such as is used for chair-seats, and in some cases the seat is simply a box without top or bottom, about 10in. square and 3in. deep, the top being covered with canvas, or leather straps.

A feature that is peculiar to the canoe, and that adds greatly to the comfort of the canoeist, is the backboard, usually a framework with two vertical strips joined by two crosspieces, as shown at *o*, and hung from the shifting bulkhead by a strap. The vertical pieces are 2½in. wide and ⅝ thick, slightly rounded on the fore side, and are placed 2¼ inches apart, thus supporting the back on either side of the backbone, and the crosspieces are rivetted to them. Sometimes a flat board, about 8x12in., is used, either with or without a cushion; but the frame is better. For paddling double, an extra beam is used across the cockpit, with a backboard hung on it for the forward man, or a seat is made of two pieces of board hinged together, one forming the back, being supported by a brace hinged to it (*p*). This back may be used at any point desired, being independent of the well and coaming, and the angle of the back may be changed at will, while it is easily folded and stowed away when not in use.

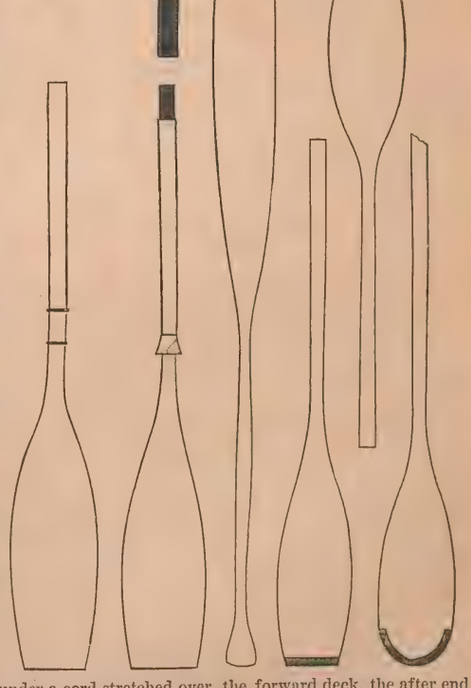
To increase the stowage room and to secure a better disposition of weights fore and aft, hatches are sometimes cut in the deck, but to be really valuable, two points are essential which have never yet been obtained; they must be quickly opened and closed, and airtight when closed. As good a method as any is to make a regular coaming to the opening in the deck ⅝ to 1in. high, the hatch fitting on to this coaming with a beading projecting down, two thumb screws being used to secure it. Its water-tight qualities may be improved by a square of rubber cloth laid over the opening before putting on the hatch. This hatch is heavy and clumsy in appearance compared with hatches flush with the deck, but the latter always leak, and are never to be relied on.

In some cases where it may be desirable to get at the inside of the compartments occasionally for repairs, a hatch may be cut in the deck and covered with a piece of ¼in. mahogany decking, 1in. larger each way than the opening, and fastened by brass screws as the deck is, the laps being first painted. This piece will be airtight and yet can be removed and replaced in a few minutes when repairs are needed.

For transporting the canoe on shore a yoke is necessary, and may be made in several ways, the simplest form being that used for the guides' boats in the Adirondacks, a piece of wood (*r*) hollowed to fit over the shoulders and around the neck, the boat, bottom up of course, resting with one gunwale on each end of the yoke. Another form is a box (*s*) with no top or bottom, long enough to fit in the width of the well, and having two straps (*t*) across one side, which rest on the shoulders; the coaming of the boat resting on the ends of the box.

A plan lately devised by Mr. Farnham employs a frame of four pieces, which also serves in place of a sliding bulkhead. When used as a yoke, two straps are buckled across it and support it on the shoulders, the boat being inverted on it.

PADDLES.



The principal point of difference between a canoe and other boats, is the mode of propulsion, the paddle being held and supported by both hands, while in boats the oar or scull is *supported* on the boat, and its motion is *directed* by the hand. The former is the primitive mode, and even to-day the craft used by savage tribes are propelled almost entirely by paddles, the oar being used by civilized nations

The shape of the paddle differs greatly in various localities, but two forms only are known to modern canoeists, the single blade, shown in the center of the accompanying plate, and the double blade, various forms of which are also shown. The former, derived from the North American Indians, is about 5½ft. long, with a blade 5in. wide, and is made of maple, beech, or spruce The upper end is fashioned so as to fit easily in the hand, the fingers being doubled over the top. The single paddle is used continuously on the same side of the boat, and its motion, in skilled hands, is noiseless.

The double paddle, the one best known in connection with modern canoes from the time of MacGregor, is derived directly from the Esquimau and his kayak. The length varies with the beam of the canoe, from 7 to 9ft., the former size being the one first used with the small canoes, but a gradual increase in length has been going on for some years, and of late many canoeists have adopted 9ft. instead of 8, as formerly, for boats of 30in. beam and over. Various patterns of paddles, as made by different builders, are shown in the plate, half of each paddle only being given. The blades vary in width from 6 to 7in., and in length from 18 to 20in.

Paddles of over 7ft. are usually cut in two and jointed, the joint consisting of two brass tubes, the larger one 5¼in. long and from $1\frac{6}{8}$ to $1\frac{7}{8}$ outside diameter; the smaller one 2¾in. long, and fitting tightly inside the former. The short piece is sometimes fitted with a small pin, fitting notches in the longer piece, so that when the paddle is set, either with both blades in the same plane, or if paddling against the wind, the blades at right angles, no further motion is permitted in the joint; but this plan is not advisable, as when the joint sticks, as it often will, it is necessary to turn the parts to loosen them, which of course the pin prevents.

Tips of sheet brass or copper are put on the ends to preserve them from injury against stones and logs in pushing off. Pine or spruce are the best materials for paddles of this style. To prevent the water dripping down on the hands, rubber washers are used, or two round rubber bands on each end, about 2in. apart, will answer the same purpose. One half of the double paddle is sometimes used as a single blade, an extra piece, similar to the head shown on the double blade, being inserted in the ferrule; or when sailing, one half, lengthened out by a handle 18in. long, may be carried on deck, ready for any emergency, the other half being stowed below. The half paddle, in this case, is held with the blade

under a cord stretched over the forward deck, the after end being held by a cord looped over a cleat abreast the body. For racing and light paddling, spoon blades are used, the general outline being the same as the straight blades, but the latter are stronger and better for cruising work.

CANOE vs. SNEAKBOX.

Editor Forest and Stream:

It would afford me much pleasure to enter into a friendly contest with Mr. Geo. H. Wild, and at the Newburgh meet, May 30, if we are favored with a breeze, I will gladly sail my canoe (15ft.x31in.) against his sneakbox, providing she is not more than 14ft.x4ft. The race to be 3 miles, over an equi-lateral triangle course. "Seneca," "Bojum" and Mr. Wild, all seem to have lost sight of the point of this canoe-sneakbox controversy. "Seneca," in FOREST AND STREAM, Feb. 14, made the assertion that "She will live in a gale of wind that the heaviest ballasted Pearl would not dare to face." It was this point to which I took exceptions in the Feb. 28 number. Nevertheless, as I have said above, I am ready to sail a race against the sneakbox, providing she is not a sloop.

CHAS. A. NEIDÉ.

SCHUYLERVILLE, N. Y., March 22.

THE CHART LOCKER.

VI. WINNIPESEOGEE AND MERRIMAC RIVERS.

W. H. N. asks how much water is likely to be found in these rivers by the middle of June, and whether there are any dams or rapids.

THE GALLEY FIRE.

CANOE AND CAMP COOKERY.

I.—OUTFIT.

FOR canoe cruising it is best to carry a sufficient outfit to cook a meal in a single box or chest, so that when one steps ashore for his dinner he can take in his hands all that is necessary, without continually running back and forth from canoe to camp-fire for materials, and if cooking inside the canoe with a canoe stove, the cover of the box can be opened wide and rested on the knees or some support to form a table, and everything is then convenient at the canoeist's hands. The box must be water-tight, and its size will, of course, vary with the room at the canoeist's disposal, the length of the voyage, proximity to points where supplies may be obtained, etc. I have seen very good chests of wood (Mr. Lucien Wulsin's is, I believe, of poplar), but I prefer one of japanned tin or galvanized sheet iron, as less likely to fracture.

Contained in the chest, in separate water-tight movable tins (japanned) are coffee, tea (or cocoa), sugar, flour (or meal), rice, baking powder, pepper and salt, the latter two in small spice boxes with two covers, the one underneath being perforated. Eggs are safest carried in the tins with the flour, coffee and rice; bread and bacon (or salt pork) are wrapped in macintosh and put near the top of the chest; the vinegar goes in a whisky flask (mark it to avoid mistakes), and canned goods, condensed milk, etc., in their own cans. The alcohol stove, if of the "pocket" variety, may go in the chest, and utensils absolutely necessary to cook a meal, such as coffee-pot, cup, forks, knives, spoon, handleless frying-pan, plates, etc.

The handiest thing about a cooking outfit, and the least in use, is a small pair of blacksmith's pliers. This instrument serves as a handle to the frying-pan and a lifter for everything on the fire, and can be always kept cool. A frying-pan made of a deep tin plate is as serviceable as any, except when broiling or baking in the frying-pan is to be done, then a regular iron one with a cover has to be used. A three-quart pail is necessary for stews, and two others may be nested in it, one of two-quart and the other of three-pint capacity. These and the cups should be of granite ware.

Outside of the chest are kept two tin basins (for baking bread, as per recipe in FOREST AND STREAM for March 8), a jug of molasses, and butter in an earthen jar having a water-tight cover, so that it may be enveloped in a net and sunk to the bottom of the stream.

A really first rate canoe stove has yet to be invented. I have never used the *flamme forcé*, but should think it would be an improvement on many I have tried, among others the Rob Roy. I generally carry two alcohol stoves of small size. Mr. Danforth, the fluid man, as I learned from his agent to-day, expects to perfect something this summer that he considers will fill the bill, be cheap, very portable, and lacking in disagreeable odor. I will announce results after I have tried it.

Now as to grub in general, besides what I have already mentioned, condensed milk is a good thing, but condensed coffee, condensed eggs and condensed beef are abominations. Flour should be of the self-raising kind, Indian meal is very nutritious and easily made up, as it requires nothing to lighten it; scald it before using when it is not fresh. Canned tomatoes, corn, fruits, beans, soups, salmon, etc., are easy to prepare, and vary the monotony of regular camp fare.

The Brunswick goods are excellent, and they make a prepared food called "Brunswick clam fritters," each tin containing material for a dozen fritters, with ingredients and seasoning complete, which can be prepared for eating in five minutes. I never had much success with Warren's "evaporated vegetables for soup," though household cooks use them considerably, I believe. All canned goods have printed directions on the cans. Dried beef, corned beef, lemons and sardines make good additions to the outfit. Potatoes, onions, and other vegetables, if possible, should be procured en route as needed.

The above outfit is only intended for a solitary cruiser like myself. Where there is a large camping party the utensils will have to be, of course, more numerous and of larger size, and an iron pot and Dutch oven should be added. Nothing should be left to stand in an iron pot after it is cooked, or it will become discolored and have an unpleasant taste. If knives become rusty, rub them with a fresh cut potatoe dipped in ashes. SENECA.

CLUB NOTES.—The Deseronto C. C., of Deseronto, Ontario, Can., was organized on March 17, 1884, with F. S. Rathbun, Captain; Geo. Clinton, Mate; E. C. French, Purser.——The Hartford C. C. have sent us a neatly printed copy of their constitution and by-laws.

LANSINGBURG CANOES.—The shop of Mr. C. W. Smith, the builder of these canoes, was burned down on Thursday last. Several boats, with all models, tools and stock being destroyed.

Answers to Correspondents.

H. T. O., Cleveland, O.—There is no such breed.

C. W. C., Essex, Mass.—We expect to publish the sketch shortly.

C. L., Leadville, Col.—Write to Mr. William Loeffler, Preston, Minn.

W. B. P., New York.—Your dog is not what is called a pure Llewellin.

M. M., Girard Manor, Pa.—Flushing signifies starting the bird, retrieving means fetching.

R. B. G., Leavenworth, Kan.—Perhaps if you would advertise your dogs you could find a customer.

WM. M. R., Jacksonville, Fla.—We cannot recommend any particular builder or model. Would advise a boat 14x30 with standing lugs instead of leg of mutton.

D. A. G., Newburyport, Mass.—The Gordon setter bitch Nell, imported by Mr. T. H. Scott, was said to be by Rupert (Shot—Rhona) and out of Rhona (Reuben—Nell).

D. H. S., Rushford.—The correction has been made. The dram by which powder is measured is an arbitrary measure, not a weight. You should measure the powder, not weigh it.

J. G., Metamora, Ind.—I want to get my gun rechoked. Is J. Dannenfelser, No. 9 Chambers street, reliable? Ans. Perfectly so, we believe. He will do it as cheaply for you as any one.

E. C. C., Munising, Mich.—Kindly send me the address of T. S. Van Dyke, one of your writers on "The Choice of Hunting Rifles"; would like to correspond with him. Ans. T. S. Van Dyke, San Diego, Cal.

J. A. O., Boston, Mass.—We know of no sure remedy to prevent your dog from running away. Perhaps if you can induce the friends that he visits to whip him home a few times it may have the desired result.

E. M. S., Dundee, Yates County, N. Y.—I have just finished reading the article on "Amateur Photography" in the last number of your paper, and being desirous of purchasing an outfit, wish to profit by the experience of others so as to obtain the best. Please inform me in regard to the choice of outfits; book of instruction, and such other information as I need. Ans. Would advise your getting a medium sized camera, say with a plate 5x8 inches. You can obtain them of E. & H. T. Anthony & Co., 591 Broadway, or of W. T. Gregg, 77 Fulton street. The outfit can be sent by express. We can furnish the book of instructions, "How to Make Photographs," paper, 50 cents; cloth, 75 cents.

O. B. A., New York.—In your list of open seasons you say "Vermont, bass, pickerel and pike, May 1 to Jan. 1. Does this apply also to brook trout? Ans. The trout season in Vermont opens May 1 and closes Sept. 1.

C. F. N., Syracuse, N. Y.—1. Blue belton is a term used to describe a color which has a ground work of white that is ticked with black. 2. The "Dogs of the British Islands," by Stonehenge, will give you information about the different breeds. We can furnish it, price $7.50.

BOB WHITE, Brooklyn, N. Y.—1. Some breeders feed puppies boiled milk, others give it in its natural state; we have invariably had good success with the latter method. 2. "The dogs of the British Islands." 3. Both are good. 4. Yes. 5. Yes. 6. "The American Angler's Book," by Thad. Norris, price $5 50, will serve both purposes. "Fishing in American Waters," by Genio C. Scott, price $3.50, is also good.

F. E. M., Jerome, A. T.—1. Will you be kind enough to tell me at what season of the year the speckled trout of New York and vicinity spawn? 2. Also the close season? 3. Are there any fish that spawn in the autumn? Ans. 1. From November to March. 2. Sept. 1 to April 1. 3 There is not a month in the year but finds some species of fish spawning. Most of the salmon family spawn in the autumn.

H. B., Holton, Kansas.—1. I had a 12-bore shotgun, J. P. Clabrogh & Bros., but sold it, and now want to buy a 10-bore, at what distance should a 10-bore kill a duck with 4½drs. powder and 1¼oz. shot? 2. Is the Parker as good a gun as there is made, is there any better for shooting qualities and strength? Ans. 1. You should be able to rely on it, if held straight, up to 45 or 50 yards. 2. Yes.

G. W. W., Serana, N. Y.—1. Please inform me where the gummed wads described by "Falcon," in FOREST AND STREAM of March 6, can be obtained. I should like to try some of them, but have never seen any in the market accessible to me. 2. Will you give me some idea of what a paddle should be (single blade)? I am using an open canoe made by Waters, of Troy, N. Y. It holds two persons comfortably, and is fitted with outriggers and oars. I want to make a paddle for all around work on Lake Cayuga. Ans. 1. The gummed wads described by "Falcon" are not yet on the market. When ready they will be advertised. 2. See "Canoeing" on another page.

A STRONG INDORSEMENT.—The following letter explains itself: Boston, March 14.—Massachusetts Arms Company, Chicopee Falls, Mass.: The Maynard rifle with its new barrels was duly received. I wish to thank you for the very prompt and careful manner in which you have filled my order. I purchased a Maynard rifle some years ago, but with a desire which, I presume, all lovers of the rifle experience, to possess the most accurate weapon. I purchased nearly every variety of rifles made in this country and some of English make. All I have ever owned I have shot at target, and most of them on game. I have endeavored to ascertain the true merits of each gun, and after experimenting a number of years I am now fully satisfied that the one that suits me best is the old reliable Maynard. In choosing a rifle I first look for accuracy, and I am certain that none surpass the Maynard. For convenience I have never seen its equal. I have carried mine in my trunk with barrels of different caliber on many business as well as pleasure trips. I am prepared for target or game shooting, and so high an opinion have I of this gun, that I have disposed of all of my other rifles, retaining only my Maynard.—A. C. GOULD.

ABBEY & IMBRIE,

Manufacturers of Fine Fishing Tackle

48 and 50 Maiden Lane, New York City.

We beg to call attention to our new 120-page folio Illustrated Catalogue. We have spared neither labor nor expense in our effort to make this the most complete work of its kind. We will send a copy, postpaid, on receipt of 50 cents, which price does not nearly reimburse us for its cost.

FOREST AND STREAM: "The list is surprising, even to one familiar with such matters. The great merit of this catalogue is its accuracy."

AMERICAN ANGLER: "It is, without doubt, one of the most complete and elaborately illustrated catalogues that has ever been issued in the interest of a private firm. This catalogue may be classed as a *text book*, owing to its practical value to the general angler."

NEW YORK EVENING POST: "The amount of ingenuity exercised in devising means to capture fish becomes apparent only upon study of such a catalogue of fishing tackle as Abbey & Imbrie, of New York, have just published."

SCIENTIFIC AMERICAN: "The book has 92 large plates, covering almost every conceivable appliance in this line, and in such profusion of styles as would probably delight even our most expert of fishermen, President Arthur."

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin phable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

101 & 103 Duane Street, New York.

AT THE LONDON FISHERIES EXHIBITION

THE NICHOLS

Hexagonal Split Bamboo Fishing Rods

Were awarded **Three Silver Medals** and the highest special prize—**10 Sovereigns.** Noted for excellence more than numbers. This is the highest prize awarded to any American for Split Bamboo Rods.

Antelope and Deer of America.

—BY—

JOHN DEAN CATON, LL.D.

This work is the most important publication ever printed on the subject.

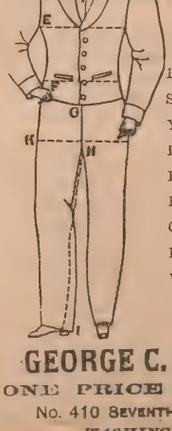
The subject is a capital one. These animals are the most interesting of all our American game.

It takes a deer hunter to write of deer; and he must bring to the work the same enthusiasm that prompts him to carry the rifle day in and day out in pursuit of the game. There is no need of Judge Caton's telling us in the preface that deer hunting has always been his favorite diversion, for the reading of his book shows us that.

The characteristic of the book is that it is, all the way through, a statement of facts which have been learned by the most patient and industrious study of these animals. Judge Caton has for many years kept in domestication the American antelope and all of the American deer, save the moose and the two species of the caribou. The chapters are devoted to the following: The Antelope, Moose, Elk, Woodland Caribou, Reindeer, Mule Deer, Columbia Black-tailed Deer, Virginia Deer, Barren-ground Caribou, Reindeer, Acapulco Deer.

"The Antelope and Deer of America" is a large volume of 426 pages, illustrated with more than fifty illustrations (most of them from photographs), bound in cloth. The former publishers sold the book for $4.00.

We have reduced the price from $4 to $2.50.



Forest and Stream Publishing Co., 39 Park Row, New York.

☞ NOW READY, The Finest Cigarette,

Twelve First Prize Medals, Sweet, Delicate and Mild. "CLOTH OF GOLD," (STRAIGHT MESH.)

ANSWERS TO CORRESPONDENTS.

THE FUTURE OF THE PARK.

THE Yellowstone National Park seems now in a fair way to be properly administered. The Improvement Company has been from the first a terrible bugbear—the ogre which threatened, at one gulp, to swallow our National pleasure ground. But for the prompt and energetic action of Senator Vest, it might well have irretrievably damaged this beautiful spot. For the present this corporation appears to be fully occupied in striving to find a way out of its own difficulties. A flood of light has been thrown upon it and its doings, which has shown the people very clearly what the methods and intentions of its projectors were. Its hands are tied. Like the bad giants of our childhood's stories, it is at last defeated and crushed. From this danger, which was the most imminent of those that threatened, the Park has been saved.

The state of things now is not very unlike what existed a few years ago. There is a difference, however. At that time, probably not one man in a thousand knew that such a reservation as the National Park existed. Now very few are ignorant of this existence, and almost every one takes an interest, more or less active, in the preservation from destruction of this grand region, in which each citizen should feel that he has a personal ownership.

The Senate has passed a good bill for the proper protection and care of the National Park, and this bill is now in the hands of a committee of the House of Representatives. Senator Vest has appeared before this committee, and has fully explained the character and bearings of the proposed law, and it seems likely that it may be favorably reported.

But when? What prospect is there, in the war of factions which is ever raging in Washington, that a bill, in which there is neither money nor politics, a bill merely for the good of the whole country, will be pressed to a vote before the session closes? It would seem, to one unacquainted with the strangely dilatory methods of American legislation, that it might be an easy matter to carry so important a measure as Mr. Vest's bill, but we are not over-sanguine that this will be the case.

We earnestly hope that the measure will become a law. On many accounts it is of the highest importance that it should pass. Any delay in enlarging the boundaries of the Park will be most unfortunate. The longer this action is postponed, the more difficult it will be to bring it about. Lands taken up on the borders of the Park will be difficult to acquire, and will be held at fancy prices by those who have entered them for settlement.

But what was needed even more than a law on the subject, has been accomplished. The people have been aroused to the importance of preserving the Park, and they have spoken on this subject in tones that are unmistakable. They demand that this Park shall be cared for, and that they and their children's children may have the opportunity to see here for all time what our country was before it had been touched by the hand of civilization; what its fauna and flora were before ruthless butchery had exterminated the one, and importations of species from foreign localities had confused the other.

The number of those interested in the Park is constantly increasing. As more and more intelligent people visit the region there will be constant accessions to this number. We must remember that if the Park is to be guarded as we wish to have it, a constant effort must be made. Influence must be brought to bear on all our legislators; the importance of the Park and its proper care must be insisted upon; the subject must be talked up with neighbors and friends, and they must be interested; there must be no relaxing of our efforts. The matter is not one which interests the professed politician. He does not care for it. To him there is nothing "practical" in it. He even sneers at it as a matter of sentiment. Let him call it so if he will. There is need of a little sentiment in the American life of the day.

Whatever it is, let us continue to work for the accomplishment of the good end we have in view. A good beginning has been made, but it will not do to rest now. Each of us has a duty to perform. And on the faithful performance of that duty hangs the future of the Park.

The proposition to utilize this reservation, or a part of it, as a zoological garden is one which may come up a few years hence with better prospects than it can now have. At this time people are considerably exercised as to how the reservation is to be cared for, and they will have enough to do to see this work properly carried out. It will be a mistake to have the energies which ought to be wholly devoted to one matter, divided and spread out over several. If the efforts of all the friends of the Park are concentrated on its enlargement and proper care, we may hope that before long these efforts will be crowned with success. After we have accomplished this most important work, other minor matters can receive attention, but just now let us waste none of our energy on side shows.

A GUN LICENSE BILL.

ON Tuesday last, a bill introduced by Mr. Moore passed the New York Assembly. Its provisions forbid the shooting of quail or small birds on Staten Island by non residents except on payment of a license fee of $10. This license fee entitles the person paying it to shoot for one year. The bill appeared to meet the general approval of the house, and only sixteen votes were cast against it.

We cannot but regard this measure as an excellent one. By far the greater number of those who go to Staten Island to shoot are of a class very undesirable as visitors to any community. The objects of their pursuit are song birds, and to their thirst for the sparrow's gore they sometimes unite a ruffianly conduct that makes them extremely unpopular with the Staten Islanders. Too often they tear down fences, kill chickens, and alarm the families of the residents. These are the men who make the name of sportsman odious to the farmer, and they should be promptly dealt with.

There is another reason for limiting by every legal means the shooting on Staten Island. Within the last two years a considerable number of quail have been turned out there, and with reasonable protection may do well, but if they are exposed to the attacks of every Bowery gunner who spends his Sunday in tramping over the Island with hired gun and borrowed dog, they certainly cannot last long.

This gun license law has often been spoken of as something that must finally be adopted in America if the game is to be saved from extinction, and it has generally been thought that it would be very unpopular. It will not be long, however, before even the most thoughtless of sportsmen will have to ask himself, "What is to be done to save the game?" Clearly, there is no hope in the self-restraint of those who pursue it, and who are most interested in its preservation, although it might be imagined that this would be the first remedy thought of.

A PITIFUL STORY.

ONE of the saddest features of the collapse of that miserable fiasco, the National Park Improvement Company, is the manner in which this corporation has treated the mechanics in its employ. For eight months prior to March last these mechanics have not received one cent of pay, and their condition at the present time is truly deplorable. It is stated that they are absolutely in need of clothing, that they are without shoes, and this in a climate which is almost Arctic in its severity, the elevation of the Mammoth Hot Springs above the sea level being over six thousand feet, or about that of Mount Washington.

We have recently had an opportunity of perusing a letter written by one of the employes of this company, in which the sad condition of himself and his fellows is described, and the story told in it was very touching in its rugged simplicity.

In their desperation, the men have seized the hotel and intend to hold it, as in some sort a security for what is due them. We fear that this will scarcely help them much, though they may be able to give the Improvement Company so much trouble that they will pay them off to get rid of them. We do not know enough of Territorial law to recommend a course to these unfortunate men, but in older countries they could file a mechanic's lien on this ridiculous summer hotel, which would fully protect their rights. Cannot this be done in the present case?

We have a very sincere sympathy for these poor men. It would be hard to find a more striking illustration of the cant saying that corporations are soulless than is the present case.

IT IS BELIEVED that "Woodcraft" will be ready for delivery to an anxious public by the first of next week at latest. The sheets are now running through the press, and before the first reader of FOREST AND STREAM sees these lines a lot of them will be delivered to the binder. There have been some delays in certain parts of the manufacture of the book, which have kept the volume back a little, but in a very few days all the orders will be filled. The advance demand for the book has already been so large that we have been obliged to increase our order for the original edition one-half, and if the orders continue to come in at the same rate we shall have to double it. Every man who intends to spend a little time in the woods this summer or fall, will want a copy of "Woodcraft," and as the number who annually spend their vacations in camp is very large, we anticipate for the book a sale quite beyond that of any book of the kind which has ever been published. In our advertising columns will be found some information about the work.

THE NUMBER OF DOGS entered in the April number of the *American Kennel Register* is 105, making the whole number entered in the first thirteen issues of the monthly, 1,115. Certainly this is a remarkable showing, and the fact indicates far better than any long-winded argument could, just how much need there was of such a register. Something was required which should be reliable, prompt and up to the times, for it does a man little good to register his dog and not have the registry number published until after the animal is dead. The success of the *Register* is a matter for congratulation to all dog breeders.

THE ACCOUNT given in another column of a Norwalk man who killed at a single shot 27 or 28 broadbills, or 50 old squaws, will startle some of our readers. Before condemning the act let each man examine himself and discover whether he would have refused to take such a shot himself, had the opportunity offered. He that is without sin among us let him cast the first stone. At the same time, we cannot help thinking that if the shooter had used a hundred shots to kill his fifty birds he would have had a great deal more fun out of his shooting.

THE PRESSURE upon our space in all departments, but particularly, for the last few weeks, in our kennel columns, obliges us to hold over a great number of most interesting articles on various topics. We hope that our contributors will understand that their articles are only delayed through circumstances quite beyond our control.

THE PRESENT SEASON has been remarkable for the number and excellence of the dog shows which have taken place. Three only remain to be held, St. Louis, New York and Chicago, the latter some time late in May or early in June.

The Sportsman Tourist.

SPENCE PITCHER'S BEAR.

IT was away back in the days of flintlocks. At that time the northern border of Cattaraugus and Chautauqua counties was mostly a wilderness, with only here and there small openings, which were made in the heavy timbered forest by the early pioneer settlers. This section of country is somewhat rough and broken, although not very mountainous, and was at that early day as well, or perhaps better, stocked with game than any other portion of the State. Here were wolves, wildcats, foxes, raccoons, bears and deer; also marten, which were found in great numbers all through the southern part of the State, as well as in Pennsylvania, and were eagerly hunted and trapped for their skins, which were always a ready sale, and were among the most choice specimens of fine furs that were then being collected in the Northern and Middle States. Those beautiful little animals have become nearly extinct. Perhaps a few may yet be found in the northeastern part of New York or in Northern Michigan. There was one other species of game that deserves mention. This was the panther; but it soon fled beyond the pale of civilization. It was rarely seen and more rarely caught. In every new settlement there were plenty of imaginative individuals who were ever hearing panther screams, and who verily believed that panthers never traveled through the forest without making night hideous with terrific yells and screeching. If there had been no owls there would have been a less number of panthers heard from. I have tramped and camped in the woods more or less for more than fifty years, and I must confess that my ears were never greeted with a single yell or scream from a panther.

The first settlers of this region were men who had energy and perseverance, some of whom immigrated from Rhode Island, and others from the Mohawk Valley. There were but few skilled hunters among them, and their guns were of the coarsest kind—mostly of the old musket pattern. Deer were plenty, however, and they could generally obtain a supply of venison when other supplies failed. It was sometimes obtained by crust-hunting in the month of February or March, when any unprincipled wretch could succeed in killing deer.

I always noticed that the most indefatigable crust-hunters were those that never used a gun, but with knife and axe followed up the dogs until the deer was pulled down. I have been disgusted at the sight of the many fresh (and worthless) deer skins which I have seen hanging around some of the settlers' cabins in the months of February and March.

Bears were frequently caught in traps or log pens, and some were followed up with dogs and shot. I remember of one being caught in a somewhat singular manner, which I believe never had a precedent.

Spencer Pitcher was a noted hunter, who came with the first settlers, and was known far and near only by the name Spence. He was five feet eight inches high and weighed 170 pounds; his speed and endurance were remarkable, and perhaps he seldom, if ever, found his equal. Now the majority of the inhabitants worked most of the time and hunted occasionally, but Spence hunted most of the time and worked occasionally. He was hunting deer one rainy day about the first of November, when he discovered a bear, but his gun missed fire. Ordinarily his flintlock was sure-fire, but the rain had wet the charge, and by the time he found that his gun had become useless the bear had begun to make off. Now a bear when started will almost invariably run up hill; where he has a decided advantage over his pursuer if he has the chance; but as they were then on the summit of a hill, there was no other course open but down hill. So the bear started on a full run, and Spence was close a this heels. There was some three inches of snow, and the continued rain had made it slippery and slushy, and some fallen timber lay in the way, but the bear made good time and Spence kept well up in the rear. At every attempt which he made to crush in the bear's cranium with the muzzle end of his rifle, it would just seem to slip about half a length ahead, and every time he struck it lessened his own speed, so that he had to put in his best to catch up again.

They soon struck level land where the woods were clear of logs and brush. Here they both settled down into a dead run. The bear was rather lean and in good trim for running, and Spence for once had met his match, and so had the bear. The flat extended for a half mile, the course leading toward another hill, at the foot of which runs a small brook. Spence knew very well that when the bear reached the foot of the hill he would soon be left far in the rear, and what he was going to do toward capturing the bear he probably did not know himself, unless he could provoke the bear to turn upon him, in which case we would suppose that the chances would have been more than two to one against him. The small stream before mentioned had a bank five or six feet high on one side, while the opposite side was flat and covered with sand and gravel. Up to this bank they came at a 2:40 gait; the bear plunged down the bank into the water, while Spence, dropping his gun, leaped over the bear, landing on the gravel some ten feet beyond. Here he snatched up a round stone which happened to lie within his reach, and whirling around, threw it at the bear's head, which was not more than six feet distant. The stone struck the end of his nose, probably the most vulnerable part of the animal, when the bear suddenly turned around, dropped his head between his forelegs, and as quick as thought Spence grabbed him by the long wooly hair on each flank, which caused a sudden flank movement that brought them both into the middle of the stream, here about two feet deep. Bruin was caught at a disadvantage, he had a heavy incumbrance tugging at his hindquarters. He tried hard to turn on his captor, he tried to wring out and tried to kick out, but it was no go, Spence hung to him with the tenacity of a forty-pound steel trap.

His success depended wholly on his active muscular power, in keeping the bear's rear end well raised up, which brought his head under water. Then by a mighty effort he succeeded in forcing his head under the edge of the opposite bank, where he held on (as he said) until the bear kicked his last kick. He always asserted that if they had crossed the stream at any other place, that he would have been unable to have overleaped the bear, and if that round stone had not laid precisely where it did lay, he could not have stopped him.

Spence lived to hunt with pill-percussion priming, also until percussion caps were used, and died when about sixty years of age, long before breechloaders came into use.

The region before mentioned is now mostly covered with valuable farms, and wonderfully adapted to dairy and stock raising, and is occupied by the third and fourth generation, who know about as much concerning the first settlers as they do about the Esquimaux or New Zealanders. Now the thrifty farmer gathers his hay and grain into barns, which groan under the burden of plenty, and thinks not, nor knows not, of the privations, toils and hardships endured by the pioneers who first cleared the way and virtually laid the foundation to the present thrift and prosperity of the country. It is not a question with the farmer of to-day whether he will be able to eke out his scanty supplies until next potato harvest, but rather a question whether he will be able to clear as much clean cash from his farm produce as his next neighbor. ANTLER.

GRANDVIEW, Tenn., March 4, 1884.

DEAR SHOOTING.

SEVERAL years ago there lived in Illinois two families by the names of Crickley and Drake. There had always been a fierce rivalry between the two families, both in field and farm pursuits, which rivalry was further intensified when one afternoon Colonel Crickley, having followed a wounded buck for several hours, at last came up with him, and found old Drake and his sons cutting him up. This incident added fuel to the fire, and from that time there was nothing the two families did not do to annoy each other. They shot each other's ducks in the river, purposely mistaking them for wild ones, and then by way of retaliation, commenced killing off each other's pigs and calves.

One evening Mr. Drake, the elder, was returning home with his "pocket full of rocks" from Chicago, whither he had been to dispose of a load of grain. Sam Marston was with him on the wagon, and as they approached the grove which intervened between them and Colonel Crickley's house, he observed to his companion:

"What a beautiful mark Colonel Crickley's old Roan is, over yonder!"

"Hang it!" muttered old Drake, "so it is."

The horse was standing under some trees about twelve rods from the road. Involuntarily Drake stopped his team. He glanced furtively around, then with a queer smile the old hunter took up his rifle from the bottom of his wagon, and raising it to his shoulder, drew a sight on the Colonel's horse.

"Beautiful!" muttered Drake, lowering his rifle with the air of a man resisting a powerful temptation; "I could drop old Roan so easy."

"Shoot!" suggested Sam Marston, who loved fun in any shape.

"No, no; 'twouldn't do," said the old hunter, glancing cautiously around him.

"I won't tell," said Sam.

"Wal, I won't shoot this time, anyway, tell or no tell. The horse is too nigh. If he was fifty rods off, instead of twelve, so there'd be a bare possibility of mistaking him for a deer, I'd let fly. As it is, I'd give the Colonel five dollars for a shot."

At that moment the Colonel himself stepped from behind a big oak, not half a dozen paces distant, and stood before Mr. Drake.

"Well, why don't you shoot?"

The old man stammered in some confusion, "That you, Colonel? I—I was tempted to, I declare! And, as I said, I'll give you a 'V' for one pull."

"Say an 'X' and it's a bargain."

Drake felt of his rifle, and looked at old Roan.

"How much is the horse wuth?" he muttered in Sam's ear.

"About fifty."

"Gad, Colonel, I'll do it. Here's your 'X.'"

The Colonel pocketed the money, muttering, "Hanged if I thought you'd take me up."

With high glee the old hunter put a fresh cap on his rifle, stood up in his wagon, and drew a close sight on old Roan. Sam Marston chuckled. The Colonel put his hand before his face and chuckled, too.

Crack went the rifle. The hunter tore out a horrid oath, which I will not repeat. Sam was astonished. The Colonel laughed. Old Roan never stirred.

Drake stared at his rifle with a face as black as Othello's.

"What's the matter with you, hey? Fus' time you ever served me quite such a trick, I swan."

And Drake loaded the piece with great wrath and indignation.

"People say you've lost your knack o' shooting," observed the Colonel, in a tone of cutting satire.

"Who said so? It's a lie!" thundered Drake. "I can shoot—"

"A horse at ten rods, ha, ha!"

Drake was livid.

"Look here, Colonel, I can't stand that," he began.

"Never mind, the horse can," sneered the Colonel; "I'll risk you."

Grinding his teeth, Drake produced another ten-dollar bill.

"Here," he growled, "I am bound to have another shot, anyway."

"Crack away," cried the Colonel, pocketing the note.

Drake did crack away—with deadly aim, too—but the horse did not mind the bullet in the least. To the rage and unutterable astonishment of the hunter, old Roan looked him right in the face, as if he rather liked the fun.

"Drake," cried Sam, "you're drunk! A horse at a dozen rods, oh, my eye!"

"Just you shut your mouth or I'll shoot you," thundered the excited Drake. "The bullet was hollow, I'll swear. The man lies who says I can't shoot! Last week I cut off a goose's head at fifty rods, and kin dew it agin. By the Lord Harry, Colonel, you can laugh, but I'll bet now, thirty dollars, I can bring down old Roan at one shot."

The wager was readily accepted. The stakes were placed in Sam's hands. Elated with the idea of winning back his two tens, and making an "X" into the bargain, Drake carefully selected a perfect ball, and even buckskin patch, and beaded his rifle. It was now nearly dark, but the old hunter boasted of being able to shoot a bat on the wing by starlight, and without hesitation drew a clear sight on old Roan's head.

A minute later, Drake was driving through the grove, the most enraged, the most desperate of men. His rifle, innocent victim of his ire, lay with broken stock on the bottom of his wagon. Sam Marston was too frightened to laugh. Meanwhile, the gratified Colonel was rolling on the ground convulsed with mirth, and old Roan was standing undisturbed under the trees.

When Drake reached home, his two sons discovering his ill humor, and the mutilated condition of the rifle stock, hastened to arouse his spirits with a piece of news, which they were sure would make him dance for joy.

"Clear away," growled the angry old man. "I don't want to hear any news; get away, or I shall knock one of you down."

"But, father, it's such a trick."

"Blast you and your tricks."

"Played off on the Colonel."

"On the Colonel?" cried the old man, beginning to be interested. "Gad, if you've played the Colonel a trick, les' hear it."

"Well, father, Jed and I, this afternoon, went out for deer—"

"Hang the deer, come to the trick."

"Couldn't find any deer, but thought we must shoot something; so Jed banged away at the Colonel's Roan, shot him dead!"

"Shot old Roan!" thundered the hunter. "By the Lord Harry, Jed, did you shoot the Colonel's horse?"

"I didn't do anything else."

"Devil, devil!" groaned the hunter.

"And then," pursued Jed, confident the joke part of the story would please his father, "Jim and I propped the horse up, and tied his head back with a cord, and left him standing under the trees exactly as if he was alive. Ha! ha! Fancy the Colonel going to catch him. Ho! ho! ho! wasn't it a joke?"

Old Drake's head fell upon his breast. He felt of his empty pocket-book, and looked at his broken rifle. Then in a rueful tone, he whispered to the boys:

"It is a joke, but if you ever tell of it, or if you do, Sam Marston, I'll skin you alive. By Lord Harry, boys, I've been shooting at that dead horse half an hour at ten dollars a shot."

At that moment Sam fell into a gutter. Jed dragged him out insensible. Sam had laughed himself almost to death. H. H.

THE FROG CATCHER.

LITTLE Jean Beghin was born in Belgium and learned the business of catching frogs in the Netherland marshes, but having an ambition above the capture of batrachians had enlisted in the Belgian army. But the light pay and lighter rations of the Leopolds tempted little Jean to desert and tender his services to Napoleon III., not as a purveyor of *grenouilles* for the imperial table, but to become an imitator of Cortez in the conquest of Mexico. But the conquest of Mexico has wrecked the hopes of many a Johnny Crapeau, and our little Jean deserted from the French army in Mexico and sought the liberty of the Stars and Stripes. Such are the vicissitudes of military life. Nothing succeeds but success. Now, and for the last four years, we find little Jean at Arivaca, Pima county, in the southwestern part of Arizona, catching frogs.

The valley is about six miles long by three miles wide, and the *cienega* contains enough frogs to feed the French nation. Little Jean wears India rubber boots, and has made nets, held open by old barrel hoops, which he spreads for the lively frogs to jump into for some vegetables and the sight of red flannel, when up goes the sweep, and little Jean is rewarded with six or ten dozen frogs per net. He then empties the net into a bag, and the bag into barrels, where there is some water and vegetable matter; but the barrel is so high that the frogs cannot jump out. The frog is a great jumper, and Jean has some trained frogs here which can jump from seven to ten feet. He will wager money against any jumping frogs this side of Calaveras county, California.

Jean thinks the frogs breed twice or more a year from eggs deposited in the sac of the female, and estimates the number of each spawn at from fifty to a hundred. As frogs have an amazing longevity there is no danger of the supply being reduced, and the increasing taste for frog suppers is bringing this batrachian into large demand. I can remember when frogs were scarcely considered proper food in America, when the country was overflowing with an abundance of meat quite as delicate as chicken. The French and Chinese have far outstripped us in searching out the bounties of nature for human food.

But to return to the frog catcher who, instead of wearing the decoration of the *legion d'honneur* and a home in *les Invalides* must earn his living by chasing the lively frog, and very poor pay he gets for it, too. Only 50 cents a dozen on the place and 60 cents per dozen in Tucson, sixty miles distant. Jean's frogs go about four or five to the pound, and are esteemed the best in Arizona, as the desert is not famous for producing frogs.

I have endeavored to stimulate Jean's ambition by advising him to go into the canning business, by canning live frogs in the summer time for a winter market, in fact, have told him that frogs would live a thousand years in a hermetically sealed can, and then come out jumping. That may be a lie, but I did not originate the story.

By looking at the "Resources of California," by Hittel, page 386, I find the consumption of frogs in San Francisco amounts to 4,000 dozen at $3 per dozen, with a rapidly increasing demand. If our people would learn to utilize the bounties of nature, there would be no hungry people in America.

I have been on this place twenty-five years ago "out of meat," and Apaches so bad around that we could not go for game; without sense enough to catch the abundant supply of frogs and feast like Lucullus. I prefer them *à la Bordelaise* with red wine.

I forgot to mention that Jean has a team of frogs bridled and harnessed, and when he hitches them up for a drive the bucking beats any bronco team I ever saw crossing the plains.

The temperature here to-day is 70°. Scenery unsurpassed in Italy, Switzerland, or even the fancied valley of Rasselas—not a flake of snow for several years. Plenty of arable land; more grass than millions of cattle can eat, and mines everywhere yielding paying ore; but it is a long ways from New York. CHARLES D. POSTON.

ARIVACA, Arizona, March 1, 1884.

A TAME QUAIL.—I have a quail (*Ortyx virginianus*), male. It was caught Dec. 20, 1882. I keep it in a cage three feet long by two feet wide. He is as tame and contented as he can be. The remarkable point about this quail is that, after moulting, his whole throat and subscilary line came out coal black, and his entire plumage is darker. To all appearance he is strong and healthy. Do they change their plumage this way in captivity? I feed him on wheat shorts, with a little canary seed, and keep tufts of grass in the cage, and wet it down every day. This keeps it green, and he is very fond of green grass. I wish I could get a female, I would try and breed them.—G. W. L. (Gildersleeve, Conn., March 31),

Natural History.

BIRD NOTES.

A SOLITARY robin, the only one noticed this season, appeared here on the 19th instant, and, after hopping about in a subdued kind of way for a few hours, suddenly rose up and disappeared, going south, and has not been seen since. Query—Did that Robin forecast the fearful snow-storm which commenced to rage here on the day following its departure southward? The weather for two weeks preceding the 20th inst. was warm and pleasant. Ducks and geese appeared during this time in moderate numbers and proceeded to occupy the open water places in the lakes and streams, but the snowstorm referred to, which continued for two days and nights, sent them whirling back toward the South. No jack snipe yet. ANDY PAINTER.

FORT RUSSELL, Cheyenne, Wy., March 26, 1884.

The cold winter North sent to Florida great numbers of woodcock, to the joy of the shooters. Quail have been quite numerous, and the gardeners now complain that they take more strawberries than the robins North. The Everglade kite, *Rostrhamus sociabilis plumbeus*, Ridg., has been making us a visit near Jacksonville this winter. Three are now in the taxidermist's hands, taken near here.

GEO. A. BOARDMAN.

JACKSONVILLE, Fla., March 30.

We are once more gladdened by the songs of the robins and bluebirds. They have been with us for nearly two weeks. Crows and redwinged blackbirds are also here. Several flocks of wild geese have passed here, going north. Ruffed grouse have wintered well here, and the prospect for next fall's shooting is very good. A. I. J.

CARLETON, Vt., March 30.

Spring has fairly opened with us here. Many of the migratory birds are now on the wing. During the past week or two large flocks of white-bellied swallows (*Tachycineta bicolor*) and purple martins (*Progne subis*) have arrived. The purple martins breed here in holes in the tops of decayed trees. The woodpeckers seem to be out in full force, and the cry of our northern species (*Colaptes auratus*) is often heard. Redwing blackbirds (*Agelæus phœniceus*), meadow larks (*Sturnella magna*) and bluebirds (*Sialia sialis*) are becoming more plenty every day. I have not seen a robin for several weeks. The weather is very delightful here now. All the wild flowers are in bloom, and the birds' tuneful voices are heard from morn to night. J. C. C.

CHARLOTTE HARBOR, Fla., March 27.

Mr. Peter Johnson, who lives about nine miles from here, yesterday morning shot a golden eagle (*Aquila chrysaetus*), length, 3ft. 1in., extent, 7ft. 1in. Like the one "J. S. P.," of Lockport, reports, this one had its legs and feet full of porcupine quills. It was very poor, having a hard winter of it undoubtedly. The Grand Army of the Republic will have me mount it for their hall. The first appearance of the birds was on March 24, when robins, bluebirds, chipping sparrows and blackbirds put in an appearance. C. F. C.

WAUPACA, Wis., March 26.

I have noticed a habit in the woodcock for several years past that I have never seen reported in your paper. They begin to lay as soon as the snow is off in March, and while the female is sitting, the male, just at dusk, will begin to rise with a chippering noise and continuing to rise in spiral circles out of sight, then it will descend in a straight down plunge, with a short, sharp whistle, and after alighting on the ground it makes a noise very much like the common night hawk. Have other observers noticed it? Saw white-breasted swallow March 21, robins and blackbirds March 10; bluebirds have been with us all winter. There are thousands of water fowl in Narragansett Bay, and off Point Judith the gunners are killing great numbers of them.

WATER FOWL.

SOUTH KINGSTON, R. I., April 2.

["Water Fowl" is notified that this habit of the woodcock has been known for many years, and commented on by all writers on the species.]

"What kind of a bird is that?" said —— this morning, pointing at the same time toward a brown-colored bird then clinging to the side of a small tree.

"That is a scansorial bird of the genus *Picus*," answered the man with spectacles.

"O, yes, so it is, I see now; but really, I thought at first it was a woodpecker." The subscriber moved on.

Chickadees, woodpeckers and killdeers are here, the two latter varieties just arrived, and first noticed about 8 o'clock A. M. A warm wind from the south, well laden with moisture, has prevailed for the past twenty-four hours until about an hour since, when it commenced snowing, the wind changing to the north. The snow is now two inches deep and still falling. ANDY PAINTER.

FORT RUSSELL, Wyoming, March 31.

The woodcock were just a week later in appearing near my home in New Jersey this year. Last year I heard and saw the first ones March 14. On the 23d, our old friends the phœbe birds, were examining their former nesting place over the dining-room window, under the piazza.

GEO. SHEPARD PAGE.

STANLEY, Morris County, N. J., April 2.

March 1, saw a flock of black snow buntings; 3d, first chipping sparrow; 4th, shore larks and snowbirds abundant; 6th, first bluebirds; 7th, saw a song sparrow; 8th, this morning I observed snowbirds and shore larks flying north, and at night they were flying south in large flocks. I observed this for four days; 12th and 13th, song sparrows and bluebirds plenty; 15th, saw first robin; 19th, saw a fine cock grouse or partridge budding in an apple tree, I watched him for several moments and he did not seem in the least afraid; 20th, saw first chipmunk or ground squirrel. It was a gala day for the birds on the 20th, cedar birds, bluejays, bluebirds, robins, song sparrows, purple grackles and cow buntings were abundant everywhere. 21st, saw a meadow lark near Syracuse, N. Y., and have heard of their being quite plenty on the meadows by the Onondaga Creek; 22d, hawks of two species have put in an appearance to-day, the black hawk and the redtail hawk; 23, a phœbe bird took a seat in a hickory tree, where she rocked back and forth with great gravity and had considerable to say about "phœbe, poor phœbe;" 27th, I saw a pair of killdeer plover on a wheat field, and also saw a spotted sandpiper, flying over; 29th, saw two white-bellied swallows to-day. Severe cold weather up to April 1. G. A. K.

ONONDAGA HILL, N. Y.

SOME FLORIDA PETS.

I WAS much interested with "How do They Live," in FOREST AND STREAM of Feb. 7. My heart goes out to the writer, and I warm toward him, or any man who dares express his kindly feeling for our little friends of the woods.

Down here in Florida we have lots of outdoor pets, and although there is no severe cold weather here, yet it is cool enough in a norther to make them seek for shelter. We have three little fellows in particular, who often come to the house for shelter and protection, they are about the size of a wren and of dusky brown color.

The first we noticed them was one day when it was blowing furiously, and there was a driving rain. They came under the veranda, taking refuge under an old rubber blanket, which hung over a chair. There they remained all night, and in the morning, after a hearty breakfast of crumbs, they merrily flew away.

The next cold rain they came again, and failing to find any shelter on the veranda, they came to the window. This being opened they entered without any hesitation and remained all night as before. They have now become so tame, they will come at our call, and will hop about within three feet of us to get the crumbs we throw them.

Not long since, while eating breakfast, a fluttering was heard, and in at the open door came one of our little friends, closely followed by a small hawk. The hawk finding his prey was beyond his reach for the present, retreated in good order to a tree near by, where he sat with great gravity until a charge of shot knocked him over. I set him up and he now sits perched on my inkstand watching me write.

We have two more pets which were very cunning for a while, but they are becoming entirely too familiar. On one side of the house and quite near it stands a large live oak. Last fall when the acorns were full-grown, we noticed two crows coming every day for acorns. When they found they were not molested they became perfectly fearless, and would pick and shell the acorns while we sat on the veranda watching them, occasionally throwing them bits of bread, meat, etc., until now they will come on the veranda, stalk about with great dignity, come into the house, and if no strangers are here, will go on the table, helping themselves to whatever they can get. A crow will steal anything he can carry, whether it be food or not. As I said before, they are becoming too familiar. I don't like to kill them, for I have coaxed them to be friends, but something must be done, as they will turn us out of house and home.

We have mocking birds here which will hardly get out of our way they are so tame. Two black squirrels live in a tree near the house, and are so fearless that they are perfectly at ease within ten feet of us, and will sit and munch a nut with all the coolness imaginable.

This is a new place and very little shooting is done here. I expect, when the place gets well settled, the birds will be more shy. I dread the day when it will be so, for I like to feel that friendship and confidence is the rule rather than the exception. And I want to say to "Nessmuk," that although I have never seen him and don't even know his name, I like him. I should like to meet him in the woods or on some lake. I couldn't believe it was "Nessmuk" if I met him in town or city. We may meet some time and swap hints on cruising. *Quien sabe.* Brave "Nessmuk;" may you and the Sairy find blue water, pleasant skies and easy carries.

I am getting ready for a cruise to the southward. Mean to spend four weeks in Charlotte Harbor and then go to Thousand Islands, perhaps further. Will write you what we see, find, feel and think about; until then, good-bye.

TARPON SPRINGS, Fla. TARPON.

PROTECTING SONG BIRDS.

I AGREE with Mr. Tingley and "F. G. S." in your issues of March 13 and 20, especially "F. G. S." in his last remarks about how few naturalists and taxidermists are to be found in the various towns and cities. The city in which I live at the North is quite a large one, and I know of but two professional taxidermists in the city, and one of these two does not work at his occupation. These taxidermists collect birds when migrating, but do not, I am sure, collect such birds as breed around our homes in summer. I do know of boys and men that shoot robins and our other song birds in the summer just for the mere fun of having some bird to kill. These are the ones that ought to be stopped. There are several young ornithologists in my city, and although their collections are not large or mounted in first-class manner, they show an appreciation and interest in their work. There is one more thing I should like to inquire into. In your issue of March 20, in an artitle entitled "Protecting Song Birds," your correspondent, "X.," gives the reply of a member of the Legislature to a taxidermist, which is as follows: "Well, perhaps you are right; but would you expect a traveler sent out to a far country to study the habits of the people to take a shotgun with him and kill and stuff the skins of all the people he could find? He would come back with a full knowlege of the habits and customs of the people, wouldn't he?"

Now if a traveler was sent out to a far country to study the habits of the people, would he not be among them nearly all of the time, and if he should at any moment want to find out anything about them, could he not do so at once? Can we do this with the birds? Are there not many species that are seen only when migrating, and then only for a brief time? Only men that have plenty of money can follow them thousands of miles from their breeding place to their winter home. Are there not many species which, if they could be caught, would not live in a cage but a very short time? How, then, can these birds be studied without making up their skins? Did not Audubon collect and make up many bird skins? J. C. CAHOON.

CHARLOTTE HARBOR, Fla., March 27.

Editor Forest and Stream:

I have been much interested in several communications and in other articles, which have appeared in the columns of the FOREST AND STREAM referring to the needless destruction of our singing and forest birds. I would like to call attention to something which seems to me to be outrageous and an enterprise deserving the most unqualified condemnation. I refer to the infamous, wholesale traffic in bird eggs, carried on by certain persons in this and other States. I have in my possession samples of circulars which are doubtless scattered broadcast over the land and come into the hands of hundreds of boys, thus stimulating them to engage in the work of destroying our birds in the most effective manner. For it is unnecessary to add that more birds can be destroyed at the breeding season with less labor, than at any other time. A nest is seldom robbed, but its entire contents are taken or injured and in many cases, to conclude the outrage, the parent birds are shot. And for what, pray! In a very great majority of cases, as is well known, merely to satisfy the passing fancy of an idle boy, or at most, an irresponsible and unscientific collector of curiosities. And I do not blame the boys, either, a fraction as much as those who encourage them in such a pursuit, instead of endeavoring to teach that birds should be guarded and protected by everybody. Listen to this from one of the circulars referred to above:

"In order to reduce an immense stock of birds' eggs, the following low prices will hold good until April 15, 1884. * * * We make a specialty of oological specimens. Over 10,000 eggs in stock. Lists for stamp. Collectors having * * * eggs for sale or exchange at low rates, in large or small quantities, will please send their lists and prices."

Then follows a long list of birds and the prices of their respective eggs. They are all there, and apparently can be supplied by the wholesale. Here are some:

Robin	$0 02	Baltimore oriole	$0 05
Bluebird	03	Meadow lark	06
Song sparrow	02	Pewee	08
Rose-breasted grosbeak	20	Etc., etc.	

Now, Mr. Editor, this seems to me a nefarious business. The idea of traflicking, buying and selling, and getting gain out of the eggs of our little feathered friends, who never do us aught but good, and deserve the most jealous protection!

Is it not contrary to law? Cannot it be suppressed?

I do not intend to say aught against the collection of birds and eggs for scientific purposes by duly authorized and responsible persons. That is a very different matter from engaging in bird-nesting as a business, and thus, doubtless, employing directly and indirectly hundreds of skilled laborers, as well as many an amateur and bungling hand, in this atrocious business, H. W. C.

RYE, N. Y.

SHRIKES CATCH MICE WHEN THROWN IN THE AIR.—A few days since I was told by an intelligent young farmer, who is attending the Union school in this city, that while drawing in cornstalks in November he noticed some birds following the wagon, catching the mice that were disturbed when the stooks were removed. So, picking up a mouse, he threw it in the air and the birds would catch it before it reached the ground, when it would fly to the fence, and, after killing the mouse, would return for more, and did so a number of times. The young man did not know the name of the bird, but stated that they breed on the farm every season, and a few remain through the winter. I told him that the bird was the shrike, or "butcher bird," but did not know the same bird that breeds here remained through the winter, although we often have shrikes here all winter. I supposed they were the great northern (*Collurio borealis*), and that the loggerhead (*C. ludoviciana*) were the only ones that breed here. I have found the nest containing eggs on the 24th of April. Recently the young man was looking at my son's collection of birds, and I asked him if he saw any like the birds that caught the mice. He said he had not. I afterward took him to a case containing a number of birds, and among them two shrikes, and as soon as he saw them, he said "those were the birds." Two weeks ago I saw a field mouse impaled on a small pear tree, and concluded it must have been the work of a shrike. The next day it was gone. Is it probable that the loggerhead (*C. ludoviciana*) remains here during the winter?—J. L. D. (Lockport, N. Y.).

AN OLD FABLE.—While riding from the village to our house, I showed to my companion, Mr. B. L. Hall, several fox-colored sparrows, and observed to him that I only saw them during their spring and fall migrations. This led to some remarks about birds, and he astonished me by saying, "I don't suppose you would believe that swallows go into the mud and have been dug out from it." This was not the first time I had heard of such a belief, but it was the first time I ever heard a reliable man say he believed it, and knew a man who had dug them from out the mud. Unfortunately this man, Mr. Benjamin Washburn, is dead. Still the writer remembers him well, and so far as he knows, his reputation for truthfulness was good. It was useless for me to combat this story of Mr. H.'s who declared he was sure that it was as he said, and that others—whose names I have not learned—knew of the finding of swallows in the mud. How so strong a belief could be impressed on a person's mind I cannot imagine. Can any readers of FOREST AND STREAM substantiate this belief? Your correspondent tried to refute it by showing its impossibility, but it was of no use.—MERGUS (East Wareham, Mass., April 4). [This is a belief which is very ancient. See Coues's "Birds of the Colorado Valley."]

COACHWHIP AND RATTLER.—Saw the last robin (flying northward) on the 25th of last month. We have had a great many with us the past winter. A large coachwhip snake over six feet long was seen in a fierce combat with a young rattlesnake to-day. The rattlesnake was probably about two years old, and was eighteen inches long. The coachwhip nearly killed his adversary, when a charge of shot put an end to both. The coachwhip snake is a great chicken eater. We never heard before, nor have we been able to find any one who has, of this snake being an enemy of the rattlesnake. It is well known that the black snake kills every rattlesnake he meets, and that where the former is common the latter are rarely seen. I also killed to-day, and preserved the skin of a very large gopher snake seven feet and one inch in length, and nine inches in circumference in the largest part. I don't want the readers of FOREST AND STREAM to infer by the above that snakes are abundant here, for they are not. This rattlesnake was the second one I have seen in two years, and I believe I am in the woods as much as any one in this section of the country, being engaged in surveying frequently, as well as hunting.—RED WING (Glencoe, Fla., April 1).

SEALS IN THE HUDON OFF SING SING.—During the middle and latter part of March, seals (*Phoca vitulina*) were quite common in the Hudson off this place. They were seen on the cakes of ice that floated back and forth with the tide; few days passing but that some of the duckers saw one or two. I received a carcass of a male that was shot by Messrs. George and Benj. Smith, on March 18, near the channel; the same day one was killed by another ducker. A few days after, when the ice was soft, it was reported that one attempted to climb up in the bow of a duck boat, not seeing the man behind the screen.—A. K. FISHER, M. D. (Sing Sing, N. Y.).

SOMETHING ABOUT THE OPOSSUM.—I have closely watched the habits of opossums and have discovered some interesting traits concerning them. On one occasion a large male opossum was captured in a trap set for rabbits. On lifting the lid the animal was found to be curled up and apparently asleep. When disturbed it slowly raised its head, opened its mouth, and in this position awaited coming events, although it did not offer to bite. In about five minutes it closed its mouth, slowly restored its head to a more comfortable position, and closed one eye as if a single optic was enough to note what was transpiring. On being roughly handled it opened its mouth widely and made a low hissing sound, but did not uncoil its body. Although the animal undoubtedly realized that it was a prisoner, it seemingly had no fear of death, as it made no effort to escape, although entirely uninjured. After waiting an hour and seeing no signs of feigning death, I left the door of the box-trap open, and walked off some distance where I could see the trap and be unnoticed by the animal. In about five minutes the 'possum yawned, stretched its limbs, and then standing up took a survey of the surroundings and walked away. I ran toward it, when it quickened its pace, but I overtook it and seized it by the tail, when it crouched down, partially coiled its body and extended its jaws. When I threatened to violently strike it (without doing so, however), its head slowly sank down, its eyes closed, its breathing was affected, and the condition of the body indicated a temporary paralyzation through fear producing temporary unconsciousness. I have made scores of experiments of reviving opossums when apparently dead by a sprinkle of cold water, and it always restored them to consciousness, having the same effect as on a human being in a fainting fit. The opossum is lazy and timid, and not as intelligent as the otter, raccoon, muskrat or marmot, and in my opinion its habit of feigning death is more attributable to fear than cunning.—*Naturalist, in Germantown Telegraph.*

Game Bag and Gun.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

In the remarks of correspondents on the "Performance of Shotguns," I find nothing as yet to settle the question as to what is the proper bore for shotguns, as each man has his particular size. I have used shotguns for the past twenty years, including muzzleloaders from 10 to 20-bore, and breechloaders from 10 to 16-bore, and my choice, first, last and all the time, is a 10-bore breechloader. Using "Westley's" argument regarding wads, if a 12 is better than a 10-bore, why is not a 14, 16 or 20-bore better than a 12. "Algonquin" says a 12-bore need not weigh over 7¼ pounds, and a 10-bore should weigh 9 or 10½ pounds. I see no necessity for a 10-bore to weigh over 8¾ pounds. He also says, if you tie the 10-bore down to 3 drams of powder and 1⅛ ounces shot, it will be simply nowhere. Now, if he will tie the 12-bore down to the proper charge for a 20-bore, the 12-bore will be in about the same place as the 10. My opinion is that guns of the same dimensions do not always require the same charge to get the best results. The proper charge can only be determined by experimenting with that particular gun.

I would say to "Westley" that the number of wads used over the powder depends much on the length of the shell and the chamber of the gun. If the shell fills the chamber, one wad that will not blow to pieces will answer, but in my experience I find that the best wads will sometimes do this, and therefore I use two. If the chamber is longer than the shell, enough wadding should be used so that the forward end of the wad will enter the proper bore of the barrel before the back part leaves the shell, or there will be an escape of gas past the wad into the shot, which will be detrimental to the performance of the gun. As for target, my idea is to have a gun make an even pattern with good penetration, even if it does not put as many shot in the specified circle.

S. S. W.

OSBORN HOLLOW, N. Y., March 29, 1884.

Editor Forest and Stream:

As so many of your readers are giving their views as to the proper size gun and right charge for different size game, I thought an experience of 25 years might help to solve the problem. For quail I use a 12-bore hammerless, cylinder bore, length of barrels 24 inches, charge 2¼ drams of fine grain powder, and ¾ of an ounce of No. 8 shot. Sportsmen will agree with me that 8 shots out of 10 are made in cover, when snap shooting is necessary. With a close shooting gun in such places the result is either a miss or the bird is torn into fragments. At 20 to 25 yards with my gun I can count on better results than with a close-shooting gun. The above is strictly a quail gun.

I use a 30-inch round barrel, cylinder and left barrel full choke, 14-bore, 6-pound gun for snipe and dove shooting. We bait about one to two acres of ground with wheat in March when the doves assemble in large flocks, and after a few days a party of five or six take stands around the field and shoot them, as many as 500 per day. For snipe and dove you want a closer shooting gun than 24-inch barrels, charge same as No. 12-24, with this difference—use for snipe No. 10 shot, and for doves No. 7. For larger game it has been a question with me whether a 12-bore, 32-inch, 9½-pound, cylinder bore gun will not kill as far as a No. 10, 10-pound, 32-inch gun.

The only advantage I find in large bore guns is, it gives a larger killing circle. It will not kill further. For such a gun, .12-32-9½, I would use 4 drams of coarse powder and 1¼ ounces of lead. The object in using fine grain powder in short barrels is that it burns faster and you get greater initial velocity. In longer barrels coarser powder has time to burn and has more staying power. The above sizes and charges I find sufficient to kill clean (not wound) and that is all a sportsman wants; besides, economy is not to be despised.

The above is for those who can afford to keep an arm suitable for every kind of game; but to those who must make one gun do the work of three I think there is no better gun than the 12-bore, 30-inch barrels, 8¼ pounds, right bored cylinder, left full choked. The charge for such a gun will vary as the size of game demands. The extreme loading of such a gun would be with me: For deer, bear and ducks, 3¼ drams powder, 1⅛ ounces lead; for bird shooting, 2¾ drams powder, ¾ ounce lead. The above is based on twenty-five years' practice in field, extending over fifteen years of carefully conducted experiments at target to get best results as to distribution and penetration, striving to get the best and most economical charge that would do clean work, and without a foolish waste of ammunition. I have never yet seen a chokebore gun that would shoot the larger sizes (6s to buck) shot well. In my opinion cylinder bore guns will shoot from 6s up to buck better than chokes. SPORTSMAN.

COLUMBUS, Ga., March 22.

Editor Forest and Stream:

In reply to "Tinker's" inquiry in regard to sight on rear of three-barrel gun, I would advise him to get a Lyman sight fitted to it. It will have to be short on account of drop of stock. The shot barrels of my Baker gun put 90 per cent. actual count of No. 4 shot, chilled, in a 24-inch circle at 30 yards. Out of 164 shot in the load, 1⅛ ounces, it put in the circle 149, and besides this it put 30 of them through one inch of pitch pine lumber. It will average about 145 with coarse powder. This gun is 10, 30-inch, 9¼ pounds. If those tube shells will do 50 per cent. better work than common ones, as one of your correspondents says, why don't some one make them? I find by loading one-half coarse and one-half fine ducking powder I can get good pattern with increased penetration, putting the coarse powder in first. M.

HASTINGS, Ia., March 31.

Editor Forest and Stream:

Some time since an idea struck me that by a peculiar way of putting in the shot a strange result might be expected. I tried it and thereby succeeded in putting No. 6 through an inch pine board at forty yards. This was the *modus operandi:* I used the usual powder charge, then one pink-edged wad pressed down, then another pushed in the shell an eighth of an inch, then a single layer of shot, then a wad of thin blotting paper. Push shot down further and then place another layer of shot evenly distributed, then more blotting paper, until you have put in an ounce. Complete by pushing all down steadily. I fired two charges only, with the above result, and gave up, as the shot bunched. But perhaps some cute, persevering sportsman may work something tangible out of this idea and give us the benefit of it.

PICTON, Ont. R. P. J.

Editor Forest and Stream:

I use for a field gun a Remington double-barrel breech-loading shotgun, model of 1882, 12-bore, 30 inches, 8¾ pounds, full choke. Experience has taught me to load as follows: 3¼ drams Dupont's chokebore powder, one of Eley's thick felt wads, one ounce of shot, and one thin cardboard wad. This way of loading gives good satisfaction; still it is not perfection. J. C. Y.

WASHINGTON, Mich.

A MEMORY.

WITHIN my cosy room, nothing meets the eye but bright and cheerful things. Outside how different; the ground is covered with snow; the arctic wind howls dismally around the corners of the house, rattling the doors and windows in trying to gain admittance; and the rain is unceasing, freezing the moment it reaches the ground. The trees are encased in ice, presenting to an eye unaccustomed to the sight, beauties of strange and fantastic forms. It does not interest me. The moaning wind has carried my thoughts back to a most successful duck hunt which commenced Nov. 15, 1882, and ended the following evening. I will try to give the particulars.

Our party had been anxiously awaiting a flight of wild fowl. A few had taken possession of the bayous, lakes, sloughs and ponds, but not in sufficient numbers to warrant a good bag. Each day, however, added to their numbers; but it was not until we saw Gen. Hazen's "off-shore" signal hoisted, indicating a norther, that we commenced to arrange matters. Sure enough that night, Nov. 14, a norther came out, blowing with unusual severity, and lowering the temperature to near the freezing point.

Next evening found the norther considerably abated, game flying in abundance, and our party on the wharf eager to be off. Finally, everything being arranged we weighed anchor, and, under the influence of the still brisk wind, skipped merrily along toward Caronkaway, West Bay.

Caronkaway takes its name from an extinct tribe of Indians, who, in former days, made it their fishing headquarters. Nothing remains to indicate their camping grounds but immense piles of oyster shells, remnants of former feasts. Occasionally upon removing these, one comes upon a bone knife or arrow head.

We arrived at our destination just as the sun sank to rest behind a bank of purple clouds, lighting the sky most beautifully. We anchored in about four feet of water under the lee of the land. This protected us most effectually, and as the yacht swung to her moorings we found we were in most comfortable quarters. Arriving too late to take advantage of the magnificent evening shooting, we consoled ourselves by making the cabin as comfortable as possible, and, amid clouds of tobacco smoke, each related past experiences. In this way time flew by. About 10 o'clock the Captain remarked, "Time to turn in, boys," and we took the hint.

I was awakened the next morning by voices on deck and feeling the yacht pitching uneasily. Upon dressing and joining the others, I found, to my chagrin, that they had had coffee and were "fixing up." When I asked why they had permitted me to sleep, they replied, "Well, you see you looked so sweet, and your nasal organ was giving vent to such euphonious chords, we thought it a sin to disturb you."

As we "piled" into the tender, previous to pulling ashore, we were aware that daylight was fast approaching. Things could be seen but indistinctly.

We had accomplished about half the distance between the yacht and shore, when the Captain frantically grabbed his sides and exclaimed: "Oh! my ammunition!" He had left his belt in the cabin. Here was another delay, but it took the laugh off my shoulders, and I was glad it occurred.

We reached shore at last, and after making the tender fast each sought a stand. I took one I had occupied on a previous occasion and waited in silence. The faint reports borne across the bay from Galveston Island, seemed to warn me that I would soon have my hands full. A deafening report from behind attracted my attention, and almost before I had time to turn, a flock of swiftly moving objects were upon me. I fired, and had the satisfaction of bringing down three. I was eager to know what they were, but I had no time to bring them in, for a bunch of teal immediately claimed my attention. On they came, and just as they got to me I rose. Upon seeing me they bunched, which gave me an excellent opportunity of pouring in both barrels. I got eleven. Three consecutive shots at single sprigs were next missed in beautiful style. I began to think that if I wanted to equal my three friends, whose guns were popping incessantly, I'd better wait for flocks; in them I did more execution. After a while, however, I did better.

A lull in the flight gave me an opportunity to bring in my birds. The three killed by the first shot I fired were, much to my satisfaction, canvas-backs.

Suddenly the guns of my companions became active, and, although I could see flock after flock fly over the stands, not a feather came my way. I began to get discouraged, and had almost concluded to go to the yacht, when suddenly an immense flock of mallards flew directly over me from behind. To raise my gun and fire both barrels was but the work of a moment. I killed two, and, as in my estimation they are the most beautiful of all the duck family, I took great pleasure in handling them. I am speaking, of course, of the greenhead.

Finally, the ducks, as if tired of being made targets of, took to the bay; and I, feeling pretty hungry, followed them; first, however, counting up twenty-three birds. I thought my eleven teal would give me the advantage of my three companions in numbers, but I was mistaken. Together they had sixty-seven, added to my twenty-three, makes the total bag ninety. Not bad.

So ended the hunt. We pulled to the yacht, and, as we partook of a splendid breakfast, we discussed the incidents of the morning. NEMO (of Texas).

FRANKLIN, March 8, 1884.

MR. CONGER EXPLAINS.

YELLOWSTONE NATIONAL PARK.
Office of the Superintendent,
MAMMOTH HOT SPRINGS, Wy. T., March 23, 1884.

Editor Forest and Stream:

My attention has been called to an editorial in the FOREST AND STREAM of March 13, on the subject of the Yellowstone Park. My astonishment was great to find that so great and enterprising a journal as the FOREST AND STREAM, devoted exclusively to kindred subjects to the National Park, should have misconstrued the law on that subject. By consulting the law, you will discover that the superintendent is in no manner responsible for the appointment of his assistants. You will then read with a new meaning the extract which you were pleased to quote from one of my letters to the Secretary of the Interior, in regard to my assistants.

Secretary Teller does us but tardy justice when, in his letter transmitting my correspondence with the Department to the United States Senate, on the subject of the Park, he candidly admits that the superintendent and his assistants were powerless, under existing law, to enforce the orders and rules of the Department for the government of the Park.

I have tried for the past two years to impress upon the Department our helpless condition here, for the want of the necessary authority and power to enforce the law, and I have been answered only by scolding letters, and secret spies and the universal howl of an ill-advised press throughout almost the entire country. Added to all of which has been the ceaseless and untiring hostility of this mis-named Park Improvement Company, chiefly by and through the company's superintendent and manager, C. T. Hobart, and why and for what reason, ask yourself the question, Mr. Editor, and I will not fear but you will arrive at a just conclusion.

As to Secretary Teller himself, it is but just for me to say, that I do not believe he has been personally aware, until very recently, of the condition of affairs here, as he has been obliged to leave these matters to the care of his assistant on account of the numerous and important duties pertaining to his high office elsewhere.

But, Mr. Editor, I think I see for the Park the dawn of a brighter day. Congress is better informed as to what is necessary to be done to render this marvelous park the pride of the American people, and a wonder to the whole world.

I am much pleased to find in your paper the letter of Mr. Arnold Hague, of the United States Geological Survey, upon the railroads in the Park. And I am more than delighted to find that I have in your paper and Mr. Hague such powerful allies in this great battle between the speculators and the people. I have opposed the scheme of allowing railroads to enter the Park from its inception. I have sent my protest to the Secretary; have written to members of Congress and to the editors of newspapers, calling upon them to sound the alarm and let the people know what designs the speculators have upon their heritage.

You very justly remark "that public opinion has not been altogether just to the superintendent of the Park," and I will add, neither has it been just to the assistant superintendents, for I feel bound to say that a majority of them are excellent and efficient men, and have accomplished all that any like number of men could have accomplished, situated as they have been.

In conclusion I desire to say that I neither ask nor expect any mercy from the public, should examination prove that I have been in fault. I ask then only simple and impartial justice.

P. H. CONGER, Supt. Yellowstone National Park.

[Mr. Conger is in the right, and we regret that we should have done him injustice in this matter. The appointment of the assistant superintendents rests with the Secretary and not with the superintendent. We wrote of the law as it should be, not as it is.]

NOTES FROM IOWA.

THE ducks are in, and I can hear the guns from early morning until far into the dusk of evening. More geese went over us, going north, this spring than I ever saw before, but none were killed in this neighborhood, that I know of.

There is a splendid lot of prairie chickens here now, and we do hope that they will stay with us, and that the weather will be favorable to their propagation this spring.

Quail are fairly plenty. I know of enough to stock this place, if they are only permitted to hatch and the clutch is not drowned.

We have given up going on our semi-annual hunt this spring, and I am just shooting in the evening. I get from one to three ducks each time I go out, and I am satisfied. Day before yesterday, the 26th, I heard the first jack snipe. If the weather stays as it is, jack snipe will be in thick in a few days, and the ducks—well we hope to see them in the fall.

I was in our county seat (Weppello) the other day, on business, and found that they have a rifle club organized there, and have a regular day for practice each week. Mr. Cole is their coach, and if they all could shoot as good as he can, their scores would run high. He is manufacturing a gun patented by himself, and thinks, like all the rest of gun makers, that his gun is the simplest and best. One thing is sure, he knows how to handle his own gun, as his score will

show. I am no rifle shot but I do enjoy talking to the man who is a good shot, and can pile up the fives—75 out of a possible 75, at 800 yards.

Now that the snow is gone, my pistol is laid away, and when I take it up again there will be some practice before I take it into the field. I wish you could see my old wood house in Ohio. Many a time I have stood and used up a box of cartridges shooting at some particular spot in the wall, and I expect that some day some boy will burn it just to get the lead. MARK.

MORNING SUN, Iowa, March 28.

10, 12 OR 16.

IT is surprising how many sportsmen carry the first-named bore (10) weighing from 7½ to 10 pounds. Such a weight of iron is, I think, useless in the field, and is fatiguing to carry. I am writing now of field work over a dog. Of course in duck hunting a heavy gun is a necessity, although I have killed ducks with a 16-bore, and that at quite a long distance.

The 12-bore is, to the majority of sportsmen, the gun, good for anything, ducks included; as a 7½ or 8-pound gun will burn 4 drams of powder nicely, and kill almost as far as a 10-bore with less weight to carry.

A 16-bore is, in my estimation, the field gun *par excellence*, and to cut down quail and partridges with this handy gun is truly a pleasure to the sportsman who aims it. The 16-bore is just heavy enough (6 to 6½ pounds), and 2¾ to 3 drams of powder is sufficient for a load for this handy little gun, instead of throwing a heavy load of shot with from 3 to 4 drams of powder after a bird, and about the same bulk of shot.

I am very glad the smaller bore guns are coming into use, much more than formerly, and it is truly more artistic to kill quail, partridge or woodcock with this little gun. Of course some few carry a 20-bore, but not one man in four hundred carries such a tool. I am told the 20-bores kill at a surprisingly long distance, but never having used one I of course can't say much about them. Let us carry a small gun in the field, and not lug a cannon of 10 pounds weight, for such is not pleasure but toil. 16-BORE.

MADISON, N. J.

ST. LAWRENCE GAME CLUB.

AT the third annual meeting of the St. Lawrence Game Club, held recently at the office of Mr. L. D. Hoard, at Ogdensburg, N. Y., the President's address showed that more than twenty indictments have been found against individuals for hunting deer out of season, and a large number of suits have been brought to a successful issue for minor offenses. Mr. Hoard says:

"From a memorandum of the assistant district attorney, Mr. L. P. Hale, of Canton, and on file with the secretary, it appears that since the last annual meeting twenty-two indictments have been found by the grand jury, against thirty-six different individuals for unlawfully killing and dogging wild deer, and nine indictments against six different individuals for unlawful fishing. That convictions and pleas of guilty have been obtained in seven cases and fines imposed to the amount of $195, and one case dismissed by the district attorney for want of evidence, leaving undisposed of one case pending on appeal and twenty-three cases in various stages of advancement. Mr. Hale accompanies his memorandum with the statement that 'of the earlier of the cases noted as pending, repeated attempts have in some cases been made to arrest defendants, thus far without success, but through no fault of the district attorney. Other cases have been discontinued either by the defendants or the people.' For further details of said memorandum, as to names of defendants, dates and character of the offenses described, I refer to the document itself. The above-mentioned results show an amount of labor on the part of our esteemed member and assistant district attorney, which entitles him to your favorable consideration and hearty thanks, at least, if not to some more substantial testimony of your approval.

"It would appear from the foregoing that the necessary machinery for the successful enforcement of the game laws in this protection district has been secured, and one of the leading objects of this society thereby satisfactorily accomplished. So far as the enforcement of the law is concerned, we have only to continue, as heretofore, our encouragement and support of the officers in the discharge of their duties, to render it certain that in the near future the punishment of the offenders against these laws will be as fully sustained by the force of public opinion as the bringing to justice of any other class of criminal offenders now is."

The president also alluded to the importance of stocking the St. Lawrence River, and the streams and ponds of St. Lawrence county, with food fish, and made valuable suggestions as to the best methods by which this could be done.

The treasurer's report shows the society to be be without debt and to have a balance in the treasury.

The following named gentlemen were elected trustees for the ensuing year: John Webb, Jr., Gouverneur; George P. Ormiston, Governeur; M. D. Packard, Canton; S. D. Kimball, Canton; J. H. Rushton, Canton; Jas. R. Smith, Russell; William Peters, Ogdensburg; J. H. Brownlow, Ogdensburg; Josiah L. Brown, Potsdam; Allen Olmstead, Potsdam; Wm. Stillwell, Ogdensburg; D. G. Wood, Gouverneur.

Mr. McNaughton addressed the association on the importance of having the State game protectors act together in all cases of violation of the law. Continuing, he alluded to the desirability of having fishways in all the dams in the county, and recommended that a law be drafted and presented to the Legislature. In order that this might be done, he moved that a committee of five be named by the chair to take steps to have such a law pass. The motion having been adopted, the president named as such committee Joseph McNaughton, Sidney Brown, William Peters, L. W. Russell and John Webb, Jr.

The following committee was appointed to go to Utica on the 11th inst. to attend the St. Lawrence Anglers' Association: J. McNaughton, Dr. Brownlow, Wm. Stillwell, L. D. Hoard.

The thanks of the club were unanimously voted to District Attorney Lang and his assistant, L. P. Hale, for their persistent efforts to punish transgressors of the State game law.

GAME IN MISSISSIPPI.—No game is left here now except bear. They are thicker than on Wall street. If you know of any one wanting a bear ranch I can furnish them, and will guarantee an income of fifty bears per annum.—TUCKAHOE (Belzoni, Miss., March 31).

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

I must request permission to correct an error in my letter published by you in your issue of February 21, where I quoted from Farrow's letter that the drop of the ball of the rifle was 3 inches at the 200-yard target when fired with the 100-yard sight. I received a letter from Mr. Farrow stating that this should be 13 inches instead of 3; the drop of the .45-75 being 2 feet 6 inches, and of the .45-60 2 feet 10 inches.

Heretofore the discussion on hunting rifles has all been in the direction of calibers and charges, and I now would like to ask of your numerous readers if something besides proper calibers and charges is not essential, if not vital, to the owners of a hunting gun; for may we not have a perfect barrel, with proper caliber and charge, and still have a gun that is only partially effective from the lack of some other essential to its proper aiming and firing?

In shotguns we have various "lengths" and "drops" to stocks, so that the intending purchaser can procure a gun that will "fit" him, and come up promptly and properly for rapid wing-shooting, but in rifles have we any such variation? Has not the making of rifles by machinery caused an invariable model to be adopted by each maker, so that one has to submit to an improper fit sometimes if one wishes to possess the gun of a particular maker, through the inability to procure other than the model adopted by that maker?

I have not the dimensions of the guns of various makers, so I am unable to give the length and drop of stock of each; but I am satisfied that an examination of the various guns possessed by your readers and correspondents, will show that there has been no standard adopted, and that a considerable variation will be found.

I will give data as far as I have it from measurement of guns in my possession, to show what I mean:

Ballard, .32-caliber target rifle	Length 13in.,	drop 3¾in.
Peabody, .45-caliber	Length 14in.,	drop 2½in.
Springfield, .45-caliber	Length 13¾in.,	drop 3½in.
Remington—Kun pattern	Length 13in.,	drop 2⅝in.
Baker, three-barrel	Length 14in.,	drop 3½in.
Marlin, .45-70	Length 13in.,	drop 3½in.

These measurements are from the trigger to the middle of buttplate for length, and from line of point-blank sights to toe of stock for drop.

One might say here was variety enough to choose from; but it will be observed that the variety is in different styles of guns, and so far as I know, there is no variety in the same style of gun, unless one pays heavily for the special stock.

In military rifles such variety is not to be expected, but in hunting rifles I see no reason why such variety, particularly in the length, should not be made. Variation in length would also vary the drop without any change in the angle made by the axis of the barrel and center line of the butt; but short and crooked stocks, as well as long and straight stocks, might be wanted also.

It is conceded that one can learn to shoot, and shoot well, with almost any form of stock; but could not the same man shoot better with a gun that fitted him naturally and easily, without constraint, than with a gun that did not fit him and which caused constraint? And would he not sooner acquire skill and expertness shooting such a gun than when he is forced to learn and every time take a constrained position?

Besides the length and drop of stock, does not the form of butt and butt plate have more to do with successful shooting than is ordinarily conceded? I think every one will admit that constancy of position in aiming is one of the necessities for fine shooting; butt high on the shoulder for one shot and low for the next will not make good shots, and the general form of buts has nothing with which to insure the proper position.

I don't know that I would advocate the butt with horns on heel and toe for this purpose, though nearly all the old muzzleloaders had some such form of butt plate; but cannot some better form of plate be adopted than those we have now, that will give more grasp to the shoulder and insure the same relative position of the gun every time it is brought to the shoulder?

In the days of the muzzleloader the stock had a "patch box" set in it, and now that the muzzleloader has passed out of date, this patch box has also vanished from the stock.

But are there not uses that this box could be put to, that would make it a valuable addition to the breechloader? Could it not be adapted to carry a screw driver and such extra parts as are most likely to be useful in the repair of a gun? True, one can carry them in the pockets, but when wanted, they are almost certain to "turn up missing," from having been left at home or lost from the pockets, while if in the gun stock a place is made for them, they would be more likely to be at hand when needed, as that would be their place, and no reason for their being missing.

I once had a gun restocked from a pattern made exactly to my "fit," with butt plate to fit the shoulder, and a box of this kind (taken from an old muzzleloader) in the stock, and I can therefore tell from experience not only how much better I could take quick shots with this gun that fitted me exactly, than I could before it was restocked, but also how "handy" this box was. In it I could carry a small folding screw driver and spare parts, with an oiled rag to wipe my gun when necessary to keep the outside from rusting in the rain, and I feel as though the box were indispensable.

With many of our breechloaders (in fact nearly all) no provision is made for a cleaning rod being carried in any way, and how many times has the want of such a rod been severely felt when in the field and away from possible rods in camp? The Winchester rifle, and the Government carbine have such rods placed in the stock, and so has the Fruend rifle, and many a time their usefulness has been proved, when some accident has disabled a gun temporarily from a shell not extracting. Accidents will happen, and when one goes on a hunt every precaution should be taken, not only to prevent such accidents, but also to have the means to overcome them should they happen. I would not recommend the use of this metal rod as a cleaning rod, nothing but a wooden rod should ever be used to clean a gun with, where a rod is used at all; but it is useful nevertheless, to drive out tight shells, should one stick, or to take out a headless shell, should the head of one blow or tear off; in the Springfield carbine a headless shell extractor is in the butt with the jointed ramrod, but a bullet shaved down and "upset" in the headless shell will generally answer to drive out the shell, provided one has the ramrod to do it with, and I cannot, therefore, too strongly recommend its adoption in the stocks of all guns—shotguns as well as rifles.

One can get pistol grip with checkered fore end and grip by paying extra for them, and some makers now place pistol grips on all their rifles, and this is certainly a move in the right direction. With some of the under lever gun this may not be necessary, as the shape of the lever takes the place of this pistol grip; but I would be glad to see the straight grip become a thing of the past on all (even our military) rifles. Better holding and more even shooting would result, in my opinion, especially when in cold weather one has to use gloves.

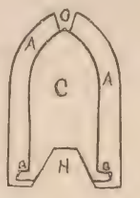
Do makers pay enough attention to the position of and shape of the trigger? We all know that the nearer one applies their power to the end of a leaver the less power it requires to do a certain work, and how many triggers are there that allow such application of the pull anywhere near the end? Besides this, should not the trigger be so placed and shaped that the pull comes naturally up and across the grip, so that a squeeze of the finger rather than a pull would be the proper application of power to release the scar? I have one gun with trigger like this, and although in one direction it will bear a pull of several pounds, when applied in the proper line of this squeeze a much less force will fire the piece.

I am speaking now of hard triggers. I have seen too many accidents ever to want to use or see used any more "hair" triggers, and I claim that better shooting can be made with a moderately hard trigger, that one can hold on to as the piece is pressed to the shoulder, provided it is made of the right shape and placed in the proper position.

Why should not triggers be roughened, the same as the head of the hammer is, so as to prevent slipping of the finger in pulling it? and why should some triggers be made of such narrow surface for the pressure of the finger? Would it not be more comfortable and better in every way to have a broad roughened surface for the finger to hook around, rather than the narrow smooth surface so often seen?

Speaking of hard triggers reminds me of why some are so hard and how easily it can be remedied. A great many are hard because the nose of the scar is a wedge-shaped surface instead of being the surface of a cylinder generated about an axis passing through the center of the screw which forms the pivot for the scar. The nose being a wedge and the notch in the tumbler being the reverse, the full strength of the main spring has to be overcome, as the tumbler has to be rotated slightly backward before the scar can be disengaged; whereas if this nose were the curved surface I speak of, and the notch a similar curved surface, these two smooth surfaces would glide smoothly over each other, and the scar would be easily disengaged, no matter how deep the notch might be. I prefer a "creep" to the trigger, so that I can feel it gradually press back, rather than a trigger that gives way all at once, like a bound door suddenly letting go.

All who have practiced rifle shooting will, I think, agree that pulling trigger is the hardest part to learn thoroughly, especially in off-hand work, and that, if a firm, positive and proper pull could be given, much improvement would result. It is no easy matter to hold a nine-pound rifle off-hand, keep it on the bullseye, and at the same time pull off with a "three-pound" trigger, without deranging the piece, and in my opinion there is much yet to be done in this direction to make the piece easier shooting, not in the way of making softer or hair triggers, but those that can be felt and pulled, but yet pulled gradually in the right direction, and that when they do "let go" will do so without imparting motion to the gun.



I would conclude by saying that I am well aware of the difficulty of introducing changes that will necessitate change in forms of the metal breech frames in breechloaders, and therefore change of tools and plant to make them, that would be necessary to have stocks of various drops—and such changes would only be made upon its being made apparent that they were desired by the majority—and for this reason I hope the views of your various readers and correspondents may be freely expressed, either for or against the proposed change.

It may be less trouble to change the forms of trigger, as probably less expense in change of tools and plant would be necessary to produce them, but on all these points I merely ask for opinions, having merely expressed my views, and the views of several with whom I have discussed these subjects, in calling attention to the matter.

FORT MCKINNEY, Wyo., March 7. C. D.

Editor Forest and Stream:

After giving the common express bullet much study, I am convinced that it is a failure, as it lacks penetration, but if it could be made to make two holes in the skin of a grizzly it would be the best bullet by all odds for large game. Now such a bullet should have all the qualities of a hollow-pointed bullet, and also, if perfection is wanted, those of a solid one. To meet these needs I have planned the following, express envelope bullet.

Parts—A A, expanding envelope. O, hollow at point. C, solid bullet. B B, flanges at base of solid bullet. H, conical cavity at rear.

A solid bullet with conical head, and smaller than the bore of the piece from which it is intended to be fired, is cast, and should be made of such a mixture of tin and lead that it would not weld with pure lead. This bullet then being placed in the mould, pure lead is poured in, forming an envelope around it, with a hollow point, as shown in the engraving, this envelope on striking would expand, making a large hole, while the core or solid projectile would give all the penetration that could be desired. The envelope might go on with the bullet proper, after expanding, which would increase its efficiency much. The flanges in the engraving at the base of the bullet are to prevent the envelope from separating before the moment of contact.

NORTH GRANVILLE, N. Y., March 28. HAWKEYE.

Editor Forest and Stream:

As a contribution to the very interesting discussion now going on in regard to the choice of hunting rifles, allow me to give briefly my ideas in regard to them, premising, that I speak only of large game, with which I have had considerable experience during the past eight years in the West.

For a gun for general use I very greatly prefer a double express rifle, .45 or .50-caliber, and have used them exclusively during the past three years. I have two, both .45-caliber; one, a very fine imported gun, takes the Eley 3¼-inch shell; the other, made to my order, takes a Sharps 2⅞-inch shell. I always load my own shells, casting express bullets of four different weights and shapes, besides occasionally using a solid bullet and also round balls, two or three in each shell, which I find very convenient for running shots at coyotes, wildcats, etc. I attach the greatest importance to heavy charges of powder and, for most purposes, a light bullet of 250 to 325 grains, regulating the effect of the bullet by the size and shape of the hole in front, and by the proportion of tin used to harden it.

Another important point that seems to be not generally known, and which is not found in the one or two makers of so-called express rifles advertised by American makers, is to have a very slow twist to the rifling, one turn in four feet being quite enough.

Such a double rifle, with slow twist, and shells properly loaded to get the full effect of the express principles, weighing not over 9 or 9½ pounds, and with 26 or 28-inch barrels, is, in my opinion, by far the most effective and convenient hunting rifle made, and with them I have more than once got out of a "tight place" with a charging grizzly, the only really dangerous animal in this country.

Personally I dislike repeating rifles, as I have too often seen them disabled, usually by the jamming of a cartridge, to have confidence in them; and rapid firing is by no means synonymous with effective firing, in fact, it is very seldom effective.

Of single-barreled rifles I like the Springfield, or "needle gun" as it is often called, and the Sharps, and this preference is shared by the great majority of frontiersmen whom I have met. The actions are strong and simple, and will stand very hard usage without getting out of order. Forty-five is the smallest caliber I would use; 50 is far preferable to .40, except for those persons (who seem to be more common in the East than I have found them to be on the Western hunting grounds) who invariably put their bullets precisely where they wish to; for these a .32 or .38-caliber is all that is needed, but I cannot recommend anything smaller than .45-caliber for ordinary mortals.

If bear shooting at short range is expected, a more deadly arm than a short and heavy 12-gauge cylinder shotgun cannot be found; the wound and shock is terrible; the gun is easily and quickly handled, and it is besides often very useful for shooting ducks, grouse, etc., when large game is scarce.

Few persons know what a deadly weapon this is when loaded with ball, and after a little practice with balls of the right size, it may be used with considerable accuracy at 75 yards.

For one who has used a good double express rifle on large game it is easy to see that a large proportion of those who write on this subject have had no practical and but little theoretical experience with these guns. Many are persons who seem to consider that "pumping lead" (a disgusting expression that deserves a place in your *index expurgatorius*) at game as long as it may be in sight is the height of sport, and who care nothing for wounding a dozen animals, who escape to finally die of their wounds after hours and days of suffering, if only they occasionally happen to hit one in a vital spot. Such persons are beyond the reach of argument, either as to guns or their own selfish and brutal ideas of sport; but for those who like to kill and find the great majority of game they hit within fifty yards of where it stood when fired at, I can confidently recommend a trial of the express rifle.

I cannot agree with your statement in your issue of Feb. 28 that "rifles require greater strength at the breech than could be secured by shotgun breech mechanism," for hundreds of such rifles are in use, and so far as I am aware all double express rifles are loaded just as a shotgun of the same maker would be. One of my rifles is underlever action without extension rib. It has done good and hard service for its two owners for at least seven years with shells holding about 130 grains of the strongest powder, and is now as tight and closely fitting at the breech as the day it was finished. The other is a snap action with extension rib, and although it has not had as long or hard service as the other, I think it will wear as well. These are both light and easily handled guns, and the recoil (which some writers imagine must be excessive on account of the amount of powder used) when a light bullet is used is really less than in most common rifles that use a heavy bullet with a much smaller amount of powder, and once used I do not think any one would again hunt with the absurdly heavy single-barreled rifle as usually made, even without reference to the far more satisfactory results of a good double express using a suitable bullet. AREBARDEA.

Editor Forest and Stream:

I am more interested in a squirrel gun, and my ideal would be a .38-caliber, made as light as it could be to retain a good shape and balance, and be strong enough to be safe and durable. It should be chambered for the extra long cartridge, and be large enough so the shell could be made for a swaged bullet of full size all the way back, so as to insure a steady flight.

The different kinds of ammunition should be put up in the long shells, and the space between the powder and lid filled with wads. In that way the lead could always be seated in the rifling and no chance of upsetting or starting crooked. I would prefer a singleloader, because the arm would be lighter and the action less complicated, and if it is well made, so that the shells will not stick, there need be very few good shots missed. I would say further that the ammunition should be made so as to be reliable up to 75 yards, and by making slight calculations this would be effective up to 100 yards. The proportion of powder should not be less than one to four for good shooting at 50 to 75 yards, and I would be satisfied with a .22-caliber, provided the changes would be made so as to insure a reliable gun at 75 yards. N. J. S.

BROOKVILLE, Pa., March 31.

GAME IN TEXAS.

I CAME down here last fall, and was agreeably surprised to find myself in a region where game was abundant. The sportsmen of the town and neighborhood were then killing deer in abundance. I had no opportunity to participate in the sport, but as soon as the quail (partridge they call them) were fit to kill I took a hand in, going out at least once a week.

Previous to my leaving the North my shooting had been principally done in New Jersey, where one would consider himself amply rewarded by a find of four or five bevies and a bag of a dozen birds, after a long day's tramp. No wonder then that I was astounded when the first day I went out Waxy McCoy brought me to a field, not a mile and a half from the business portion of the town, in which we found six bevies of from twenty to forty birds each. They gave us enough hunting the whole afternoon, never leaving the one field. Of course the birds and ourselves had ample room to move about in it, consisting as it did of about five hundred acres. Bags of from forty to fifty birds are frequently made in an afternoon by two guns over a pair of good dogs, and that is saying a great deal for the number of birds, when it is considered that the shooters here never follow them into the brush, hunting up a fresh "gang" when the bevy seeks the kindly shelter afforded by the pines and undergrowth.

The English snipe seem to remain with us all winter. I have shot a few each month from September to the present time, killing sixteen one afternoon two weeks ago, the best bag of them I heard of being twenty-six to two guns for one afternoon's shoot. Many of the native sportsmen do not consider them game, and will not shoot them, but believe me, your humble servant and other hunters in town who have been raised in the North, know how to appreciate them for the sport they afford and for their table qualifications.

As you predict in your last issue, the little beauties must be on their way north, as the other day I shot but four on ground which was literally alive with them a short time previously.

Woodcock must be a rarity here, as I have seen only two; one was brought to town by a countryman, who had shot it, and wanted to know if it were "good to eat." Think of it! The other I flushed while shooting quail one day, and was so surprised at its appearance that I missed him clean.

A friend brought me the other day three birds which he had killed with one shot, within the precincts of the town, and asked me what they were, as he had never seen any like them before. They were large yellow-leg snipe. Is is not rare to find them so far inland? As I looked at them, visions of old times on Barnegat Bay arose before me. Many of them had I shot between Bill Chadwick's and Uncle Jake Herbert's, when there was not a sign of a human habitation between those two places, and the railroad brought you only as far as Squan.

Wild turkeys are plentiful here, and can be found almost anywhere within a radius of five miles of town. I heard of a fine gobbler being shot day before yesterday. The prairie chicken is about the only southern game bird which is not found in this immediate section, as we are surrounded by dense pine forests, but they are found in large numbers a short distance further west. The cottontail rabbit is very plentiful too, you kick them out of bushes every few steps when quail shooting, and the tall pines are alive with squirrels. ALIQUIS.

JEFFERSON, Texas, March 29.

WOLVES IN MAINE.

THE Maine wolf cry is being narrowed down to pretty close quarters, and when the FOREST AND STREAM stated some weeks ago that there were practically no wolves in that State, its assertion was as near the truth as can ever be approached concerning such subjects. All the prominence the subject has been given by the discussion drawn out has failed to bring to light any but a couple of dead wolves, one killed several years ago and the other last December—provided it was a wolf.

A Portland correspondent writes:

PORTLAND, Me., March 29, 1884.

Editor Forest and Stream:

In answer to your inquiry about a wolf being at Fryeburg, in this State, will say that John Heath caught what was called a Canada gray wolf Dec. 22, about a mile from Fryeburg Village. His trap was set for fox. The wolf was a large one, measuring 5 feet 8 inches from tip to tip, and stood 2½ feet high. He dragged the trap, heavily clogged, more than a mile. He was very savage when found, making a vigorous attack on Mr. Heath, who dispatched him with a shotgun. A few days before he was caught he attacked a young man while cutting wood, and tore his clothing, scratching him considerably before being frightened away. F.

This is a good wolf story, but as Fryeburg is about fifty miles to the northwest of Portland, the account must have grown in traveling there. The FOREST AND STREAM has carried its investigations of the wolf subject still further. The selectmen of Fryeburg have been written to, since they would be called upon to pay the bounty, and would be very likely to know the truth of the matter. One of the board writes:

FRYEBURG, Me., ——— —, 1884.

Editor Forest and Stream:

Yours, making inquiries about a wolf killed here last winter, is at hand. I would say there was one killed here and the bounty paid. The animal was captured in a common trap; was undoubtedly a traveler, as they are not common in this part of Maine. They are very seldom seen or heard. This wolf was of the Canada gray species, and is supposed to have strayed from the forests of that province. His size was medium. Will give you other information with pleasure, if desired. ——— ———, Selectman of Fryeburg, Me.

This letter gives no account of an attack by the wolf or wild animal upon a young man or anybody else. A letter from another correspondent in the same county says:

Editor Forest and Stream:

No wolf has been killed in this section for a great many years. I hear that one was killed in New Hampshire recently.

Still another correspondent, from a town adjoining Fryeburg, writes:

Editor Forest and Stream:

Yours is received. I have heard that a wolf or wild animal was killed in Fryeburg or Lowell.

It seems that there is some doubt about the animal being a wolf at all, while others claim that the creature was killed in New Hampshire, which is not difficult to understand when it is taken into consideration that the town of Fryeburg borders upon that State. But in order to investigate the wolf story still further the Maine Fish and Game Commissioners, who offered the special wolf bounty in that State, have been applied to. One of them writes:

"We have not as yet been called upon to pay a wolf bounty, neither do I much expect we shall be. There is always a stray panther or wolf reported in the forests of Maine, and probably with some degree of correctness. The time is past when either of these creatures can exist in any numbers in our forests, whatever may be the plentifulness of deer and other game, so great is the enterprise and competition among our fur hunters."

All of which goes to show that our position was not far out of the way.

Since the above was in type, and at the moment of going to press, we have received information from a gentleman well acquainted in Oxford county, Me., and perfectly reliable, that a wolf escaped from the collection of curiosities of a traveling showman a year ago last fall. The showman is an eccentric character, a resident of Oxford county. He had for several years a collection consisting of a black bear, a couple of Canada gray wolves, etc., which he was accustomed to exhibit at a side show at county fairs, and Fourth of July celebrations. When not on the road he kept his animals in a pen in his barn, and from this pen one of the wolves escaped. The exhibitor kept the matter still for a long time, fearing trouble, if the story of a live wolf astray should get out, but finally the truth became known some months after. It is pretty generally believed that the wolf killed in Fryeburg is none other than the tame one which had escaped.

FROM SHAWNEETOWN, ILL.—The winter was an exceedingly severe one, the thermometer going as low as 23° below zero, and fears were entertained that all small game would be frozen out. With some degree of interest, I have noticed the quail since the advent of spring and find them much more plentiful than could have been hoped earlier in the season. By inquiry among farmers and others I am informed that very few frozen birds were found after the hard weather of the earlier part of January. Squirrels are very plenty in the woods. On Saturday, while out ducking in the Wabash bottom, I noticed quite a number in the woods, although the ground was covered with from five to ten feet of water. During the exceeding high water in February the turkeys were all driven to the hills and, I am sorry to say, quite a number were slaughtered. Water fowl have been plentiful for a month past, but at present are fast wending their way northward. Mallards are pairing and will soon leave us. Saturday, March 22, I took a trip into what we call Hampton bottoms, on the Wabash, and ducks and geese were found in immense numbers. To the true lover of nature, life has no greater pleasures than when in the solitude of the woods. The air is filled with the resonant honk of hundreds of geese and the incessant quack of the wild ducks. There is a charm that seems to haunt his memory and bind him closer to the sports of the chase. While silently gliding through the thick timber of the inundated bottom lands the very air seemed alive with the wild commotion of the frightened fowl, as, rising upon every hand, they sped away upon frightened wing. I am pleased to say, however, that they all did not get away, as I had all I could possibly carry. Jack snipe are just coming in, and No. 10 shot will soon be in demand. By the time they disappear the young squirrels will be ready for shooting, and then the dogwoods will be in blossom, when the gun can be laid aside and some of the finest black bass that ever gladdened the heart of the angler will be ready to bite. In fact, I am already getting rods and lines ready—reels are of no use in this section, as the fishing grounds are so difficult to approach that nothing but a rod can be used. Last season I tried trolling faithfully, but could not succeed in hooking anything. Think I'll not try it this year. I will say before closing this that your articles on the most desirable gun for sportsmen's use are read with interest and are of real benefit to amateur sportsmen like—X.

THE BLACK HILLS SPORTSMAN'S CLUB.—A brief history of the organization of a sportsman's club in Deadwood, Dak., will interest many of your readers. It is by the efforts of clubs such as this one that game on the frontier is to be saved from extinction. A meeting was called for the purpose of organizing a sportsman's club in Deadwood, D. T., for Jan. 8, 1883, and was attended by the following gentlemen: Seth Bullock, W. M. Brewer, E. Butterfield, Porter Warner, Jas. Lawler, L. F. Whitbeck and John C. Ickes. A committee was appointed to draft and submit a constitution and by-laws at a meeting called for Jan. 11, 1883, at which time the club was organized, to be known as the "Black Hills Sportsman's Club." The club is said to have been tireless in its efforts to prevent the wanton destruction of game, out of season, and has secured the passage of wholesome laws by the Legislature to that end. Steps have been taken by the club for the introduction of quail with whose progeny to stock the Hills and surrounding country. The officers elected on Jan. 1 were as follows: Dr. L. F. Babcock, President; John Stannus, Vice-President; John J. Ickes, Treasurer. Board of Managers—Seth Bullock, E. G. Phillips and E. Butterfield. At present the club is composed of twenty-one effective members and fifteen honorary members; one from each of the journals published in the counties of Lawrence, Pennington and Custer.—STAMPS.

SIZE OF MEASURES.—"Hammerless" says that there is a difference of ten pellets between the Bridgeport and Dixon measure. I have a measure that, when it is set at the ounce notch, holds about six pellets of No. 5 shot over 1¼ ounces. The maker neglected to put his name on the measure. Another one, stamped "Bridgeport G. I. Co., 23 C. R.," when set at the 1¼ notch (there is no 1-ounce notch on it) holds eleven pellets less than 1⅛ ounces. Another, without stamp, is about correct. The measures were filled level full and the shot weighed on a postal balance. I said that I did not consider the shell chamber in the gun any benefit. I presume some of your readers will differ from me in that, but I would like to see the 12-gauge gun that will shoot stronger than mine. Bitter Root Bill says that his gun is chambered for 3-inch shells, but that it shoots as well with 2⅝ shells. Now if it shoots as well with a shell ⅝ of an inch shorter than the chamber, would it not shoot as well (or better) without any chamber? It appears to me it would.—GREEN WING (Freestone, Cal., March 20).

A NEW GUN CLUB.—The Independent Rod and Gun Club, of Rochester, N. Y., was organized March 25, 1884. Its object is to protect fish and game and the promotion of legitimate sport with the rod and gun. Officers for the ensuing six months are: President, H. Ritter; Vice-President, J. G. Zimber; Secretary, T. J. Zimber; Treasurer, J. C. Enders; Executive Committee, C. L. Harris, J. Long, T. J. Zimber; Vigilance Committee, J. Nouch, W. G. Weston, J. G. Zimber.

SUMMER SHOOTING.—In your issue of March 20, "16-Bore," of Madison, N. J., under the head of "Summer Woodcock Shooting," makes some statements to which we take exceptions. It must be very tame sport, indeed, in New Jersey, if his views are correct. With ten years "constant in season" woodcock shooting in this vicinity we must say that our experience is decidedly different from "16-Bore's." The season here opens July 4, and if the Jerseyman will come and make us a visit about that time we think that we can demonstrate to him that it requires something more than a mere boy to "catch on" to even a bare majority of the birds flushed. In all of our experience we have never seen a single woodcock (after July 4) that could not get out of as small a hole, and do it as quickly as anything clothed in feathers. We have very fine partridge and quail shooting, but the woodcock is king of them all, and the hardest by far to bag. —PEDRO (Mehalson, Pa.).

SLAUGHTER.—Mr. Francis Burritt, of South Norwalk, has been going for the ducks in a remarkable manner this spring. His first shot resulted in bringing to bag twenty-eight broadbills; the second shot twenty-seven broadbills; and the third shot thirty-eight broadbills. These shots were made with a twelve-pound double eight-bore, with six drams of Hazard No. 5 duck, and 1¼ ounces No. 5 shot. The birds were plenty, and he sculled on to them, and fired both barrels with the above results. This only includes the birds that he picked up dead, of course, some cripples getting away. Last year he made another shot at old squaws, off Beaufort, Conn., killing fifty (50), having used a single four-bore at them sitting, and a double eight as they rose. He picked up fifty dead, and many wounded escaped. We do not think this shooting has been beaten recently.—FOUR-BORE.

BIRDS IN MARYLAND.—Snipe shooting has commenced in this section. As early as March 24, R. Cantler shot one snipe in Anne Arundel county, Md., and on March 30, he made a bag of six snipe in Baltimore county. Blackheads and sprigtail ducks have made their appearance on the Patapsco River. I saw several coveys of partridges close to the city the last few days, and if they are not disturbed by the market gunner, sportsmen may expect good shooting close to the city this fall. There have been woodcock shot this spring to supply the demand of the taxidermists, the killing of which is against the law. But as long as they can be sold for a good price, those shooting for gain will continue to violate the law and destroy the birds.—AMATEUR (Baltimore, Md., April 2).

BIRDS IN OHIO.—Quail wintered pretty well here, the pheasants a little better. I found a few dead birds in the field that had been frozen and starved to death. Ducks are abundant here, fishing is fine also. I am getting Hon. H. C. Greim, a representative, to try and help our game law through. That will protect the game when shooting seasons are over, it also forbids trapping birds and selling them. Let us hear from some other young sportsmen in the future.—YOUNG SPORTSMAN (Somerset, O., March 25).

NEW JERSEY NOTES.—Quail seems to be very scarce in this section of the State, notwithstanding the efforts of the game society we have here, who annually stock their leased ground. I was out with my dog last Sunday for a walk and put up two woodcock, but they were very wild. I also ran into a flock of upland plover. Robins are quite numerous. Mr. Willis, the champion quail raiser, has an addition to his feathered pets in the shape of two imported pheasants.—DASH (Westfield, N. J., March 27).

PENNSYLVANIA NOTES.—Game wintered well in this section, for although we had a great deal of snow, there was little drifting, and no sleet or freezing rains. I flushed seven English snipe the other morning near town and, on the 20th ult., saw the first woodcock of the season. Trouting season opened on Tuesday, 1st inst., with a general rush to the streams, and although it is cold and stormy, some pretty good catches have been made.—T. E. D. (Hollidaysburgh, April 3).

Camp Fire Flickerings.

"That reminds me."

108.

THE late Dr. John R. Curd was a native of Goochland county, Virginia, and possessed a talent for fiction which gave him a broad reputation.

At a dinner party he related the following incident in connection with his experience as a high private in the army of Northern Virginia.

"I was attached to a battery at the battle of Gettysburg, and in the fierce cannonade which preceded Pickett's charge, every man, except me, in my detachment, was killed. But although left alone, I did not desert my post; and long after the shattered remains of Pickett's division had returned to the Confederate lines, I continued to fire grape into the masses of the enemy on the opposite ridge. While I was ramming down the last charge, General Robert E. Lee galloped up and cried, 'Curd, cease firing; let there be an end to this bloodshed.' But I said to him, 'General, I have but one charge left; let me give them this.' Overwhelmed by his emotions the noble Lee sprang from his horse, seized my hand, and with tears in his eyes exclaimed, 'Dr. Curd, henceforth do not call me General, but call me Bob!'"

NORTHSIDE.

109.

In a recent visit to Adironda I had the pleasure of calling on your occasional contributor, Major Joseph Verity, U. S. H. M. I found the veteran hale and well and full of reminiscences of the past, which he freely discoursed of. Early in the conversation he spoke of his first and second wives and his children, but later on, when I spoke of something concerning domestic relations, I think it was of wives sometimes objecting to their husbands going fishing and shooting, he said that he "was not competent to give an opinion in such matters, having lived a bachelor all his days."

"Why, Major!" said I, in some astonishment, "if I understood you aright you were telling me not long ago of your wife and children." (I was afraid to venture on more than one wife).

"Was I?" said he, and then after a short pause he added, with great dignity of manner, "Well, sir, it cannot be expected of one of my years that he should remember every little thing that has happened to him in the course of a long and somewhat eventful life." AWAHSOOSE.

Sea and River Fishing.

ROD MAKING.

Editor Forest and Stream:

Several times I have noticed items in your paper, and one in last issue signed "W. K.," recommending swelled or over-capped ferrules which he says gets the full size of the wood. I would like to have some one tell me what advantage there is in using such ferrules; most of us rod makers of late years in making a light rod would not think of letting in the ferrules flush with the wood. We turn the ferrules at the end so as to make a nice finish, at the same time making it a little thinner and place a wrapping of silk next, which, when finished, makes the work complete. But it is claimed that it makes the rod stronger. Suppose we were going to use for a fly-rod No. 3 swelled or over-capped ferrules for first, and No. 0 for the last joint; it makes a rod which is really No. 4 and No. 1, which is just one size larger than No. 3 and No. 0 straight ferrules. Again suppose we take a swelled ferrule which is size of No. 3 at large end, and compare its size with No. 3 straight ferrule; we find it is just one size smaller where the male ferrule enters and the same size at the other ends. Now, where is there anything gained? The swelled ferrules cost more and it is more work to fit them on. I use them on some rods because they are ordered so, but consider them, like the dowels, of no use whatever.

When I make a rod and use swelled ferrules, I use just one size smaller ferrules than I would in using straight ferrules to get same sized rod.

The fact is we follow too faithfully in the old rut, and it is high time that such gentlemen as Mr. Wells should stir us fellows up, and we should help them to get the wool off our eyes and to benefit ourselves and customers. E. M. E.

Hancock, N. Y., March 28.

Editor Forest and Stream:

I have been much interested in the recent discussion in the columns of Forest and Stream concerning the use of dowel pins in fishing rods, and would like to add my mite for the benefit of my fellow anglers, although I fear the subject has been already so ably and thoroughly exhausted by Mr. Henry P. Wells that my remarks will prove superfluous.

Nearly thirteen years' experience as an amateur rod maker has satisfied me of the soundness of Mr. Wells's views in regard to dowel pins. During that period I have made about thirty rods of various descriptions for my friends, and since my first attempt I have abandoned the use of dowel pins, which, as Mr. Wells correctly states, not only serve to weaken a rod unnecessarily, but add to the angler's perplexities when so unfortunate as to break his only rod while on the stream where the fish are biting freely, and possibly not another rod is to be obtained within a distance of forty miles. An instance of this came under my observation while bass fishing last fall.

While engaged in the manufacture of my first fly-rod I was so fortunate as to make the acquaintance of the lamented "Uncle Thad" Norris; this resulted in a correspondence, which was only terminated by his death. To him I am indebted for many little kinks in rod making, for he had, as he expressed it, "an abiding sympathy for amateur rod makers," and was always ready to extend a helping hand to tyros like myself, and share with others the stores of knowledge acquired by him during an experience extending through the many years of his useful life. He early pointed out to me the abomination of the dowel pin; the weakening effect of the pins so generally employed to fasten on ferrules, also another fruitful source of broken rods, namely: making shoulders in the wood when fitting on ferrules—this latter method has to my mind even a far greater weakening effect than the dowel pin. In nearly every instance of a broken rod which has come under my observation, the fracture occurred just at the junction of the female ferrule with the wood.

I approach the subject of tapered ferrules with some trepidation, but agree in the main with Mr. Wells. Straight ferrules are undoubtedly the best if they cannot be had properly tapered. If properly made the female ferrule should taper very slightly from both ends to the center. This is accomplished by stretching the end into which the male ferrule fits over a tapered mandrel; the male ferrule will then fit snugly the whole length of its insertion, and as the metal becomes worn, enters deeper and deeper, thus taking up all wear. Norris thus made his ferrules, and since commencing this article, I have examined my old fly-rod made by him, and used by me for nearly nine seasons, and cannot detect the least looseness or shakiness in the ferrules, which fit as tightly as when first made. During nearly thirteen years experience in fly-fishing, both for trout and bass, I have seldom had my rods throw apart, and am convinced that on every occasion where such mishap occurred, the fault was due mainly to my own carelessness in not properly jointing the rod. Unless unnecessary force is employed in casting the fly, I don't see how a reasonably well jointed rod can be thrown apart.

By the way, will some of your readers furnish me a recipe for making a good stick cement for fastening ferrules, or inform me where it can be bought. Norris used to supply me, but since his death I have made numberless experiments trying to make something like his, but the results have been unsatisfactory. Latterly I have been using a mixture of liquid shellac and powdered quartz, yet while this preparation appears to hold well, it would be rather inconvenient to take along on a fishing trip. G. A. Brandt.

Washington, D. C., April 1, 1884.

Editor Forest and Stream:

If Mr. Brandt will make his ferrules fit the joint reasonably well, and then proceed as follows, it is confidently believed the result will be satisfactory:

Warm the end of the joint and cover it evenly with gutta-percha gum, distributing it as it melts with a stick for this purpose; warm the ferrule, place a small piece of the gum inside, and move it about in like manner until the inside is coated. Then warm both joint and ferrule, and push into place with a twisting motion. This gum will be found to melt at a low temperature, to be extremely adhesive, and it is believed is sufficiently elastic to defy time or any other contingency, except heat, to loosen its hold.

For twelve years or more, off and on, I have experimented with ferrule cements, and though several were found which answered well, all left something to be desired. Some experiments in another direction required the use of gutta-percha gum, and while manipulating it I was at once struck with its unequalled adaptability to the purpose under discussion.

The theoretically perfect ferrule cement resembles the theoretically perfect knot, in that while it should hold forever if desired, it still may be loosened at any time with the utmost ease.

This discovery, if discovery it is, is too recent to have as yet undergone the crucial test of protracted use and abuse. But as far as a limited lapse of time, and considerable experience in the behavior of other cements, will warrant the formation of an opinion, it is confidently believed that this is the ferrule cement of the future, and that it fully meets and equals every requirement of the theory.

In all that I have written on the subject of fly-fishing appliances, and in all that I may hereafter write, but one end and object has been and will be in view—the improvement of the art. I hope to see the day when the dowel will at least be the exception rather than the rule; when a detached handle will be of almost universal use; when the fastening-pin and cements which necessitate that a broken end shall be burned out of the ferrule, will all be things of the past.

Every September for years past I have had to keep a Maine camp full of anglers in repair. This is a labor of love, of course, as it is to every true angler to aid another. I mention this, that your readers may see that sufficient experience has been had of the various accidents to which anglers are liable, to justify an expression of opinion. And no opinion that I have so formed rests, I believe, on so solid a foundation of fact as the objections and recommendation of the preceding paragraph.

Gutta-percha gum may easily be had of any dentist in sufficient quantity to fasten a set of ferrules, but if Mr. Brandt will send me his address, I will gladly mail him some.

Or some of that cement may be procured at any shoemaker's, which they use to paste waterproof patches on shoes. This generally, if not invariably, consists of this gum dissolved in carbon bi-sulphide. It is a thick brownish liquid. But of all the vile smelling compounds that the ingenuity of man has yet been able to devise, this solvent caps the climax. Therefore, unless prepared to defy an attack from a mob, it is not wise to use it in the near neighborhood of others.

Not only is it believed that this gum will fill every requirement as a ferrule cement, but an equal degree of confidence (based, however, less on experience than on theory) is felt that it will prove invaluable in emergent repairs, as a means of coating and uniting such splices as are employed to mend broken joints. Its extreme adhesiveness, its utter indifference to moisture, and its ready fusibility, seem to render it peculiarly suited to this purpose—far more so than the shoemaker's wax usually employed for the purpose.

To such as may desire to thus fasten their ferrules, the following procedure is recommended. Mark the distance to which the joint is to enter the ferrule. There wrap on tightly a strip of writing paper about three-quarters of an inch wide, and secure the outer end with mucilage or flour paste, that it may not unwind. Set the ferrule as before directed. Some of the gum will be crowded before it, which may be removed with a knife, wetted to prevent sticking, and set aside for future use. Then heat till the residue is fluid, and wipe off clean with a rag. Finally remove the paper, and the job is complete.

Mr. Brandt's remarks in reference to the hour-glass conformation of the bore of a female ferrule merit and receive my thanks, for they call to my attention an oversight in my comments on the dowel pin, of no little importance. In his skilled hands doubtless this may work well; but it is a principle of construction which must be handled with singular discretion.

Let us analyze this for a moment. The hour-glass conformation we understand to be that, in which the inner diameter of the female ferrule diminishes from both ends toward the middle. Of course, the male ferrule is tapered to conform. Now here we have a portion of a cone entering a conical hole. It is obvious that this cone may enter some distance before it is at all in contact with the sides of its socket; or in other words, before there is any fit at all. It is also plain that when contact does occur, very slight additional advance of the cone wedges it fast, and it can enter no further. Therefore, the limits within which the fit lies are very narrow. On one side and almost in contact lies the "jam," where further inward motion is brought to a stand; on the other side, and in almost equally close juxtaposition, is a point where the contact and consequent friction (or, in other words, the cohesion of the surfaces) is very slight. Now it is this frictional cohesion alone which prevents the rod from throwing apart.

Have any of your readers ever endeavored to loosen a stubborn glass stopper from a bottle? Here we have the conditions exactly reproduced—a cone fitting within a tapered bore. Holding the bottle in the left hand and constantly turning it, each side of the glass stopper is tapped in alternation with any light metal body, and in a moment an adhesion which defied all the torsional strain you could apply, is broken, and the stopper may easily be removed with the thumb and finger.

And just here, and in ignorance or neglect of these simple and elementary principles, lies the foundation of the constantly recurring charge that the dowelless ferrule will throw apart. Give to such a ferrule, if constructed on the hour-glass plan, any sudden shock or jar, start it ever so little, and the cohesion of the surfaces is so impaired that, if the next cast does not overcome this altogether, it at all events loosens it still more, until the joint throws apart, and the angler lifts up his voice in such remarks as he deems appropriate to the occasion.

Now let us contrast the action of a true cylinder. Enter one-eighth of an inch and it fits—enter it another eighth; it still fits, and the cohesion of the second is added to first—a third, and with like result, and so on, till it has entered to its limit, still fitting at each fraction of advance, and still constantly adding a due proportion of cohesion to that already obtained. Start this ferrule intentionally a quarter of an inch—yes, even half an inch, and still, if the fit is tolerably good, you have cohesion more than sufficient to meet and overcome the tendency of the joint to throw apart, and thus, as has been demonstrated by years of use by my friends and self, as well as it would appear from your columns by many another angler, this most aggravating mishap may be altogether prevented.

Therefore it would seem that by no means should that end of the female ferrule which is to receive its mate be enlarged upon a tapered mandrel, but on the contrary, the bore of that part should be as true a cylinder as possible. If doubt of the fit is still felt, the following course is recommended: Stretch the male ferrule on a cylindrical mandrel, if it be too small; then cement it and its mate each on a stick to serve as a handle, and grind them together with flour, emery and oil. In doing this be not content with simply twisting them around, the male within the female ferrule, but try to combine to some extent the reciprocating motion of the piston of a steam engine, and this not only to insure a more even distribution of the emery, but that the grinding may be uniform and not in rings. To trained mechanics other abrading powders preferable to emery will suggest themselves. But it is to be remembered that the ferrules of a fly-rod bear little analogy to the bearings of a running machine, since the sum of all the motion communicated to the ferrules by jointing and unjointing the rod in many years would fall far short of that made by such a machine in a very few minutes. Flour emery is everywhere to be had, and is, therefore, all things considered, the most available for our purpose.

With the aid of a lathe this fitting becomes a matter of very trifling difficulty. Provided with a round stick armed with No. 0 emery cloth, glued upon it, and of a size just to enter the female ferrule, the latter is chucked in the lathe. While revolving at a rate of speed as high as the lathe will give, the stick is introduced well oiled, and while the ferrule revolves, the stick is moved constantly inward and outward. A very few minutes suffices. Then the male ferrule can be readily fitted, while itself revolving in the lathe, with a "dead smooth" file, supplemented by emery cloth and oil.

Since the grinding-stick is thus constantly reciprocated during this process, it is clear that while at the mouth of the ferrule the abrasion is continuous, it is intermittent within; and that this necessarily enlarges the mouth more than inner portions of the bore. But the difference is almost infinitesimal, and that it should be confined to the least possible quantity, the grinding should be continued for but two or three minutes at most.

Thus from the tubing described in your issue of March 27, I can make and fit the ferrules for a rod, including a handle-ferrule, one butt, two middle joints, and two tips, in not to exceed three-quarters of an hour. I have tested them with severity for years, and I know they will work in every particular to leave nothing to be desired. Henry P. Wells.

VIOLATIONS OF THE FISH LAWS.

THE Buffalo *Courier* says, in speaking of the work of Game Protector Stephen A. Roberts, of that city:

"The first official act of Mr. Roberts was the taking and destroying of eight large nets found set in American waters of Niagara River early last fall. The owners of the nets watched the proceeding from hiding places along the river banks, but made no open opposition to the sacrifice of their property by the game protector and his allies. Loss of their nets is deemed infinitely more disastrous by the piscatorial law-breakers than the being detected and indicted. The former punishment means the loss of valuable nets, besides the possible punitive penalty imposed by the court for the offense in case the name of the owner of the nets is learned by the public prosecutor or game protector. It may be news to many of our citizens to learn that all fishing with nets, except for minnows, is positively prohibited in the American waters of Niagara River at all seasons, and that it is an offense under the same statute to have in possession either black or striped bass weighing less than one-half pound at any time. Snaring with pound nets in Lake Erie and Ontario is forbidden at all seasons. Mr. Roberts said to a *Courier* reporter: 'The opposition to my authority is very strong, especially about Buffalo. The men who subsist here from the fisheries are mostly idle fellows, too lazy to work, and just sufficiently adventurous to love violations of the law for the very sake of the excitement. Several of them are desperate fellows who have served terms in the penetentiary and who literally poach for a living. When I first entered upon my duties these men committed open violation, claiming that the fish they seared were of Canadian parentage, but they found out their mistake. Last fall I used to go out at night in boats and make a regular patrol of likely spots for nets. A policeman from the nearest station-house would usually accompany me, and we often found what we sought and without opposition could destroy the nets. During the winter I have been in the habit of visiting the river banks to watch operations. Now, however, I shall begin my water patrol systematically, and enforce the law strictly. I intend to exercise my authority to the fullest, although I am almost alone in my attempts. Citizens are not disposed to help me and even put obstacles in the way of my success. Even the sporting clubs of this city extend no helping hand to me in my effort to punish violations of the game laws. One might naturally suppose that these organizations would be disposed to come forward and aid me, even to the extent of offering rewards for the detection of offenders, but they show no disposition to second my efforts in any direction. Already this season the poachers are thoroughly organized. They go off in boats and have sentries posted along the shore to warn them. When they have set their nets they go ashore and leave them over night or until early morning, setting a watch on shore to keep guard over their nets. If they see me coming in my boat, they shoot out from cover in a light skiff, cut the lines, and so I lose the chance of getting both net and culprits. There is no man in the State fonder of hunting and fishing than I am, and for that very reason, if for no other, I am determined to press poachers. Only I want the co-operation of the officers of the law and of the people generally. What good is it to have a man indicted if he can pay a trivial fine and repeat his offense under my very nose, defiantly? None at all. My duties are hard enough, but I mean to discharge them to the very best of my ability, and earn my money while I hold my place. There are things about the game laws I should like, as a sportsman, to see changed. The present open season is from May 20 to Jan. 1, and this is wrong, because, you see, these fish do not begin to spawn here until between the 12th and 15th of June, when they seek the shallow waters of the river sides and can be readily snared. If the season was not declared open until July 1 the spawning would be over and the fish swimming in mid-stream, safe from all but anglers. I have conferred with Mr. Sherman of the board, who has promised to have the matter brought up before the game committee in the Legislature. I hope some action will result from it. I am devoting my whole time to my keepership, and shall devote my days with equal impartiality to the poachers who shoot and the poachers who fish and snare. I shall have my hands full, at any rate. In August, when the woodcock season sets in, the destruction of hen partridge and their young will also be inaugurated, and I shall bring sportsmen of all shades of culture to the undiscriminating bar of, it is hoped, even-handed justice. Didn't know it was loaded"

won't do if I hear of a young and uprotected partridge being knocked out by a guileless sportsman. Well, good day, I have a trio of names of offenders before the grand jury and I must go over to the hall. You might say, if you will, that all complaints directed to me at 56 Cottage street will receive prompt attention. Good day;' and the keeper of his excellency's preserves and preserver of the game and dignity of the commonwealth turned away, and the stone figure of justice on the city hall tower seemed to smile on him as he bent his steps toward the building."

At Swanton, Vt., there has been a fight with the poachers on Missisquoi Bay. Our correspondent, "Snip Snap," sends us a clipping from the Burlington *Free Press*, and says that it is the intention to enforce the laws although it is difficult to get a conviction in Vermont. The article details a fight with clubs, axes and pistols, and concludes by saying:

"The prisoners secured were two brothers named Nat and Joseph Sheets and Joseph Couture. The officers looked around and discovered three or four barrels of fish of excellent quality, caught that morning, which the fishers were prepared to ship to New York. The prisoners and the two large nets which were taken were loaded into the wagon and the officers started out on their return trip. As there was room in the wagon for only a part of their number, Sheriffs Barton and Atherton and Officer Dumas walked to Swanton, a distance of seven miles. The prisoners were taken to St. Albans where a complaint was entered against them for resisting the officers of the law, and in default of bail in the sum of $250 each, they were committed to jail in that place. The State attorney at St. Albans has taken the case in hand and the offenders will undoubtedly receive a lesson that they and their partners in guilt will long remember."

Editor Forest and Stream:

I am very glad to see that there is some one who will say a word against the slaughter of the fish in the western part of Vermont. It seems too bad that there should be so much illegal fishing of our lakes, and even in the small streams, where a few trout can be taken in the proper season. As it is now, there are a certain few who go fishing, and what fish they cannot catch with hook and line, they will take by nets and make a clean scoop as far as they go. In some of the trout brooks instances have been known of lime being thrown into the streams, which destroyed all of the fish that came in contact with it. No notice is taken of any of these acts, although there is a so-called fish protective society in the place. The same thing happens also in our beautiful Lake Bomoseen, where there are both large and small mouthed bass, pickerel, perch, sunfish, bullheads, suckers, and a small fish called the whitefish. The illegal fishing is carried on during the whole season. As soon as the ice is out of the above mentioned lake, spearing is commenced, and on any night during the spring that is suitable for spearing, can be seen from three or four up to a dozen boats. The writer has seen as many as thirteen jacks out at one time in one evening, and from then until the lake is frozen over netting is carried on. The nets used are mostly gill nets. It is a common occurrence in a certain locality to see the nets spread out on the grass or around the porches, drying. It is plain to be seen that such work is spoiling all hook and line fishing. Now it is hardly possible for a person to catch with a hook and line a decent mess of fish, where a few years ago it could be readily done. It seems too bad, that as long as we have a very stringent law against all such illegal fishing, there cannot be found some one who has the pluck to put a stop to such work.

The aforementioned fish protective society appointed certain men to prosecute all such offenders; but there has not been one single instance of any of the offenders being brought to justice. As this lake has become quite a prominent place for summer visitors, it seems to me this illegal fishing ought to be stopped. Such is the wish of one of the citizens of the place. Snap Shot 6.

Castleton, Vt., March 31.

LENGTH AND WEIGHT OF FLY-RODS.

Editor Forest and Stream:

The importance of selecting and using the right kind of a fly-rod is so great that I wish to indorse the article written by "Onondaga II.," in your issue of March 27. I do not know the writer, but he must be a master workman at the gentle art to handle the subject so well.

Twenty years' experience at fly-fishing has convinced me that a good split bamboo from eleven to eleven and one-half feet long, from nine to ten ounces in weight, and properly balanced, which means much, is the safest rod that can be used, except for brook-fishing or very small trout. The advantages of such a rod over a light and short one are: It will stand harder usage, is quicker killing, will make longer casts, and at the same time possess all the virtues that are claimed for a light, short rod.

On my second trip to the Rangeley Lakes I was taught a lesson never to be forgotten. I had whipped the water from twenty to forty feet below me with a light rod and three flies attached to a short leader for half an hour, and walked away in disgust, when a stranger to me quickly stepped on to the rock I had just left. He was armed with a ten-ounce split bamboo of the latest pattern. A short movement of the forearm, a gentle turn of the wrist, and the two flies went bounding outward and upward and at last dropping on the water like thistle down. Only a few casts, and they landed sixty feet away, and as they touched the water so deftly, a mighty swirl, a splash, and a five-pound trout that I had driven down the river was hooked and scientifically killed. I stood and watched him handle that rod until three trout, weighing nearly twelve pounds, were taken in that one place. I lost my trout, but the lesson learned was the best one and the only one I ever needed.

Since that time I have done the same kind of work for some hurrying, over-anxious nimrod who was apparently driving oxen instead of fly-fishing.

The point that "Onondaga II." makes is a good one where he says: "Such a rod will carry the flies to the full limit of its strength, and at the end of a taut line, accurately and softly."

One thing to be observed in selecting a rod is to not get a too slim or limber one. I have two objects in writing these few lines. The first is to show "Onondaga II." that there are some of the Forest and Stream's readers who appreciate his article, and the other reason is to benefit some one of less experience in the craft in selecting and using a fly-rod. E. T. W

Putnam, Conn., March 31.

FISHES AND FISHERMEN.

SOME are born to greatness, some are born to wealth. Others come into the world and must needs work their way to fame and fortune. Whether a fisherman is born to always have good luck, I doubt, but I do not doubt the truism, that all lucky fishermen had it bred and born in their bones, as sure as the son of a king is natural heir to a throne.

I was born on Friday, therefore must expect some bad luck in my time, as in the past it has come to me, one way and another. I was brought to first see the light of my existence in Bradford county, Pa., near the mouth of the Wyalusing Creek, and spent my boyhood, or halcyon days, by the side of a rippling brook that ran through my father's farm upon the banks of the beautiful Susquehanna River, whose silent waters flowed past our very door. The lofty mountain that lifted its giant head on the opposite shore, cast its shadow every morning at our feet, and has a charm for me that no other spot on earth has. The old crooked river is mapped in my memory, though for thirty years I have become acquainted with new faces and strange waters. Now for our vacation of 1883.

At the time of my first bout at sailing, I was a resident of the thriving inland city of Syracuse. Whether it was for the purpose of getting a huge joke on me, or for the purpose of allowing me to spend some jolly days with a few jolly Elmira boys, I will leave the reader to judge when my tale has been told.

Two years ago this coming summer, in July, I found my friends awaiting me at the depot in Elmira. All preparations had been made and a large flat boat was anchored in the Chemung below the road bridge. It had been well built by my brothers, Dr. C. W. Brown and T. F. Brown, residents of Church street and College avenue. It was 20 feet in length and some 10 feet wide, with 12-inch sides, braced on the bottom with 2x4 scantling; a staunch craft, with a large cabin, with upper and lower berths. Our stock of provisions, fire-works, guns and ammunition were in great abundance. The fire-works consisted of rockets, Roman candles, wheels and crackers, all the gift of our genial companion, Attorney-at-law Swartz. He had a fine voice, and could enchant any crowd with his melodious strains.

Our company was made up of two Browns beside myself; Legal Swartz, captain or conductor of pyrotechnics; Dr. C. W. Brown, captainisimo and general superintendent of motion; Rev. Manly S. Hard, chaplain and professor of good order; W. H. Willson, of Ithaca, N. Y., a contributor to Forest and Stream and the possessor of the largest shoes of any man in the party; Mr. Copeland, champion bass eater; one of the editors of the Elmira *Daily Advertiser*, the taker of notes, etc. Several other gentlemen went on board with us, who acted as sailors. The writer was dubbed the cornetist, he unfortunately having taken his horn along, the echoes of which may still be reverberating, for all I know, from rock to rock up and down the ravines of Sheshequin or Sugar Run.

It was Sabbath night, and we all trying to be patient for the dawn of the morning. Our craft had been loaded, and everything was ready to lift anchor when the midnight hour should have past. The hours dragged slowly on, our sleep having been dreamy and fitful enough to produce hysteria in a woman and hypochondriasis in any man but a born fisherman.

The night was pitch dark when we left the dock and pulled out with a stiff wind blowing great guns.

The river was low, and we were obliged to use an ash breeze to get on at all. It was broad daylight, and the sky overcast with clouds, before we had proceeded down the Chemung three miles. At this slow rate we could not expect to reach Athens, Pa., before midnight. At about 12 M. we landed on an island, where we found a large encampment of Elmirians—ladies and children principally—the happiest lot we ever met. Their camp was called Wyckoff, and a neater place one must go to the tropics to find. Grand old elms and beautiful buttonwoods cast their shadows over camp and field.

The chirping of birds and the merry laugh of the children, combined with the musical voices of Rev. Hard and Attorney Swartz as they chatted with the ladies, completed the charming scene. We remained but a short half hour to rest from our pull against the wind, and to allow our captain, Dr. C. W. B., to get more breath, to enable him to call lustily to the oarsmen for more motion during the rest of the day before us.

From Camp Wyckoff we sailed for Chemung. Before reaching this hamlet, nestled at the foot of a mountain,, we must needs pass "Johnny Cake Dam." This spot in the Chemung none of us will will ever forget. We called it the worst dam that ever dammed a stream. The sequel will show why. My brother and the writer had a skiff and went ahead of the large boat to prospect. We heard the roar of the water ahead of us, and felt the current sucking our boat fairly from under our feet. We were standing up looking at the torrent of rushing water as it sped through the old timbers and piles of the ragged remains of the defunct dam. Nearer and nearer our trembling skiff approached the terrible place, in spite of our efforts to pull into safe quarters. We now gave up all effort to save our going over into the whirlpool, and prepared ourselves as best we could to meet the shock. As serious as was our situation, Swartz and Rev. Hard laughed to see our frantic efforts to use our oars to conduct the boat into a space that might possibly allow our little craft a clear passage between some of the numerous piles, sticking their ugly heads above the water.

At this moment we struck. I went through the air like a rocket, some twenty feet, fish-rod in hand, and landed upon the seething waves, and went under of course. Fortunately, the place I struck was a shallow one, and my feet touched bottom. I braced and struggled against the awful current, but could only hold my own. I felt something entangling my legs; I felt for it, and grasped one of our trolling lines. I pulled upon it, and found it was fast to the boat, which had gone down between the piles. I was thus enabled to pull myself to the skiff in the space of a few minutes. The eddy formed by the lodging of our craft made it possible for me to stand neck deep in the stream.

My brother was fastened by one leg between the boat and a log. I felt great alarm for him, but was soon relieved by his good fortune to disengage himself by an herculean effort. There we were, out in a cauldron (as it were), being furiously washed and swayed by the crushing, foaming water, not knowing how soon we might lose our footing and be swept down to death.

The situation was becoming extremely alarming. Our friends saw the plight we were in, and jumped from their big boat and ran down the beach to try and save us. My brother put his hand to his pocket and found his money just about to pass out into the current. I also looked after my wealth, and was just in time to save it also. We were but about twenty feet from a little island, and on this we threw our cash and it was secured by our friends.

Our oarsmen—two as brave men as I ever met—took a rope and cast it to us, which we caught and fastened to a pile, and the shore end was manned by five of the crew, and thus we were saved from a watery and untimely grave.

I was now reminded of a lost creel and fish, a lost coat, fish-rods broken and useless, a lost fly-book worth $20, the rod worth $25 with line and broken reel, all my trolling lines and spoons lost, tangled or broken, and our hides wet as a washerwoman's dress. In trying to get our boat loose, we broke it to pieces, and thus lost $25 more. Rather an expensive trip for the first day of our journey. In the "wee sma'" hours of the night we anchored under the great iron railroad bridge of the Lehigh Valley, at Athens. We took a midnight supper at mine host Rice's hotel, and went to bed with our boots on, and slept well, after one of the most eventful and hard day's work of a lifetime.

I neglected to mention that we were some three hours or more getting our large craft over a sluiceway to the east of the dam, and on our way toward Athens we found my creel on a shoal, more than two miles from where we had our great struggle in that dam site.

When we left Athens, at 8 o'clock A. M., the wind was still blowing, and the skies betokened showers. We now entered the broad and tortuous Susquehanna and put out our fishing lines, with bait and spoons, which we had replenished at Athens. We took fifteen wall-eyed pike and a goodly number of black bass before we reached Towanda, some twenty miles from the place of starting at the railroad bridge.

At Milan we stopped for dinner, and such a dinner hungry and wet fishermen seldom sit down to.

Oh, how it did pour when we landed and while our dinner was being prepared. It seemed as if the heavens were let loose, and to add to our distress, we saw the river, so beautifully clear in the morning, now beginning to darken with mud. Like true braves and jolly tars, however, we sat down to fried pike and sweet and Irish patatoes, black raspberries, fresh picked, fricasseed chickens, lovely white bread and the sweetest of butter, coffee and tea of the best flavor, also such milk as only can be had at a country hotel. Talk about eating and clearing a table; talk of a flock of wolves in a sheep fold; expatiate on a hawk swooping down upon a brood of chickens, and then consider the wreck made of that dinner, and you will have reached the climax of destruction of viands. Not a cake, a pie, a chicken, or fish was left outside of us. After the rain ceased to pour we all went to dig fish worms, which seemed to be the best bait for pike and bass that day. We had small, strong spoons, with red and white feathers covering the hooks, whirlers; three hooks which we loaded with worms, a wad of the squirmers, most tempting in lakes or rivers for wall-eyed or glass-eyed pike. No angler should go after these fish without the worms and the spoons I have described. They are the boss for summer fishing.

The best pike fishing I ever had in any river is the Susquehanna at Milan, and at the mouth of Towenda Creek, and at Wyalusing. The best lake for fishes is Onida; though they abound in great numbers in Onondaga Lake, where they are often taken with a fly.

When we reached the long streak of still water above Towanda, we took several of the largest pike of the day. Here friend Swartz sent up a few rockets, and we fired several rounds of cartridges from our fowling-pieces to let the citizens of the town know of the approach of the jolly pirates. It still rained, and we all housed as soon as we could in the Ward House, kept by Col. Jordan. In the evening we had a host of friends and some curiosity seekers call upon us. Rev. Mr. Hard and Swartz gave a display of fireworks that elicited great applause from the company, and especially from the crowd that congregated on the streets. The evening passed too quickly, for it was one of the pleasantest often enjoyed. The following morning we found the river swollen and quite roily. We had poor luck fishing, but made a quicker passage to Wyalusing on account of the high water.

After coming to anchor at Well's Ferry, Capt. Brown arrayed the company in military order, the guns and fish-rods to shoulder, and with martial music we marched two by two to the Wyalusing House, kept by J. M. Brown, where we rendezvouzed for a week, and enjoyed ourselves as only such a wide awake party can. Day after day we picnicked our sweethearts and better halves, having met us there by rail. We fished and banqueted by day and by night, and every hour was full of pleasure.

One day while fishing in Bennett's Eddy, I had a bite that raised me off my feet. Our boat was anchored, and I had out about fifty feet of line, baited with a young bullhead as long as one's index finger. The fish was a monster, and after I struck him, he took a bee line for the west shore. I could not check him in the least; on he went so rapidly, now heading up stream that all my line had run out, and I, bracing with both feet, this towing the stern of the boat against the current. What to do in this emergency I did not then know, I was so much excited. I soon found that one thing was sure, my line must part if I could not turn him. My eight-ounce fly-rod, split bamboo, was bent in a semi-circle and still on he went, never once slacking pace. Snap went my leader, and down I went in the bottom of the boat, the heaviest fish I ever had hold of was gone, and so was my strength and patience. Have you ever been in such a plight? If so, you know how to pity a brother angler.

The Susquehanna River is the most natural water for fish in the State. One shore is made of a mass of shelving rocks, the other is shallow, and gravel bottom, covered with a rank growth of eel grass. Here the young fish can live and thrive unmolested, while near them the male fish stand guard by night and by day till the gamy little fellows are large enough to shift for themselves. A resident of Wyalusing told me that he had seen two rods wide of the shoal water, along Bennett's Eddy, so alive with young black bass, that the water was kept constantly roily by their motion in it during spawning or hatching time.

There are millions of bass hatched out in this one long stretch of still water. This is only twenty-five minutes' ride from the hotel at Wyalusing and only ten minutes' walk from a lovely private boarding house at Browntown, kept by Theodore Brown, where the best of board and the neatest of sleeping rooms can be had for a dollar per day. Philadelphia people put up there and at Wyalusing every summer, and the fun they have would make a dyspeptic envious.

I have taken four-pound small-mouthed black bass right in front of Mr. Brown's boarding house, to which water one can go in three minutes. Boys and girls ten years old catch

twenty to thirty bass at this point in half a day. A lady caught one there while out with a party from Wilkesbarre and Harrisburg that weighed over four pounds. Dr. Scoville, of Wyalusing, caught large numbers last season that weighed four and five pounds each.

Every man who reads this article and wishes a good time let him go to Wyalusing or Brownton next summer. It will be well to engage rooms now for the month of July, as there may be such a rush as to make it an impossibility if put off too late.

We went home with renewed strength and bronzed faces and hands. We shall be there next season if we live.

M. M. Brown, M.D.

Ithaca, N. Y.

OPENING THE SEASON IN NEW HAMPSHIRE.

I HAD often read and pondered over the sketches of the opening day on trout fishing, but being fully aware of the uncertainty of the results on so bleak and generally stormy date as April 1, I had never ventured out. But this year I determined that if railroads were not blockaded by snowstorms I would go and have an opportunity to realize all there might be of sport or discomfort.

I went; and mark the favorable conditions: no black flies, no mosquitoes, no midges, and no ice needed to keep my fish. I had a good little catch, no such score of weights as given by the members of Long Island clubs, taken from their waters, but thirty good fish with a big one that weighed a pound, and all bright, beautiful and wild. Fifteen of these I brought home alive, and in my aquarium they attract the admiration of the multitude, and awaken the dormant love of the sport in the heart of the old timer as he gazes long and lovingly on them.

Listen: "Ah! Brook trout! beauties—wonder where they were caught? I thought I wouldn't do any fishing this year; but I guess I must take a week or so."

No. 2—"Hello, Jim; come over here. See that? Boss fish! I broke one of my best rods last year on a big one. I must be looking over my tackle; I haven't been feeling well all winter, and must get away early this season and have a long trip."

These expressions, together with the usual "Where did you catch them?" and "How many did you get?" "I wish I had been with you," etc., show how deep and universal is the love for the brook trout.

I have also to-day added to my family seven live trout from the famous Monadnock Lake, Dublin, N.H., the classification of which has again become an open question this winter. I have a fine opportunity to compare the two varieties (?) as to outward markings, but as specimens have recently been forwarded to Prof. Baird for a decision, I will for the present call them the "no name" trout. The people of that vicinity are justly proud of their beautiful lake and its fish, and as jealous of non-residents as they are proud; but before they again order off a fishing party I would suggest that at least one of the three wardens may be made aware of the change of close time from May 1 to April 1; for that old law of the date of 1879, which they carry about in their pockets and read over the heads of "the boys," won't count, and may get themselves into trouble. M.

Bromfield House, Boston.

Protection in New Jersey.—A meeting was held last evening in the law office of Senator Griggs for the purpose of forming an association which will look after the enforcement of the fish and game laws in this county. It is a well-known fact that fish have been illegally caught in the Passaic River and in the up-county lakes for some time, and that the laws governing the killing of game have also been violated in a most outrageous manner. The meeting last night was a very successful one, although a number of the prominent sportsmen of this city could not attend for private reasons. These will, however, join the movement at the next meeting. County Clerk William M. Smith was elected president, Charles A. Shriner secretary, and Henry Keenan warden. Posters were ordered printed and distributed, warning all violators of the law to cease their illegal practices. Another meeting for the purpose of forming a permanent organization will be held on Thursday of next week in Mr. Griggs's office. The work of the Association was mapped out last night. Individual members of the Association or persons not belonging to the Association, but interested in the protection of game and fish and the enforcement of the laws, will report to the secretary all violations of the law which come under their notice. An investigation will follow, and as soon as the necessary evidence has been collected the warden will make a complaint before some justice of the peace. Senator Griggs has offered his services in the prosecution of all cases, an offer which was gladly accepted by the Association. The Senator is one of the most enthusiastic sportsmen in the State, and by the prosecution of the violators of the law he will make a warm friend of every lover of the rod or gun in New Jersey. The Association proposes to prosecute vigorously every offender, and by so doing it is hoped to put a stop to all illegal methods of capturing game and fish.—*Paterson Press, March* 29.

Trouting on Long Island.—South Oyster Bay, April 2.—The trout season opened quite favorably here. Lakes and streams are numerous, and they all contain more or less trout. Mr. Stanley caught seven very nice trout, weighing 5½ pounds; Mr. Clinton only caught four, one of them weighing two pounds, and the others one pound each. Some of the other sportsmen did quite well also, but the rain to-day interfered with the fishing. The trout I speak of were caught in public streams and not in a preserve; taking that into consideration it is not so bad. There were as usual some big fish lost, but that don't count. We generally do better on the first day, but the weather has been too cold lately to expect good sport.—Geo. Kilian.

Trouting in Western New York.—Onondaga County, April 4.—Trout fishing opened on the 1st with a record of a few good strings. The veteran trout fisher, Charles Bebee, caught thirty-three on the 1st, whose aggregate weight was three and one-quarter pounds. He also took two California mountain trout of three and four ounces each. Some persons from Syracuse brought in between forty and fifty fair trout. On the 2d, a friend and myself fished two brooks and took twenty trout of quite good size. The two largest weighed one and a half pounds. I also took a mountain trout of about two ounces in weight.—Geo. A. Knapp.

The attention of salmon fishers is called to the Boston advertisement for three or four rods. It is from a gentleman whom we know.

Trout and Electricity.—In one of the tanks belonging to Mr. Blackford in Fulton Market, is a collection of live trout from James Annin, Jr., of Caledonia, N. Y., one of which is a lake trout of four pounds weight. The tank is one of those that have an electric light suspended in the water, and is made of slate with glass on the front and back. An iron pipe enters a hole near the top of one end for the supply of water, and another pipe connects at the bottom of the other end. There is a board cover which keeps the fish from jumping out. One morning since the trout show the fish in this particular tank were noticed to be in a state of excitement, which was so violent that the passers-by stopped to see what was the matter. They rushed about, and tried to jump out for about two minutes, and then turned on their backs. One of the attendants jumped to take out the fish, and on putting his hands in the water received a shock which nearly floored him. Recognizing the cause of the trouble he took out the wire, which had become detached somehow, and he left the fish in the tank to see if they would revive. In twenty minutes they recovered and were swimming about as if nothing had happened. No doubt a few minutes more in the electric current would have killed them.

Michigan Fish Laws.—Detroit, April 5.—*Editor Forest and Stream:* Your correspondent, "S. E. B.," calls upon me to state why the Fish Commissioners allow the slaughter of fish to go on in violation of the law. In the first place, the Commissioners have no more to do with the enforcement of the law than any one else has. If "S. E. B." will read the law he will see whose duty it is. To ask the Commissioners to attend to the enforcement of law, and pay their own expenses for the benefit of men too cowardly to act themselves, is absurd. We give our time to the work of the Commission without charge now, and it takes a great deal of labor and time to carry on our work. Will "S. E. B." please tell me where he finds the law he quotes and the authority for saying the Commission will prosecute, etc. I do not know of any such law nor of any act on the part of the Commission that could even give color to such a report. When the law is passed making it the duty of the Commission, and they to be paid for their time and expenses, they will see that the law is respected. We hope to be able to have a law passed creating game and fish wardens, etc.—A. J. Kellogg, Fish Commissioner.

Salmon in Scotland.—*Editor Forest and Stream:* A letter just received by me from Henry Wright, Esq., secretary to the Duke of Sutherland, states that the salmon fishing in Sutherlandshire, Scotland, this season is exceptionally good. He writes: "One of my friends was there for seventeen days, fished fifteen and caught seventy-eight, weighing 790 pounds. A party of six fishing one river showed over fifty salmon, on their return to the hotel, in one day, and on the other rivers it has been proportionately good. I told one man at Brora (near Dunrobin Castle), who fishes with nets for the market, that he might go to Loch Brora and have a haul. He did and got 398 fish, weighing 3,960 pounds. I don't mean in one haul, but one day's hauling, say eight or ten hauls. The country is beginning to look lovely, the fruit trees just coming into full bloom, and the grass green."—Geo. Shepard Page.

A Fly Preventer.—A common prescription to keep off flies and mosquitoes is a solution made by soaking or boiling quassia chips in water. Although highly recommended by some of those who have tried it, it nevertheless often proves ineffective. Something like the quassia remedy in its character is the following, taken from the Sydney (Australia) *Tribune:* "A reader, Namoi River, states that he has found that by washing his hands and face in a weak solution of bitter aloes, he has escaped annoyance from the attacks of mosquitoes, even in localities where they are most troublesome. He has also found that his horses benefited in a like manner by giving them a wash down with the same liquid." We print it for the purpose of asking our readers if any of them have ever tried it, and if so, with what result. To many people the ordinary smear of tar and oil is only less disagreeable than the insects themselves.

A Handsome Trout.—On Monday we received a box containing one two and three-quarter pounds trout, sent with the compliments of Mr. A. Weeks. The fish was taken near Locust Valley, on the north shore of Long Island, where they have access to salt water. It was as shapely a fish as one ever sees, and its light silvery sides shaded off to a delicate pink underneath. It was a fish that should have been immortalized on canvas. If, as is claimed, the trout of Long Island are the handsomest in the country, this was one of the most beautiful of Long Island trout.

Fishculture.

AN ENGLISH FISHCULTURAL FARM.

LAST week we noticed the arrival of 10,000 eggs of the English trout at the Cold Spring Harbor station of the New York Fish Commission. The following is an account of the place from which they came, written by Mr. R. B. Marston, of the London *Fishing Gazette:*

The other day, in response to a long-standing invitation, I paid a visit to Mr. T. Andrews, the pisciculturist, of Westgate House, Guildford, in order to see his place generally, and to arrange about a shipment of 10,000 English trout eggs, which are to be sent as a present from the *Fishing Gazette* to the American Fishculture Association.

I found Mr. Andrews in his hatching house busy looking over his magnificent stock of ova and fry. Fish-breeding seems to agree with Mr. A., for he looks the picture of a man who takes things easily, and always seems jolly and contented. One would hardly suppose that he had the care of the finest fish farm and breeding-place in England, and a large business besides. He commenced fish-breeding as an amusement many years ago, and soon found such a demand for his eggs and fry that he had to go in for it thoroughly, and it now pays him splendidly. In addition to his large hatchery at his house, he has, a few miles off, a system of no less than forty ponds fed by springs, and ranging in size from two acres down to a few square yards. In these ponds he keeps his yearling trout and his parent fish, and some idea of the magnitude of his fish farm may be got from the fact that at the present moment he has about 40,000 trout in these ponds. Not having seen them, I must reserve a description of the ponds for another visit; suffice it to say they are all admirably arranged, are staked to prevent poaching, and the water can all be drawn off by means of iron sluice valves, and they are, besides, so efficiently watched that poachers have no chance.

In the hatchery, Mr. Andrews has facilities for hatching over two millions of eggs during the season, and his annual "output"—if I may use this expression—often exceeds that number. Last year Mr. A. sold half a million trout fry and yearlings, and about a million eggs, and his prices for eggs range from 20s. to 40s. per 1,000, for fry from 30s. to 60s. per 1,000, and for yearling fish (5 to 8 inches in length), from £30 to £45 per 1,000.

He has at present about nine hundred thousand splendid trout eggs of various kinds in his troughs and trays. It was to me extremely interesting to witness this wealth of embryo trout life. Six hundred English trout eggs stocked the streams of Tasmania and New Zealand; here around me were sufficient to stock a universe. The ova was of different sizes and color, from a pale yellow to a deep orange. The largest eggs were a lot of hybrids, produced by crossing *S. ferox* and *S. salvelinus* (char). Then came a fine lot of great lake trout, which Mr. Andrews had obtained from Dr. Zenk. Some of these had already hatched out in a most promising manner. A cubic inch of ordinary (medium size) trout eggs number about 125—*i. e.*, five rows deep of twenty-five eggs. A gallon measure holds about 40,000 "fine" eggs. Mr. Andrews finds that equally good results are obtained by using "trays" instead of the old-fashioned "troughs." He can rely, as a rule, on an average of over ninety per cent. of fry from every hundred eggs. As an instance of the advantage of the trays over the troughs, I may mention that while a trough 3 feet by 7 inches will only hold successfully about 7,000 eggs, trays 1 foot by 3 inches will contain 125,000. In addition to this, the trays are infinitely cleaner and more easy to manipulate. The trays are made of finely-perforated zinc, coated with ordinary tar varnish. Five of these trays fit into a wooden box, which contains the water, and are made with a flange turned outward; this is important, as the flange then supports the box when it is let into its place, and there is no difficulty in pouring out eggs or fry, as would be the case if the flange turned inwards. A tray 12 inches long, 6 wide and 3 deep will hold 30,000 eggs, and the water comes to within half an inch of the top, and the eggs lie 15 deep.

The following, respecting the cost of a box with five trays, will be useful:

	s. d.
Wooden box, 3 ft. by 5 in. deep	7 0
Five trays, at 2s. 6d. each	12 6
Lead piping, etc.	7 0
Total	£1 6 6

Mr. Andrews is fortunate in having a supply of excellent water, which is made to pass through three large cisterns, and thus settles down before it reaches the trays. He informs me—and it is a hint worth remembering—that water from a high pressure is too highly aerated, is unfit for respiration, and kills the fish. The following information is also most valuable: For twenty-four hours after being stripped from the fish, eggs can be washed and manipulated almost with impunity; then for three or four weeks and until "eyed" they are extremely delicate, and should be disturbed as little as possible. When fairly "eyed," they will stand an almost incredible amount of judicious manipulation; indeed, Mr. A. once upset a box of 25,000 eggs on to the floor and then swept them up without appreciably injuring them. In the garden are several large tanks for holding yearlings and other trout. Mr. Andrews netted out some of these to show me, including some very fine *fontinalis*. It would be impossible to imagine finer or more healthy-looking fish—not a trace of the imperfect gill covers, showing the red gills, as is so often seen in artificially-reared trout which have not been properly treated. I asked him what his opinion was of *fontinalis*, and he replied that they were splendid fish for ponds or any water where they can be prevented from escaping, but that they certainly do not answer in English rivers. This fully conforms what I have repeatedly stated in this paper.

Mr. A. related to me a most encouraging instance of how a river may be re-stocked. Some years ago he set his heart on a stream which he knew was capable of feeding trout to any extent. There were none in it then, as they had all been killed by the chemical refuse from a mill. The mill did not pay, and had been converted into a harmless factory of some kind, and the river had gradually regained its aquatic vegetation, and with it insect life. Without saying anything to any one, he placed about 20,000 fry into this stream, and in three years' time the river was so well stocked that a gentleman wrote to the *Field* to point out the wonderful manner in which a stream, if left to itself, will reproduce trout when the injurious refuse has been done away with.

Mr. A. quietly stepped in and explained the wonder in a very much more rational manner. He still continues, every year, to put a few hundred yearlings into it, and it is now probably, for its size, the best bit of trout water in the county of Surrey—the fish running very large.

In another case, he turned about twenty-five brace of trout (averaging two pounds each) into a tributary of the Wey, and now fish of four, five, and even eight pounds, are not uncommon.

It is pleasant to know that one who has unostentatiously done so much to increase that splendid fish, the trout, is himself an ardent and skillful fly-fisher. I spent a long time looking over his rods and flies, of which he has enough to stock a tackle shop. He showed me a capital fly-rod, made to his order by Mr. Bowness. It had duplicates of second, third, and top joints; these are carried by placing them so that the ends rest in a corner of a big "Freake" bag, the tops rest over the left shoulder, and Mr. A. is thus prepared for any accidents, and he gives his fish no more law than his tackle will permit. I confess, for my part, I should not like to be encumbered with any spare joints except a top in the landing net handle, as I do not remember having an accident with any other joint but once, and that was in dace-fishing at Teddington, when a heavy chub took the fly, and the quick strike required for dace smashed a bad bottom joint. But even Mr. Andrews' precaution would not have availed in this disaster, as he does not carry a duplicate butt.

THE GOLDEN IDE, OR ORFE.—Mr. Hugo Mulertt, of Cincinnati, in speaking of this fish, recently said: "This is a fish which is but little inferior to the trout in gameness as well as on the table; and then notice his brilliant colors. He is called the gold orfe, and is pre-eminently the aristocratic game fish of the world. He is to be found in the pond of every German nobleman, and, I must say, is worthy of every honor. These fish swim in schools near the top of the water, and in consequence are particularly fitted for fountains and ponds. They are perfectly hardy, may be left in the ponds all winter, and in a couple of years will sometimes reach the length of three feet." The recent flood in the Ohio River carried away a great stock of fancy fish from Mr. Mulertt's ponds, near Mill Creek. Among them were Japanese kingios, fringe-tails, telescope fish, golden orfe, and many other rare fishes. His loss is very great, and is to be regretted, as he is the only fishculturist in America who makes a specialty of ornamental fishes.

McDONALD FISHWAYS FOR SCOTLAND.—The Tay Fishery Board have decided to place a McDonald fishway on that river, and Col. McDonald will sail for Scotland in June to superintend its construction. This was suggested by a writer in the *Scotsman*, who said: "There are at least a dozen fishery districts in Scotland where impassable waterfalls shut out good spawning ground, and in the great majority of these districts there are district boards; and if the McDonald fishway be really as valuable a discovery as it is stated to be, why should not these boards arrange among themselves, and combine to bring the inventor over and let him try to open up the hitherto untouched spawning grounds on our upper waters? But it is not only to natural obstructions, in the shape of waterfalls, that the McDonald fishway would apply. It would also be invaluable, if its claims are well founded, in enabling salmon to ascend the numerous dams belonging to mills and manufactories which at present greatly retard, if they do not entirely prevent, their upward progress. The number of such dams is legion."

The Kennel.

FIXTURES.

BENCH SHOWS.

April 22.—The St. Louis Gun Club's Bench Show, St. Louis, Mo. Entries close April 14. J. M. Munson, Secretary.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1115.** Volume I., bound in cloth, sent postpaid, $1.50.

THE CLEVELAND DOG SHOW.

THE second show of the Cleveland Bench Show Association was held at Cleveland, O., last week. Like all of the shows superintended by Mr. Lincoln, it was well managed, and we are pleased to add, pecuniarily successful. The number and quality of the dogs was not quite up to that of the show held two years ago. There was a notable falling off in the English setter classes, while the pointer classes showed an improvement. The Irish setters were well represented, many of the best in the country being present. The black and tan setters were a mixed lot, with only two or three moderately good ones. The spaniels were fairly well represented, as were the beagles and fox-terriers. The collies were very good, both in numbers and quality. There was a meagre showing of large dogs, nearly all of the classes having but one or two representatives. The ladies' pets were out in force, and proved to be one of the most attractive features of the show.

A large number of the stalls were tastefully decorated, many of them displaying handsome boquets and wreaths of choice flowers. The building is rather small, and at times was uncomfortably crowded.

The judging was done upon a raised platform in the center of the building, affording the spectators a good view of the proceedings, which were watched with great interest, which often manifested itself in applause, as some favorite was given the blue. Major Taylor and Mr. Mortimer handled their dogs very nicely, and not much fault can be found with their awards. Mr. Munson was not quite so happy with the pointers, and some of his decisions were decidedly wrong. Major J. M. Taylor passed upon the merits of the setters, and Mr. J. M. Munson upon the pointers. Mr. J. F. Kirk was expected to judge the remaining classes, but business engagements prevented his presence, and Mr. James Mortimer very acceptably filled his place. In commenting upon the dogs, we deem it unnecessary to repeat our description of those that are well known. Many of the animals in a large number of the classes were sadly out of condition, both in flesh and coat, and quite a number were afflicted with mange and should not have been shown. The special prizes, which were very valuable, as well as handsome, were open to all, unless otherwise specified, and in most cases followed the awards in the regular classes. The performance of the trick dog was very good and afforded much amusement to the spectators. The Association will not hold a show next year, having an understanding with Pittsburg to alternate with them. It having been fully demonstrated that both Cleveland and Pittsburg can hold successful shows, it would be much better for each to hold them annually, as we are sure that both larger and better entries would follow.

SETTERS.

The English setters were not so well represented as they were two years ago. Major Taylor's Lit was on exhibition. She is not a bench show winner, but the fame of her victory last winter over the celebrated Grouse Dale secured for her quite an ovation. Royal Ranger had a walk over in the champion dog class. He has settled together and improved in form since we last saw him, although he was shown in very bad condition, which was in part due to his having been hunted until recently. He was also suffering from mange. Dick Laverack, the only other entry, was absent, as were all of Mr. Davey's entries. In the bitch class, Nellie May, who was in capital condition, won over Lady May, who was not at her best. Nellie May is a sweet little bitch, with no very weak points. She lacks a little in bone. Lady May is also a capital bitch, rather above the medium size, of good form, with plenty of bone. We thought her deserving of the ribbon, notwithstanding her feet were not so good as Nellie's. In the open dog class, first went to Count Gladsome, a very nice upstanding dog of much quality. He was not in good condition. Laverack Chief, who won second, is also quite a good dog. He was in even worse condition than Count. Don, who was placed third, has not the quality of the others, although he is a well put together useful-looking dog. Chief Justice, hc., is a big workmanlike-looking animal, with plenty of bone. He was shown too thin and soft. Napoleon, c., we liked for the three letters. He is well built, with a fair head, and has capital legs and feet. He looks all over a workman. We also liked Brandon, unnoticed. He has not a first-class head, but has a good chest, back, loin, legs and feet; he was not in good condition. None of the others were worthy special mention. In the bitch class, first and second went to Mr. Hartley's Queen Alice and Daisy Queen. Both deserved their honors, although they were all out of condition. Daisy, who won third, was the only one left worthy of notice. She is quite a fair animal. Dan Voorhees, in the dog puppy class, was an easy winner. He is a very promising youngster, with a nice head, and will probably be heard from again. Don, who won second, is a fair animal, but a bit big and inclined to be coarse. There was but one entry in the bitch class, Countess Floy. She is very pretty, and well deserved her ribbon.

The Irish setters, although only about about half as numerous as the English, were far ahead of them in quality. Glencho, who won in the champion class over Chief and Norwood, was looking better than we have ever seen him. He has filled out and overcome much of his leggy appearance, he has also improved in stifles, as we predicted, and we doubt if a better representative of the breed can be found. Chief was very well shown. He is also a hard dog to beat. Norwood we liked very much. He is a capital dog, but was not in so good condition as the others. Biz was absent. In the bitch class, Trix furnished quite a surprise party to the friends of Lady Clare. When both are at their best, there is not much to choose between them; but both were out of condition, owing to the cares of maternity, and Lady Clare had a little the worst of it. In the open dog class Snap, who was second at New York last year, was placed first. He has improved and was very well shown, as were all of Mr. Pierce's dogs. Mickey C., who won second, is also a very nice animal, with good head, chest, legs and feet, and a good flat coat. McCullough, vhc., is of good type, but was sadly out of condition. Chief II., c., is also well shaped. He was also in bad condition, and carried his tail too high. Conn, unnoticed, has a good head, and is well formed. Had it not been for his wavy coat he would probably have been noticed. In the bitch class, Reeta, the winner, had it all her own way. She was in good condition. The three others were litter sisters. All of them are very fair animals, of good form, but a little under size. We thought them well placed. Glenmar had an easy win in the puppy class. He is wonderfully developed for a six-months puppy, and is as hard as an old dog. If he goes all right he will be good enough for almost any company. Book, who was given second, is big and coarse, and should not have been noticed. Elcho IV., the only other entry, is not entitled to his name. He is a cross-bred and solid liver in color.

The black and tan setters, with the exception of three or four, were a poor lot. Rupert II. had a walk over in the champion class. He was not in very good condition. He has a good head and chest, with very rich tan markings; he might be better in stifles. There were no entries in the bitch class. Dark, who won first in the open dog class, is quite a fair animal. There was not much to choose between him and Mr. Brown, who won second. Jet, who won first in the bitch class, is also a fairly good animal. Nell, the only other entry, was very badly out at elbow, and the second prize was properly withheld. First was withheld in the puppy class, and second might have been also and no injustice done, as the winner was rather weedy and decidedly curly in coat.

POINTERS.

The entries in the pointer classes were just the same in numbers as two years ago, while the average quality of the animals was an improvement. In the champion large dog class Faust was given the pride of place. He was looking very well, considering his age, and is still a grand dog, although he has grown throaty and shows his years. Brownie also shows age, and was not well shown. Knickerbocker was looking better than when we saw him last. Vandevort's Don, the only other entry, was absent. Marguerite II. was alone in the bitch class. She is quite a good bitch, and deserved her honors. She has a good body with a straight back, a nice tail, with good legs and feet. Her head is quite plain, and she might be better in stifle, and greatly improved in condition. In the champion small dog class Jet had a walk over. He is too long coupled and light in bone to win in good company. There were no entries in the bitch class. In the open large dog class there were three moderate specimens, with not much to choose between them. Joe, who won first, has a fair head, good chest and shoulders, and good forelegs and feet. He is a bit leggy and lathy, and weak in stifles. Jacob, who won second, should have been content with third place. He has a fair head, but is coarse and has no quality: he is also leggy and lathy, and has a coarse tail. Ruff, c., we liked as well as either of the others. He has as good a head as either, and is much better formed; he has a good chest, body, loin, legs and feet; he is a bit wide in chest and of as ugly color as we ever saw. In the bitch class Countess Vesta, who was given first, is far from being a good specimen. She has a fairish head with a good loin and quarters; her ears are set on too high and her shoulders are bad; she is out at elbow and her fore feet are close together, giving her a very awkward appearance in front; she is also swaybacked and has a coarse, badly carried tail. Belona, who was second, should have been first; she clearly outclassed the others; she has a good head, body, legs and feet and tail; she is a little too wide in chest, and was not in good condition, having just weaned her litter. Fan II., vhc., we liked for second place; she is a fair specimen, with no glaring faults. Musette, hc., received all that she deserved; her head and eyes are bad.

In the open small dog class King, who won first, is a very good specimen of the old style pointer. He has a fairly good head, except that the occipital bone is not well developed. His neck is elegant and well set on. He has a good loin and quarters, fair legs and good feet. He is too wide and round in chest, and is a trifle too closely coupled; he is also let down just a bit behind the shoulders. He was in beautiful condition. Bang Bang, who won second, was clearly entitled to first, notwithstanding the bad condition in which he was shown. In no point except in condition was King his superior, while in most points that enlightened breeders deem of vital importance, Bang Bang was far ahead of him. Mr. Munson claims that Metcor is very near perfection. Now we venture to say that there is not a prominent pointer in the country who approaches Meteor in type so nearly as Bang Bang. Donald II., vhc., is a fine big dog and shows considerable quality. He is a trifle lathy and a little too straight behind. The others that were noticed were perhaps as well placed as was possible, except that Match, unnoticed, should, if the judge was right, have had at least vhc. He resembles the winner in form more than any in the class, and well deserved a place. In the bitch class there was not much to choose between first and second, both are quite good. Lady Croxteth had a little the best of it in head, but in other respects they are nearly equal. Rose II., vhc., is fairly well formed, but she has a bad head, and is too wide in front. Dora, hc., is quite a nice bitch, and gives promise when matured, of turning out a good one. Dora, unnoticed, is also quite good, and deserved the three letters, although she has just weaned her litter, and was not in good condition. The dog puppy class brought out two good ones. Both are well formed and promise well. They were very well shown. The bitch class was not quite so good. We thought them properly placed.

SPANIELS.

The Irish water spaniels were particularly good. Barney was alone in the champion class. He has been at work and was not in his usual good condition. In the open class, first went to Ponto, a very nice specimen of excellent type, but rather small. Patsy O'Connor, who won second, is also a capital dog, with a very good coat. He carries his tail badly. Aleck, vhc., has a good coat and plenty of bone. He is well formed, but is too square on muzzle, and a little off color.

Benedict, the only entry in the champion field spaniel class, was absent. In the champion cocker class, Bene beat the only other entry, Hornell Dinah. Bene is a very nice little bitch, with plenty of bone and a capital coat. She might be better in head. Her ears are also a trifle short. In the open class for field spaniels, Hornell Maggie won first. She is a very good bitch, but was not in first-class condition. Burdette Bob, who won second, we did not like so well. He is too high on his legs and has not a good coat, and, judging from the many scars he carries, his disposition is not of the best.

Cocker spaniels, other than black, was a poor class. Nellie, a black, was ruled out on account of her color, and Hornell Rattler, the only one left worthy of notice, was given first. He has a good head and good length of body, with plenty of bone. His ears are rather small, and set on too high. Macduff and Queen Ann are both toyish in appearance and curly in coat, and not deserving the hc. they received. In black cockers, first went to Hornell Silk, a capital little dog, with a good coat and body and plenty of bone. He is just a bit high on his legs. Rosa, who won second, has a good body and a fair amount of bone. She is weak in head, and her coat is slightly curled. Hornell 101 is good in body and bone, but has not a good head. In the puppy class, Ross, who was first, is a nice black, with good body and bone, but a bad coat, which may improve with age. The second prize was withheld. Nellie, who was hc., got all that she deserved. She is well made, but is too small.

FOXHOUNDS.

Ringwood was the only entry in the champion foxhound class. He was looking well, and deserved his medal. In the open class Ringwood II. won first. He has a good head and shoulders and plenty of bone. He is just a trifle slack in loin and might have better feet. Gabriel, who won second, has a good head and ear and lots of bone, and a capital set of legs and feet. He is a trifle throaty, and is not good in back and loin. Sport, vhc., is a good stamp of dog, but is too straight in shoulder and moves badly. Leader, hc., has plenty of bone, but has a poor head and ears, and lacks quality.

BEAGLES.

Rattler, who won in the champion class, was not looking his best. Lill, the only other entry, is a good bitch. She is a bit short in ears and begins to show age. The open dog class was very good, King Pat, who was placed first, is a very nice little dog with a good head and ear, deep chest and good feet. He seems a bit weak at knee joints. Boxer III., who was second, has good bone legs and feet. He is only fair in head and body and carries his ears a trifle high. Dell, vhc., has a good head with lots of bone. He is out at elbows, and has too fine a coat. Minstrel, c., we liked for a better place. He is a grand little dog with first-class body, legs and feet. His head is a bit heavy, and we do not quite like the hang of his ears. He was suffering from mange, which undoubtedly set him back. There were three very good ones in the bitch class. Mischief, who won first, has a beautiful head, good ears, which are nicely carried, good bone, legs and feet; she is a trifle weak in loin. Bonnie, who was second, is a very sweet little bitch of much quality; she is rather light in build. Lill II., vhc., is very well made, but is a bit too high in her legs, were it not for this fault she would have been a good second. There was only one entry in the puppy class, quite a promising youngster.

DACHSHUNDE.

There were only three in this class. Prince, the winner, is a very good specimen. He has a good head, with good length of body, plenty of bone and crook. Brunhilde, who won second, is not quite so good as the winner in length of body or crook. Waldman K., vhc., we liked better for second place, although he was not in good condition.

FOX-TERRIERS.

Fennel had it all his own way in the champion dog class, out-classing Dick, his only competitor, at every point. In the bitch class, Thistle was also an easy winner, beating Ruby in bone and coat. Lyra was absent. In the open dog class, Vakeel, who won first, is a very taking dog, full of character. He has a good head, with nice, well-carried ears, a good neck well set on to good shoulders, and a dense coat. He is slightly out at elbow, and might have better feet. Belvoir Jim, who won second, is also quite good. He has good shoulders, legs and feet, and looks like a workman. He is a bit thick in skull, and stands a trifle too high on his legs. Greek, vhc., is a nice little dog all through, but rather too small. Grip, hc., received more than he was worth. He lacks character, has large ears and open feet. Pouf, c., should also have been unnoticed. He is large and coarse, with a poor head and is short of coat. Village Belle, who won first in the bitch class, is all over a terrier, and the only one in the class that the judge noticed, a decision with which we agree. First was withheld in the puppy class; second was given to Vixen, a very moderate specimen.

GREYHOUNDS.

Spring Custer was the only greyhound present. He shows age, but deserved his ribbon for his good back, loin and quarters.

DEERHOUNDS.

There was but one entry in this class, Garfield, who was given first. He is a magnificent dog in front, and not at all bad at any point, except that he has a bad tail which he carries much too high.

MASTIFFS.

Lion, the winner in the champion mastiff class, is a well-made dog with a good skull and legs; he moves very well. He falls away below the eyes and is off color, and has too much white on chest and feet. Tiny, the only other entry, we consider a much better specimen, but he was in wretched condition, and should not have been shown. Agrippa, the only entry in the open dog class, well deserved his prize. He has a good head, and is well formed, with lots of character. He is undersize, which is his most serious fault. There were but two in the bitch class. Cleopatra, who won first, has developed into a grand animal. She is well formed, with a good head and muzzle, and is full of quality. Duchess, who won second, is also very good, but does not show quite the quality of the winner.

ST. BERNARDS.

Otho, the only entry in the champion rough-coated dog class, is of immense size and bone. He has a massive head and stands 33 inches at shoulder. He was very low in flesh, which gives him a leggy, gaunt appearance. Lady Abbess, by mistake, was entered in the champion class, but was transferred to the open class. In the open dog class, Hermit was alone. He well deserved his first. He has a massive typical head and plenty of bone. He is rather light in body, and was out of coat. Lady Abbess, who won first in the bitch class, was in much better condition than when we saw her at Loudon last fall. She has a good body, bone, coat and color, and is nicely marked. She might be more massive in head. Santa, who was second, is of good size and bone, but has a very poor head and a badly carried tail. There were no entries in the smooth-coated champion dog class. In the bitch class Daphne was alone. She has a good body with immense bone and a very good coat, she might be better in head and tail. In the open dog class Bishop, quite a nice orange and white dog, easily won over his kennel companion, Bonhomme, who is disfigured by having a pig jaw. Chartreuse, the only entry in the bitch class, was given first. She has a nice head and good body but is a little short of bone.

NEWFOUNDLANDS.

The Newfoundlands were a poor lot. Watch, the winner, is fairly good, with a good body and coat. He is deficient in head and lacks bone. Mackaboy, who won second, has a good coat, legs and feet, but has a poor head and is slack in loin. York, vhc., is an immense dog, and except that he has a retriever coat he was the best in the class. The others were unworthy mention.

COLLIES.

Rex and Lorne were the only competitors in the champion dog class, Rex winning the medal. Except that Rex is just a trifle better in head and ear, we thought Lorne the best. He is fully as well formed, and has a better coat. He did not carry himself so well as his stylish rival, which we presume lost him the race. Lassie had a walk over in the bitch class. She was heavy in whelp, and did not show to advantage. The open dog class was very good indeed, with not a bad one in it. Yarrow, the winner, does great credit to his sire, Rex. He is a very handsome, stylish dog, with a beautiful head and ears, good legs and feet, and lots of bone and a very graceful mover. He was trifle short of undercoat. Hiram, who won second, has not improved in condition, being as usual much too fat. There was not much to choose between the others, all of them were good with no glaring faults. The bitches were also a good lot and deserved their awards. Fairy, who was first, was in excellent coat. Flyaway, second, has greatly improved and, but for her light coat, would have made it very warm for the winner. The dog puppies were a promising lot, with not much between the three that were placed. We fancy that Roy, who was placed behind the others, will show them the way next year. Nannie O. had no trouble in winning over Olive, her only competitor in the bitch class. Olive, however, is very promising, and may do better when mature.

BULLDOGS.

Boz, the only entry in the champion class, was not at his best. In the open dog class, Brimstone, placed first, has a good skull, but is rather plain in face and has a terrier body and tail. The second prize was properly withheld, as were all prizes in the bitch class.

BULL-TERRIERS.

In the large class the first prize was withheld, and no great injustice would have been done had the same been done with the others. There was but one entry in the small class, Little Maggie, quite a nice little bitch of correct type.

WIRE-HAIRED OR SCOTCH TERRIERS.

In this class Heather, a very good bitch, with a capital terrier head, beat Tam Glen, who is a very typical dog, but not quite up to the winner in head. The others were all good and

not very much behind the winners. We liked Nibs the Tramp full as well as any except the first two. He is a varmint-looking customer, and if the class were turned loose among rats we will warrant that he would not be the first to quit.

BLACK AND TAN TERRIERS.

This was also a good class, in which Vortigern, although defeated for both first and second place, was not disgraced, as both of the winners were sired by him. They are both of good form and well marked. Spring, hc., is well made, but is off in color and markings. Nell, c., deserved more than she got as she is a very nice little bitch, although rather too small.

DANDIE DINMONTS

were both absent.

IRISH TERRIERS.

We could not quite agree with the judge in placing Erin over Norah. Erin has a good coat and color, but he is not first-class in head and lacks bone, while Norah has a good head with plenty of bone and a fair coat.

SKYE TERRIERS.

There were no entries of Skyes except in the prick-eared class which brought out three good ones in our old favorite Judge and two of his get; we thought them properly placed.

PUGS.

Joe was alone in his glory in the champion class. He was not in his usual blooming condition. In the open dog class first went to Treasure. He is a well made dog with good skull, mask and wrinkle. He is a bit coarse in coat, but will probably improve as he grows older. Punch, who won second, is good in head and body but is deficient in mask, and has white toe nails. Pete, vhc., is a very nice specimen, much better than Punch, except that he is blind in one eye. The others we thought well placed. The bitches were fairly good, the winner is very nice with correct markings. She carries her ears badly, which is her most serious fault. The remainder of the class as well as the only puppy call for no especial comment.

YORKSHIRE TERRIERS.

Hero, the only entry in the champion class, deserved his medal. He was in good coat, although it was a trifle faded. In the open class, over 5lbs., first went to Tiney, a nicely-colored dog, a trifle short in coat. The others, as well as those in the small class that received notice, were all fair specimens that call for no special comments.

TOY TERRIERS

were all quite good. Dot, the winner, was a nice little black and tan, with correct markings.

KING CHARLES OR BLENHEIM SPANIELS.

Rosie, quite a nice little black and tan King Charles, was the only one shown. She was a little short of coat and feather.

ITALIAN GREYHOUNDS.

The only entry was absent.

POODLES.

Bennie, a good coated corded gray, was awarded first; second went to a well shaped white and black, who was hardly close enough in curl.

MISCELLANEOUS.

This class was quite good, Sir Garnet, who won first, is quite a good Airedale terrier. Foreigner, who won second, is a four months old bloodhound, who promises to turn out a good one. He is good in skull, eye and ear, and has good length of body with immense bone. He is short of flew and wrinkle, but may improve with age. The others call for no special mention except Fritz, vhc., who is an exceedingly clever trick dog. Following is a full list of the

AWARDS.

Class 1. Champion English Setters, Dogs,—1st, Howard Hartley's Royal Ranger, lemon belton, 3yrs., Royal IV.—Shorthose Novel.

Class 2. Champion English Setters, Bitches.—1st, D. O'Shea's Nellie May, blue belton, Blue Dash—Jolly May.

Class 3. English Setters, Dogs.—1st, John Overman's Count Gladsome, white, black and tan, 2½yrs., Champion Gladstone—Lelia; 2d, A. C. Waddell's Laverack Chief, black, white and tan, 3½yrs., Pontiac—Fairy II.; 3d, L. G. Hanna's Don, black, white and tan, 2½yrs. High com., R. B. Carothers's Chief Justice, black, white and tan, 2yrs., Byron—Reign. Com., B. F. Wilson's Napoleon, black and white, 28mos., Royal Blue—Lady Vin; Charles Willard's Jake, white and black, 3yrs., Penn—Nettie; S. A. Kaye's Brackett, orange and white, 4yrs., Gladstone—Clip.

Class 4. English Setter Puppies, Bitches.—1st, Howard Hartley's Queen Alice, black, white and tan, 4yrs., Druid—Cubas; 2d, Howard Hartley's Daisy Queen, black, white and tan, 3yrs., Rock—Meg; 3d, Jacob King's Daisy, blue belton, 2yrs., Felton—Jessie Turner. Very high com., B. F. Wilson's Dashing Romp, 4yrs. 7mos., Dash II.—Norna. High com., Roe Reisinger's Annie Boleyn, black and white ticked, 12mos., Dash III.—Isabella. Com., A. C. Waddell's Queen Alice II., black, white and tan, 18mos., Laverack Chief—Queen Alice; S. A. Kaye's Druid's Maid, lemon and white, 3yrs., Druid—Lady-of-the-Lake; S. A. Kaye's Nannie, black, white and tan, 5yrs., Blue Dash—Sport.

Class 5. English Setter Puppies, Dogs, under 12mos.—1st, P. B. Spence's Dan Voorhees, black, white and tan, 10mos., Chief Justice—Nancy Lee; 2d, G. Tilke's Don, lemon and white, 11½mos., Duke—Peg.

Class 6. English Setter Puppies, Bitches.—1st, J. H. Dalliba's Countess Floy, black, white and tan, 9mos., Count Noble—Floy.

Class 7. Champion Irish Setters, Dogs.—1st, W. H. Pierce's Glexcho, dark red, 2yrs. 10mos., champion Elcho—champion Noreen.

Class 8. Champion Irish Setters, Bitches.—1st, William Kemble Lente's Trix, dark red, champion Elcho—champion Fire Fly.

Class 9. Irish Settters, Dogs.—1st, W. H. Pierce's Snap, red, 2yrs. 9mos., champion Chief—Tilley; 2d, H. E. Chubb's Mickey C., red, 2yrs., Karl—Irish Countess. Very high com., Charles A. Willard's McCullough, red, 20mos., Duncan—Maud. Com., H. P. Goetschius's Chief II., red, 3yrs., Chief—Doe.

Class 10. Irish Setters, Bitches.—1st, Jas. T. Walker's Reeta, red, 3yrs. 11mos., Elcho—Fire Fly; 2d, Frank Billings's Nora II., red, 2½yrs., champion Biz—Nora. Very high com., H. E. Hill's Maggie H., red, 2½yrs., champion Biz—Nora. High com., George Randerson's Red Daisy, red, 2½yrs., champion Biz—Nora.

Class 11. Irish Setters, Puppies.—1st, W. H. Pierce's Glenmar, red, 6mos., champion Glencho—Mavourneen; 2d, George W. Short's Book, red, 10mos., champion Glencho—Mollie.

Class 12. Champion Black and Tan Setters, Dogs.—1st, Franklin Kennel's Rupert II., black and tan, 4½yrs., Rupert—Queen.

Class 13. Champion Black and Tan Setters, Bitches.—No entries.

Class 14. Black and Tan Setters, Dogs.—1st, E. Nutting's Dash, black and tan, 5yrs., Jan—Diana; 2d, Miss L. Walton's Mr. Brown, black and tan, 4yrs., champion Grouse—Topsey. Com., E. B. Seidel's Bob, black and tan, 5yrs., pedigree not given.

Class 15. 1st, H. R. Parker's Gip, black and tan, 2yrs. 3mos; 2d, withheld.

Class 16. Black and Tan Setters, Puppies.—1st, withheld; 2d, Geo. P. Covert's Lilly, black and tan, 7mos.

Class 17. Champion Pointers, Dogs, over 55lbs.—1st, S. A. Kaye's Faust, liver, white and ticked, 8yrs., Sefton's Sam—Pilkington's Nell.

Class 18. Champion Pointers, Bitches, over 50lbs.—1st, H. W. Fawcett's Marguerite, liver and white, 4½yrs., champion Faust—Devonshire Lass.

Class 19. Champion Pointers, Dogs, under 55lbs.—1st, W. R. Huntington's Jet, black, 3½yrs., Frank—Lady.

Class 20. Champion Pointers, Bitches, under 50lbs.—No entries.

Class 21. Pointer Dogs, 55lbs. and over.—1st, T. H. Dalliba's Joe, liver and white, 29mos., pedigree not given; 2d, J. H. Kirkwood's Jacob, liver and white, 4yrs., pedigree not given. Com., Theo. F. Spencer and George R. Butler's Ruff, lemon and white, 3yrs., Dilley's Ranger—Dilely's Fleet.

Class 22. Pointer Bitches, 50lbs. and over.—1st, S. A. Kaye's Countess Vesta, liver, white and ticked, 4yrs., imported Donald—imported Bell II.; 2d, Westminster Kennel Club's Belona, lemon and white and ticked, 5yrs., champion Bow—Beulah. Very high com., A. C. Waddell's Fan II., liver, 2½yrs., Bow—champion Fan. High com., S. A. Kaye's Mussette, liver and white, 4yrs., Bow—Queen.

Class 23. Pointer Dogs, 55lbs. or under.—1st, A. C. Waddell's King, liver and white, 2yrs., Clipper—Dove; 2d, Westminster Kennel Club's Bang-Bang, orange and white, 3yrs., champion Bang—Princess Kate. Very high com., C. M. Munhall's Donald II., liver and white ticked, 19mos., champion Donald—Devonshire Lass. High com., John R. Daniels's Snap Shot, orange and white, 14mos., Bob III.—Fan; B. F. Seitner's Riot, liver and white, 18mos., Lort—Lass. Com., Adam Baker's Don, liver and white and ticked, 18mos., Rush—Nelly; J. W. Shannon's Dash, liver and white, 4yrs., pedigree not given; Tuscarawas Kennel Club's King Bow, Jr., liver, white and ticked, 23mos., King Bow—Chess.

Class 24. Pointer Bitches, 50lbs. or under.—1st, B. F. Seitner's Lady Croxteth, liver and white, 2yrs., Croxteth—Lass; 2d, B. F. Seitner's Lass, lemon and white, 4yrs., Sleaford—Dawn. Very high com., S. A. Kaye's Rose II., lemon and white, 4yrs., Sensation—Rose. High com., J. H. Dalliba's Dora, liver and white, 12mos., champion Sensation—Devonshire Lass. Com., Joseph Lewis's Lilly, lemon and white, 3yrs., Fawcett's Duke—Owner's Spell.

Class 25. Pointer Dog Puppies.—1st, B. F. Seitner's Rapp, liver and white, 11½mos., Croxteth—Lass; 2d, B. F. Seitner's Doncaster, liver and white, 11½mos., Croxteth—Lass.

Class 26. Pointer Bitch Puppies.—1st, G. W. Baker's Ray, brown and white, 10mos., Brownie; 2d, Fred W. Stocky's Brownie, liver and white, 7mos., Brownie—Unknown.

Class 27. Champion Irish Water Spaniels.—1st, John D. Olcott's champion Barney, liver, 7yrs., Shamrock—Shannon.

Class 28. Irish Water Spaniels, Dogs or Bitches.—1st, Cleveland Irish Water Spaniel Kennel's Ponto, liver, 2yrs., champion Barney—Nora; 2d, C. W. Baire's Patsy O'Connor, dark liver, 2yrs, imported Dan O'Connor—Traller. Very high com., G. W. Baker's Aleck, liver, 5yrs.

Class 29. Champion Field Spaniels, any color, 28lbs or over.—Only entry absent.

Class 30. Champion Cocker Spaniels, any color, under 28lbs.—1st, Dr. J. T. Niven's Bene.

Class 31. Field Spaniels, any color, 28lbs. or over, Dogs or Bitches.—1st, Hornell Spaniel Club's Hornell Maggie, black, 3yrs., Bob III.—Fan; 2d, Hornell Spaniel Club's Burdette Bob, black, 3yrs., Leigh's Bob—Venus.

Class 32. Cocker Spaniels, other than black, under 28lbs., Dogs or Bitches.—1st, Hornell Spaniel Club's Hornell Rattler, 11½mos., chestnut and tan, champion Dandy—Dinah; 2d, withheld. High com., A. G. Dayken's Macduff, liver and white, 1½yrs., Brandy—Lady, and Queen Ann, liver and white, 2yrs., imported.

Class 33. Black Cocker Spaniels, under 28lbs., Dogs or Bitches.—1st, Hornell Spaniel Club's Hornell Silk, black, 18mos., champion Obo—Chloe II.; 2d, Dan O'Shea's Rosa, black, 16mos., Doctor—Dolly. Very high com., Hornell Spaniel Club's Hornell 101, black, 16mos., champion Benedict—Priu.

Class 34. Spaniel Puppies (any color)—1st, B. F. Lewis's Ross, black, 10mos., imported; 2d, withheld. High com., Thomas Neal's Nellie, liver and white, 5mos., Brandy—Fan.

Class 35. Champion Foxhounds, Dogs or Bitches.—1st, Dan O'Shea's Ringwood, black, white and tan, 3yrs., Forester—Lady.

Class 36. Foxhounds, Dogs or Bitches.—1st, Dan O'Shea's Ringwood II., black, white and tan, 18mos., Ringwood—Rocksy; 2d, John H. Sweet's Gabriel, black, white and tan, 19mos., Snifter—Jacobs. Very high com., Peter Knierin's Sport, black, white and tan, 5yrs. High com., H. F. Knowles's Leader, white and tan, 5yrs., Bouncer—Fido.

Class 37. Champion Beagles, Dogs or Bitches.—1st, Dan O'Shea's Rattler, black, white and tan, 2yrs., Rover—Music.

Class 38. Beagles, Dogs.—1st, C. E. White's King Pat, white, tan and black, 21mos., Searcher—May Belle; 2d, Fulton Kennel Club's Boxer III., white, black and tan, 15mos., Our Boxer II.—Lill. Very high com., R. & W. Livingston's Dell, A.K.R. 319. Com., W. H. Ashburner's Minstrel, black, white and tan, 2yrs., imported from England.

Class 39. Beagles, Bitches.—1st, Dan O'Shea's Mischief, black, white and tan, 2yrs., Rover—Music; 2d, Mrs. C. E. White's Bonnie, black, white, tan and ticked, 21mos., Searcher—May Belle. Very high com., Fulton Kennel Club's Lill II., white, black and tan, 15mos., Boxer II.—Lill. Com., C. Wm. Fromm's Stella, black, white and tan, 16mos., Spottie—Nina.

Class 40. Beagles, Puppies.—1st, Windsor T. White's Mac, white, black and tan, 10wks., Pilot—Minnie.

Class 41 Dachsunde, Dogs or Bitches.—1st, B. F. Seitner's Prince, fallow red, 14mos., Bergman—Gretchen; 2d, J. P. Shaefer's Brunhilde, fallow red, 14mos., Bergman—Gretchen. Very high com., Carl Klocke's Waldman K., black and tan., 4yrs., Waldman—imported Waldine.

Class 42. Champion Fox-Terriers, Dogs—1st, R. Gibson's Fennel, black, white and tan, full pedigree.

Class 43. Champion Fox-Terriers, Bitches.—1st, R. Gibson's Thistle, black, white and tan, full pedigree.

Class 44. Fox-Terriers, Dogs.—1st, John T. Cable's Vakeel, white, black and tan, 2½yrs., champion Volo—champion Spikepole; 2d, R. Gibson's Belvoir Jim, black, white and tan, full pedigree. Very high com., S. C. Graff's Greek, white with black and tan on head, 14mos., Fennel—Fay. High com., Frank T. Moorehead's Grip, black, white and tan, 15mos., Belgrave Joe—champion Nettle. Com., W. B. Sterling's Pouf, white, black and tan, imported.

Class 45. Fox-Terriers, Bitches.—1st, John T. Cable's Village Belle, white, black and tan, 2yrs. 9mos., champion Volo—Beauty; 2d, withheld.

Class 46. Fox-Terriers, Puppies.—1st, withheld; 2d, M. J. Kelly's Vixen, lemon and white, 6mos., pedigree unknown.

Class 47. Greyhounds.—1st, Dave Marshall's Spring Custer, fawn, 8yrs.; McGraw—Mirror.

Class 48. Deerhounds, Dogs or Bitches.—1st, Jacob Krieger's Garfield, fawn, 2½yrs., imported.

Class 49. Champion Mastiffs, Dogs.—1st, Jas. H. Lynch's Lion, fawn, 28mos., Salisbury—Tigress II.

Class 50. Champion Mastiffs, Bitches.—No entries.

Class 51. Mastiffs, Dogs.—1st, Shaw & Bates's Agrippa, A.K.R. 449.

Class 52. Mastiffs, Bitches.—1st, Dr. J. W. Alsop's Cleopatra, A.K.R. 258; 2d, Shaw & Bates's Duchess, A.K.R. 260.

Class 53. Mastiff Puppies, Dogs or Bitches.—No entries.

Class 54. Champion Rough-Coated St. Bernards, Dogs.—1st, Fred W. Rothera's Otho, A.K.R. 483.

Class 55. Champion Rough-Coated St. Bernards, Bitches.—No entries.

Class 56. Rough-Coated St. Bernards, Dogs.—1st, Chequasset Kennel's Hermit, A.K.R. 23.

Class 57. Rough-Coated St. Bernards, Bitches.—1st, Fred W. Rothera's Lady Abbess, A.K.R. 432; 2d, H. B. Sherman's Santa, orange, white and tawny, 15mos., Monk II.

Class 58. Champion Smooth-Coated St. Bernards, Dogs.—No entries.

Class 59. Champion Smooth-Coated St. Bernards, Bitches.—1st, Fred W. Rothera's Daphne, A.K.R. 488.

Class 60. Smooth-Coated St. Bernards, Dogs.—1st, H. B. Sherman's Bishop, white and orange, 2½yrs.; 2d, H. B. Sherman's Bonhomme, orange and white, 2yrs., Webb's Rex—Theon, A.K.R. 94.

Class 61. Smooth-Coated St. Bernards, Bitches.—1st, H. B. Sherman's Chartreuse, orange and white, nearly 2yrs., Rex—Brunhilde.

Class 62. Newfoundlands, Dogs or Bitches.—Wm. Sellers's Watch, black, 4yrs.; 2d, A. C. Johns's Mackaboy, jet black, 14mos. Very high com., James McKay's York, black, 6yrs. High com., Jacob Kreiger's Prince, black, 3yrs. Com., Chas. Eilert's Nero, black, white points, 3yrs.

Class 63. Champion Collies, Dogs.—1st, Jas. Lindsay's Rex, black, tan and white, 5yrs., Carlyle—Elcho.

Class 64. Champion Collies, Bitches.—1st, Fred. W. Rothera's Lassie, A.K.R. 445.

Class 65. Collies, Dogs.—1st, Charles A. Otis, Jr.'s Yarrow, black, white and tan, 18mos., champion Rex—Beauty; 2d, James Lindsay's Hiram, sable and white, 10mos., Rex—Kittie Mac. Very high com., Edith M. Fasig's Mac, black, white and tan, 11mos., imported Captain—imported Topsy. High com., Frank T. Moorehead's Scot, black and tan, 2yrs., Lord Rayton—Cloudy; G. W. Evans's Trump, black and tan, 2yrs., champion Rex—Belle. Com., Dr. W. C. Fair's Bobby Burns, black and tan, 2yrs., champion Rex—imported Lassie.

Class 66. Collies, Bitches.—1st, James Lindsay's Fairy, sable and white, 10mos., Rex—Kitty Mac; 2d, James Watson's Flyaway, sable and white, 3yrs. and 8mos., champion Rex—champion Flora. Very high com., G. W. Evans's Evans's Nell, sable and white, 6yrs., Pattison's Davey—Bell. High com., W. A. Jeffrey's Letta, black and fawn, 12mos., Gaffer—Josephine II.

Class 67. Collies, Puppies, Dogs.—1st, Edith M. Fasig's Mac, black, white and tan, 11mos., imported Captain—imported Topsy. Very high com., G. W. Evans's Sandy, sable and white, 6mos., Trump—Nellie. High com., W. A. Jeffrey's Roy, black and tan, 5mos., Bruce—Lukie.

Class 68. Collies, Puppies, Bitches.—1st, James Lindsay's Nannie O., black, white and tan, 10mos., Rex—Kittie Mac. Very high com., G. W. Evans's Olive, sable and white, 6mos., Trump—Evans's Nellie.

Class 69. Champion Bulldogs, Dogs or Bitches.—1st, R. & W. Livingston's Boz, brindle and white, 3yrs. in June, Gamester—Browse's Betsy.

Class 70. Bulldogs. Dogs.—1st, J. P. Barnard's Brimstone, white, yellow, ears, 2yrs., Bonny Boy—champion Judy; 2d, withheld.

Class. 71. Bulldogs, Bitches.—Prizes withheld.

Class 72. Champion Bull-Terriers, over 25lbs., Dogs or Bitches.—Absent.

Class 73. Bull-Terriers, over 25lbs., Dogs or Bitches.—1st, withheld; 2d, Wm. Veale's Countess, white, 2yrs., Spot—Nellie. High com., Wm. Veale's Ben, lemon and white, 2yrs., Spot—Belle.

Class 74. Champion Bull-Terriers, under 25lbs., Dogs or Bitches.—No entries.

Class 75. Bull-Terriers, under 25lbs., Dogs or Bitches.—R. & W. Livingston's Little Maggie, A.K.R. 525.

Class 76. Wire-Haired or Scotch Terriers, Dogs or Bitches.—1st, John H. Naylor's Heather brindle, 2yrs.; 2d, John H. Naylor's Tan Glen, dark gray, 19mos. Very high com., Dan O'Shea's Boxer, wheaten, 3yrs., Major—Lady; W. H. Little's Buster, Bedlington terrier, 12mos., Sting—Wasp. High com., Weddel House's Nibs, the Tramp, gray, 8yrs.

Class 77. Black and Tan Terriers, Dogs or Bitches, over 7lbs.—1st, Edward Lever's Lady, black and tan, 1½yrs., Vortigern—Lillie; 2d, John Whitaker's Brilliant, black and tan, 1½yrs., Vortigern—Lillie II. Very high com., Edward Lever's Vortigern, black and tan, 5yrs., champion Viper—Gipsy. High com., H. A. Kistemann's Spring, black and tan, 2yrs. Com., Charles Stalley's Nell, black and tan, 1yr.

Class 78. Dandie Dinmont Terriers, Dogs or Bitches.—Absent.

Class 79. Irish Terriers, Dogs or Bitches.—1st, Dan O'Shea's Erin, red, 2yrs., Tim—Nora; 2d, Dr. J. S. Niven's Norah, red, 4yrs., Spring—Nettie.

Class 80. Champion Skye Terriers, Drop-Eared, Dogs or Bitches. No entries.

Class 81. Champion Skye Terriers, Prick-Eared.—No entries.

Class 82. Skye Terriers, Drop-Eared, Dogs or Bitches.—No entries.

Class 83. Skye Terriers, Prick-Eared, Dogs or Bitches.—1st, L. G. Hanna's Judge; 2d, L. G. Hanna's Flora II. Very high com., L. G. Hanna's Bloss.

Class 84. Champion Pugs, Dogs.—1st, Mrs. George H. Hill's Joe, fawn, 4yrs., champion Comedy—Clytie.

Class 85. Champion Pugs, Bitches.—No entries.

Class 86. Pugs, Dogs.—1st, Chequasset Kennel's Treasure, pale fawn, black points, 11mos., imported Fritz (A.K.R. 569)—imported Banjo; 2d, H. A. Kistemann's Punch, 2yrs. Very high com., L. G. Hanna's Ponto, fawn, 3yrs.; Mrs. E. V. Jewell's Pete, fawn, 5yrs. High com., Thos. W. Cockerill's Butler, fawn, 26mos.

Class 87. Pugs, Bitches.—1st, T. S. Dumont's Gipsy, fawn, 18mos., imported; 2d, Mrs. H. L. Taylor's Taffey, buff, 20mos. Very high com., Mrs. E. E. Bieman's Jennie, fawn and black, 1½yrs., imported; Anton Petrey's Sallie, stone fawn, 3½yrs., Punch—Judy.

Class 88. Pugs, Puppies, Dogs or Bitches, under 12mos.—1st, Anton Petrey's Prince, stone fawn, 6mos., Peter—Sallie.

Class 89. Champion Yorkshire Terriers, Blue and Tan, Dogs or Bitches.—1st, H. A. Kistemann's Hero, champion of the world, blue and tan, 3yrs.

Class 90. Yorkshire Terriers, Blue and Tan, over 5lbs., Dogs or Bitches.—1st, Miss Jennie Axworthy's Tiney, blue and tan, 2yrs., imported; 2d, H. A. Kistemann's Prince, blue and tan, 1½yrs. Very high com., H. Schmidt's Dot, 2yrs. High com., Wm. Keegan's Tip, blue and tan, 9mos., Dandy—Nibs.

Class 91. Yorkshire Terriers, Blue and Tan, under 5lbs., Dogs or Bitches.—1st, H. A. Kistemann's Crickey, blue and tan, 2yrs.; 2d, H. A. Kistemann's Lillie, blue and tan, 1½yrs. Very high com., P. F. McGue's Nellie, blue and tan, 2yrs., imported. Com., Wm. Keegan's Belle, blue and tan, 2yrs., Billy—Beauty; Thos. Blake's Topsy, blue and tan, 12mos.

Class 92. Toy Terriers, other than Yorkshires, under 5lbs., Dogs or Bitches.—1st, F. J. Hovlechek's Dot, black and tan, 16mos., Tip—Pippy; 2d, H. A. Kistemann's Flora, tan, 2yrs. Very high com., S. H. Wilson's Tina, black and tan, 1yr.

Class 93. King Charles or Blenheim Spaniels, Dogs or Bitches.—1st, H. A. Kistemann's Rosie, black, white and tan, 1½yrs.

Class 94. Japanese Spaniels, Dogs or Bitches.—No entries.

Class 95. Italian Greyhounds, Dogs or Bitches.—Absent.

Class 96. Poodles.—1st, Jacob Zuellig's Bennie, gray, 3yrs.; 2d, Jacob Zuellig's Prince, white, black ears, 2yrs. Very high com., Miss S. M. Cohrs's Prince, white, 11yrs.

Class 97. Miscellaneous or Foreign Class.—1st, Ed. Leuer's Sir Garnet, blue and tan, 2yrs., Airedale terrier, champion Crack—Gypsy Queen; 2d, Dan O'Shea's Foreigner, bloodhound, black, white and tan, 4mos., Lassie—Slave Boy; equal 3d, H. L. Stanton's Moody, black and tan, 2yrs.; H. L. Stanton's Sankey, black and tan, 2yrs. Very high com., W. Fleming's Jep, flesh color, 2yrs., Mexican hairless dog; A. C. Cozad's Fritz, fawn and white, 21mos., Maltese terrier. Com., Chas. Hogg's Fanny, white with black spots, 8yrs., Dalmatian.

SPECIAL PRIZES.

A.—For the Irish setter bitch having won the greatest number of first and special prizes, Mr. Thos. Axworthy, gentleman's traveling valise, value $50; won by Lady Clare, J. S. McIntosh.

B.—For the best kennel of spaniels, not less than six, B. & S., brass jug, value $45; won by the Hornell Spaniel Club.

C.—For the best brace of cocker spaniels, B. & S., bronze plaque, value $25; won by Hornell Rattler and Hornell Silk, Hornell Spaniel Club.

D.—For the third best pug, S. H. Wilson, fishing rod and reel, value $12; won by Pete, Mrs. E. V. Jewell.

E.—For the best smooth-coated collie, Messrs. P. L. Miles & Co., silver medal, value $10; won by Lassie Regis, the Scottish Chief's Kennel.

F.—For the best rough-coated collie owned in Cuyahoga county, Mr. George Forbes, canary bird and cage, value $10; won by Mac. Edith M. Fasig.

G.—For the best Yorkshire terrier owned in Cleveland, Messrs. Edwards and Fasig, fancy inkstand and buckhorn penholder, value $15; won by Tiney, Miss Jennie Axworthy.

H.—For the best Irish water spaniel, Hon. John Farley, silver duckhead scarf pin, value $18; won by Barney, John D. Olcott.

I.—For the best pointer bitch under 50lbs., Mr. W. H. Corning, picture and easel, value $20; won by Lady Croxteth, B. F. Seitner.

J.—For the best bull-terrier, Mr. W. H. Corning, bronze dog, value $15; won by Little Maggie, R. & W. Livingston.

K.—For the best English setter dog puppy, Bank street Hackmen, bronze dog, value $15; won by Dan Voorhees, P. B. Spence.

L.—For the best bull, dog or bitch, Mr. Crittenden, painted antique pitcher, value $25; won by Boz, R. & W. Livingston.

M.—For the best pug bitch, Mr. Henry Beekman, silk umbrella, value $10; won by Gipsy, T. S. Dumont.

N.—For the best King Charles or Blenheim spaniel, Messrs. Benton, Meyers & Co., pair of vases, value $10; won by Rosie, H. A. Kistemann.

O.—For the best beagle dog, Messrs. S. Ranney & Son, pair hunting shoes, value $10; won by Rattler, Dan O'Shea.

P.—For the best black and tan terrier, over 7lbs.; won by Lady Edward Lever.

Q.—For the best toy terrier, under 5lbs.; won by Dot, F. J. Hovlechek.

R.—For the best Newfoundland; won by Watch, Wm. Sellers.

S.—For the best foxhound in open class, Mr. Wm. Rhode, lamp, value $7; won by Ringwood II., Dan O'Shea.

T.—For the kennelman showing the greatest number of animals of any class in the best bench show condition; won by B. F. Lewis.

U.—For the best English setter bitch puppy, Mr. J. F. Chadwick, picture, value $15; won by Countess Fly, J. H. Dalliba.

V.—For the best English setter dog in the best condition in the open class, owned in Cleveland, Mr. C. E. Gehring, picture, value $25; won by Don, L. G. Hanna.

W.—For the best brace of English setters, Messrs. Rice & Burnett, silver tea set, value $25; won by Brigand Chief and Queen Alice II., A. C. Waddell.

X.—For the best brace of Irish setters, Mr. J. F. Ryder, picture value $20; won by Glencho and Snap, Wm. H. Pierce.

Y.—For the best black and tan setter dog, Mr. C. A. Selzer, plaque, value $10; won by Dash, E. Nutting.

C.—For the best collection of sporting dogs entered from Canada, Mr. N. Wilson, stove, value $20; won by Dan O'Shea.

AA.—For the best pointer dog in the open classes, owned in Cleveland, Mr. Henry Chubb, pair game pieces, value $20; won by Joe, T. H. Dalliba.

BB.—For the best prick-eared skye terrier, Mr. J. Palmer O'Neil, fishing rod, value $15; won by Judge, L. G. Hanna.

CC.—For the best English setter bitch in the open class owned in Cleveland, Mr. Geo. Bashington, brass stand mirror, value $10; won by Daisy, Jacob King.

DD.—For the best English setter dog, Mr. Geo. W. Cady, antique brass plaque, value $10; won by Count Gladsome, John Overman.

EE.—For the best Irish setter puppy, Mr. W. C. Ball, silver flask, value $8; won by Glenmar, W. H. Pierce.

FF.—For the best Irish setter bitch in the open class, Reeta, James T. Walker.

GG.—For the best collie, Mr. J. B. Perkins, picture, value $20; won by Yarrow, Chas. A. Otis.

HH.—For the best spaniel puppy, Mr. M. Ryan, silver cup; won by Ross, B. F. Lewis.

II.—For the best mastiff, Mr. W. A. King, collar and whip, value $15; won by Cleopatra, J. W. Alsop.

JJ.—For the best wire-haired or Scotch terrier, Messrs. Sigler Bros., fruit dish, value $8; won by Heather, John H. Naylor.

KK.—For the best collie bitch puppy, Messrs. S. H. Foster & Co., box cigars; won by Nannie O., Jas. Lindsay.

LL.—For the best pointer dog, Mr. E. Beach, picture, value $15; won by Faust, S. A. Kaye.

MM.—For the best smooth-coated St. Bernard, Messrs. Short & Foreman, ivory paper cutter, with rest, value $20; won by Bishop, H. B. Sherman.

NN.—For the best rough-coated St. Bernard, Mr. David Johnson, bronze donkey, value $10; won by Hermit, Chequasset Kennel.

OO.—For the best pointer dog puppy, Mr. Fred Diebold, case of fruit knives, value $10; won by Rapp, B. F. Seitner.

PP.—For the third best poodle, Messrs. Arnold & Hurd, work basket; won by Prince, Miss S. M. Cohrs.

QQ.—For the fourth best dog or bitch in miscellaneous class, Mr. G. H. Mack, box of cigars; won by Sankey, H. L. Stanton.

RR.—For the best pug dog in open class; won by Treasure, Chequasset Kennel.

SS.—For the best black and tan setter bitch, Messrs. E. M. McGillen & Co., pair vases, value $15; won by Gip, H. R. Parker.

TT.—For the third best prick-eared Skye terrier; won by Bloss, L. G. Hanna.

UU.—For the best fox-terrier dog in the open class, Messrs. Colwell & Hubbard, silver fruit dish; won by Vakeel, John T. Cable.

VV.—For the best fox-terrier bitch in open class, Mr. W. Murray French vase, value $7; won by Village Belle, John T. Cable.

WW.—For the third best beagle dog in open class, Mr. A. T. Kinney, box cigars; won by Dell, R. & W. Livingston.

XX.—For the third best beagle bitch in open class, Mr. F. W. Slosson, box cigars; won by Lill II., Fulton Kennel Club.

YY.—For the third best dachshund; won by Waldman K., Carl Klocke.

ZZ.—For the best sporting dog owned by a lady, in Cleveland; won by Bonnie, Mrs. C. E. White.

AAA.—For the best setter or pointer shown in the best bench show condition, the Cleveland Clothing Company, hunting coat; won by Don, Adam Baker.

BBB.—For the best brace of pointers, the Excelsior Clothing Company, hunting coat and vest; won by Faust and Countess Vesta, S. A. Kaye.

CCC.—For the best collie in open class, the Cleveland Gun Store, revolver; won by Yarrow, Chas. A. Otis, Jr.

DDD.—For the best trick dog, Mr. J. Powers, revolver; won by Fritz, A. C. Cozad.

EEE.—For the best Yorkshire terrier over 5lbs; won by Hero, H. A. Kusenann.

FFF.—For the best Irish water spaniel in open class, Messrs. Likely, McDonald & Rockel, leather gun case; won by Ponto, Cleveland Irish Water Spaniel Kennel.

GGG.—For the best pointer bitch over 50lbs., Mr. C. A. Selzer, plaque; won by Marguerite II., H. W. Fawcett.

HHH.—For the best Irish setter owned in Cleveland, Messrs. McIntosh, Good & Huntington, carving set; won by Book, G. W. Short.

III.—For the best Italian greyhound, the Medford Fancy Goods Company, collar; not awarded.

JJJ.—For the best terrier owned in Cleveland, the Medford Fancy Goods Company, collar; won by Tiney, Miss Jennie Axworthy.

KKK.—For the best pug owned in Cleveland, the Medford Fancy Goods Company, harness; won by Pete, Mrs. E. V. Jewell.

LLL.—For the best pointer dog owned in Cleveland, the Medford Fancy Goods Company, collar; won by Joe, T. H. Dalliba.

MMM.—For the best pug, won by Joe, Mrs. G. H. Hill.

SPANIEL AND BEAGLE CLASSIFICATION.

Editor Forest and Stream:

During the past two or three years many of your prominent contributors have written you complaining of the lack of sufficient classes and a dearth of prizes, offered by the Westminster Kennel Club for spaniels and beagles, at their annual shows. As their suggestions and requests for a different classification have been fruitlessly made, I had intended renewing the same this year, not only as the opinions expressed were those held by most breeders, but more particularly as the number of entries in the past have warranted a more liberal classification.

But—too late—I find their premium list already issued, and therefore, after reviewing the classification for the above-mentioned breeds, I am induced to make a few miscellaneous comments regarding this classification, as it seems to me to be further from what it should be than previously, in that the classification remains as before, with the exception that liver-colored spaniels are included in the black classes. The objections to this I state below.

I had advocated, as had your many other contributors, that black or black and white, or if the white is allowed, more properly in my opinion black, white and tan, be separated from other than the above; that dogs be separately classed from bitches, as is done with all the above classes be made for those weighing over 28 pounds, *i. e.*, for field spaniels, as well as for those under 28 pounds, cockers. This year the W. K. C. make a new departure in separating the spaniel colors into two classes, namely, black and liver, and other than black and liver.

Not only have we no distinct strain of liver-colored spaniels, but I believe liver color has no legitimate connection with the black as a class, although now and then a solid liver-colored puppy will creep into a litter of the best black strains, just as it will at times in a litter of Gordon setter puppies.

In making separate classes for blacks, it has usually been customary to allow white (and a good lot of it, too,) on chest and feet, while tan points have been barred. At New York, in 1882, I remember a fine bitch, which I think was good for second, if not first prize, which was ruled out for showing tan markings. I would suggest that in the black classes, so called, either white or tan be allowed, or that the white as well as the tan be barred, making the class one for solid blacks only. The former combination of colors is a natural one, and one apt to appear in a litter, and on the score of beauty, I think almost any one will prefer the tan to the white. Perhaps at the rate the little cocker is increasing they will be of sufficient numbers to warrant the formation of the two classses in the future, "solid blacks," and "black, white and tans."

I believe the class heretofore most complained of (and justly so) has been the puppy class. Here but one class is made for all spaniel puppies, blacks, liver, and whites, dogs and bitches. The number of entries in the past certainly have warranted a more liberal classification, as well as better prizes.

Looking over the Westminster Kennel Club's catalogue of 1883, I find there were sixteen entries in the spaniel puppy class at $3 each, while the first prize given was only $5, and the second one a medal; the prizes, of course, were out of all proportion to the amount of entry fees received. I find further, that for pointer and setter puppies there were ten classes; in all but two of these classes the number of entries was much less than in the spaniel class, while in all of them the prizes were double.

No class of hunting dogs has increased in numbers as well as favor with us of late years as much as the cocker spaniel, and the increase has probably been greater during the past year than any year previously, and as a result, the number of entries received, and so the necessity of a more liberal classification will probably be proportionately greater than heretofore. From private sources I have been informed that more good and typical cockers have been imported during the past year than in any previous year. I would therefore suggest to the W. K. Club that they act upon the very sensible suggestion which the FOREST AND STREAM made to the New Haven Kennel Club, namely: "That if the number of entries received be sufficient to warrant the same, that a further subdivision be made at the opening of the show."

In the spaniel classes I would suggest as follows: Class 61 to be divided either into "black, white and tan," and "other than black, white and tan," or that dogs be separated from bitches. I suggest this, supposing that not sufficient entries will be received to warrant a more complete classification, namely: "Black, white and tan" and "other than black, white and tan," and dog and bitch classes for each. Also, that in open cocker spaniel classes, dogs be separately classed from bitches, and in the puppy class the number of entries will probably warrant the separation of "black, white and tans" from others, and dog and bitch classes for each of these, and certainly the past shows have demonstrated the need of one subdivision, at least, here.

Until we are overburdened with spaniels bearing the title of "champion," which, by the way, is altogether too cheaply acquired in all breeds with us, as definite a classification as the above is not necessary for champion classes. But where each one of our numerous shows with its recognized right to turn out champion candidates, is capable of turning out four spaniels annually, which are barred into a champion class, one such class is certainly not sufficient, either dogs and bitches should be separated or black, white and tan from others.

The entry fees for the show, I observe, remain the same as last year, when they were advanced 50 per cent. above all other, and its own previous shows, while the amount of prizes has not been increased at all, Judging from the objection made last year I supposed it would be reduced to the customary amount.

I know of one very prominent breeder and judge who has often turned up as a first prize winner, who last year purposely remained away from the New York show on principle.

In another way the entry fee of bitches is nearly trebled, thus, to a great extent, still retarding the only worthy object of bench shows—the advancement of our breeding dogs. I quote from Rule No. 19: "An entry fee of $3 will be charged *for each animal* entered. The entry fee for litters of puppies whelped in 1884 will be $5." (The italics are mine.) Whether this means the entry fee is $5 to enter a bitch with a litter of puppies, or $5 in addition to the entry fee of the bitch, I do not know; but, viewing it in the most favorable light, I can give a practical illustration of one great objection to it. I have a bitch, a previous show winner, which I had intended entering, which is due to whelp so that her pups will be nearly three weeks old at the time of the show. Even if I desired to enter the pups to sell them, this would be useless at that age, and as a result, of course, personally, I would prefer to leave the pups at home, if possible. Practically, therefore, the entry fee for all bitches which may have unweaned litters is $5 or $8, whichever it may be. The W. K. C. write me that the mortality among puppies being great, they do not desire to encourage the entries of the same; but, as the exhibitor is the only one running any risk of a loss, I should say he should be allowed to use his own judgment in the matter without any extra bar. Therefore, if a fair extra fee be demanded for salable puppies, well and good; but an exception should certainly be made for all bitches which necessarily must be accompanied by their unweaned puppies.

The object of bench shows, as I stated above, is for the purpose of advancing the breeding of dogs, to allow breeders and admirers to assemble and obtain points and knowledge on the subject of breeding, which cannot be obtained in a better way than by criticising and expressing their views on the various animals shown. The entry fees to shows, therefore, should be the minimum fee which will keep out all dogs unworthy to be shown, and consequently induce the greatest possible number of good dogs to be entered. Two dollars as an entry fee does not appear too low for the purpose.

Nothing will be more likely to induce the owners of the best dogs to enter them than the shortening the length of shows from four to three days. Many owners of the most valuable field dogs refuse to enter their animals in a four-day show, owing to the danger they incur of contracting distemper, or some other disease from the additional mental excitement undergone on a fourth day. Where a dog goes the rounds of the several shows, the additional mental strain undergone on a fourth day at each show, on the naturally very nervous system already wrought up perhaps almost to frenzy by the noise and excitement, is far greater than one can imagine, and out of humanity as well as for the sake of the dog's health, this fourth day should be abolished.

I should like to ask the opinions of show managers and breeders on an idea I have often thought of, namely: Would not the entries to shows be increased, and the shows be benefited, by annually arranging a "circuit," as it were, of the shows for the season, beginning, for instance, in the most Western city offering a show, and working Eastward; the following week showing in the next nearest place offering a show, and so on, or vice versa, East to West. As regards the extra expense breeders who desire to follow all the shows are put to in the way of railroad fares and express charges, to say nothing of the wear and tear on the dogs from the much greater length of time they must be crated up, no more forcible illustration can be given than the arrangement of the shows this year. Starting at Cincinnati, almost at the doors of Cleveland, Washington and New York are passed by to reach New Haven. Then to reach Washington this ground is again passed over. Toronto is then reached by again passing New York. Cleveland is then visited. In order to show at New York that city is visited for the fourth time, and if, as last year, Chicago concludes to hold a show later, it caps the climax by causing the useles 1,200 mile ride from Cleveland to New York and return.

And now I ask, would not many more exhibitors, breeders especially—and they are the largest exhibitors—show their stock, if a circuit had been arranged which would have done away with two-thirds at least of the present expense. For instance, had the shows been arranged to follow each other weekly, thus, Chicago, Cleveland, Cincinnati, Washington, New York, New Haven, and Toronto. Not only would better and fuller shows be given, but places on the route as, for instance, Pittsburg, Philadelphia, and Boston, which otherwise cannot draw sufficiently owing to the expense exhibitors incur in reaching them, would be able to give shows. All my above comments I think, will be pertinent to all shows and, I think indorsed by many of your readers.

As my communication has reached a much greater length than I intended, and though I am in the ranks with him in spirit, I shall leave the question of beagle classification to your genial correspondent "O. W. R.," who, last year, with several others, pleaded for his little musical pet. As yet the beagle has not increased in numbers and favor among us as his admirers would wish that he might, and as he should have done, simply because, as we have not been made sufficiently well acquainted with him, we have not been able to appreciate him. His musical tongue as he now strikes the trail of popular favor is just beginning to be heard, and he is just about two years behind the cocker spaniel. The American English Beagle Club, together with the encouragement given by the FOREST AND STREAM, will do for the beagle what the American Cocker Spaniel Club has done to bring the little cocker into notice, and, as a result, into favor.

SPORTSMAN.

A FOX HUNT.

THE first snowstorm awakened the "brush gatherers," a gleaner of wheat in a business letter added a feminine luxury a P. S., saying that the tarnal foxes had carried off some more chickens. Charlie, Captain and the writer secured a team and drove out to the scene of carnage. After interviewing the writer of the postscript, who said that 'ere pesky fox had carried off his favorite leghorn, and the critter had a nest about a mile from his house. After a survey of the country we drove over to the Hadley meadows. We were joined here by Henry and Mott with Boissy and Frank, the hounds. We always took Henry for his ability to see game; he will see more foxes in one day than ever stood in Hampshire county. Casting off the hounds at the edge of the pines, they did not go more than twenty rods before they gave tongue. Reynard made for the hills, and the hounds were doing their duty with legs and voices. The writer was given a station by a massive elm; Henry was to take the team and go over the hill. We took a long look at the team, which we never expected to see again. If Henry had seen any fox he would have left the team to the tender mercies of the Humane Society and tried to bag the fox, or at least did on one of our former hunts, and after walking home a good six mile walk. The conversation during that walk was not very lengthy but pointed. The fox, after making a trip for his health among the hills, evidently thought the fertile valley good enough for him. On reynard's return tour he had to come in the direction of the writer, who was endeavoring to keep warm, having that day put on a pair of boots which would have fitted better had his feet been smaller. Having heard from old settlers that by taking off your boots and rubbing snow on your feet they would be warm at once. The snow being applied, and circulation not increasing at the rate desired, the writer took a walk or rather a run. After getting away from the big elm, and hounds were making considerable noise, casting my optics in the direction of my assigned position the fox was passing between me and my gun. There seemed to be a "bluish" vapor in that section, after going back to my boots, which were shaked on so quick that the straps tore off. My heart was heavy, and I did not enjoy very good health, the symptoms had increased greatly within the past few moments. I went to the nearest farm house and happily there was a team going to town, and the same conveyed the writer. There were three brushes secured that day; two by Charlie and one by Henry, and his fox was frozen. Whether he shot the fox or got him out of a trap is a question. FLICK FLICK.

HARTFORD, Conn.

THE NEW YORK DOG SHOW.

THE special prizes offered for the Westminster Kennel Club's bench show, to be held next month at Madison Square Garden, are as follows:

The Eastern Field Trials Club offer a club medal, suitably engraved, for the best pointer dog, pointer bitch, English setter dog, English setter bitch, Irish setter dog, Irish setter bitch and black and tan setter that have been placed at any of the field trials that have been held in America.

The Westminster Kennel Club offer a club medal, suitably engraved, for the best kennels of large-sized pointers, small-sized pointers, English setters, Irish setters, black and tan setters and collies. Each kennel to consist of not less than five. Also to the best black English setter, best setter or pointer that retrieves in the most stylish and obedient manner, fastest greyhound, to be decided by heats, highest leaping greyhound and best trick dog. Best pug, dog or bitch, in the open classes, $25; best collection of five pugs owned by one exhibitor, $10.

Members of the club offer for the best pointer dog, the get of Sensation, $15; for the best bitch, $10.

The Medford Fancy Grods Company offers a suitable collar for the best pointer dog, pointer bitch, English setter, Irish setter, St. Bernard, mastiff, pug, bulldog, collie and greyhound.

WITHHOLDING PRIZES.

Editor Forest and Stream:

I returned a few days ago from a hurried trip to the Washington dog show, and was disappointed in not seeing as fine an exhibit as they had last winter. The pointers were good, decidedly the best in the show as a class. There were some good setters, notably Plantaganet, who was in splendid condition and carried off the champion prize. The mastiffs, St. Bernards and Newfoundlands were decidedly poor. Last year all these classes were very fine. I noticed that some prizes in several of the classes were withheld, I suppose for want of merit; in fact I have noticed it has been done at almost all the shows. This seems to me to be wrong. I understand that the dogs entered at bench shows are judged by a scale of points (Stonehenge's or some other). The prize list reads thus: "For the best English setter other than pure Laverack, $15; second, $5." Now, does not that mean that the dog entered that comes nearest to the scale of points by which the class is judged is entitled to the first prize, and so on?

I can't see how it can mean anything else, and I don't see how any judge of a show can throw out my dog, if he is the only one entered in his class, for want of merit. I have paid my entrance money and am entitled, according to the reading of the prize list, to first prize if he is a pure bred dog of that breed, no matter how poor a specimen he may be. The words "for the best" can't, it seems to me, mean anything else than "for the best one entered." Again, what is the scale of points by which dogs are judged? and how do you arrive at the merit of the dogs? He gets so much, as I understand it, for the measurement of his different parts, according to a certain standard. How can we arrive at this unless the measurement is actually made (that is, such parts as require measurement)? But no such measurement is made as far as I have ever seen.

There has never, as I have heard, been any number of points of merit adopted, to which a dog must attain in order to win first, and if this is not so, then the best one entered and shown in the classes, it seems to me is clearly entitled to win. I heard some complaints in Washington in regard to this custom, from owners of dogs which were there thrown out, and this has suggested the idea of writing this letter. I am not a disappointed exhibitor, and if I am wrong in the position I take, I would like to see the subject discussed and put right. I have acted as judge at a good many agricultural fairs and never yet saw any animal or fowl refused the premium offered for the best for want of merit. The judges of bench shows are not selected (or ought not to be) to say which dogs, or whether any, have merit enough to win a prize, but to say which in his judgment shall have it. The moment I pay my money into the treasury of the show, I am entitled to first prize if my dog is the best in his class, that faces the judge, whether he be a Plantagenet or not, or whether he will score one hundred or only ten points of merit, so he be the best dog shown.

If this were not so, I should never show a dog to be thrown out at the option of a judge who differed with me, when no other dog was shown against me. If this custom is right according to any rule of the shows, then the sooner it be abolished the better for the shows. No two men judge alike; one man will throw out a dog for want of merit that some other man would think entitled to first place. A dog may be shown at one time and place in the pink of condition and be placed, and when next shown be out of condition and be put at the foot of the list. Yet he is the same dog, as far as the scale of points is concerned. LEX.

[Before submitting his argument, "Lex" should have examined the *lex loci*, to be found in Rule 6, which says that "no prize will be awarded in any class where no dog possesses sufficient excellence to entitle it to the prize.]

EXPERIENCE WITH DOGS.

LEST "Flick Flick" shall think that I am a being without reason, and use the whip upon dumb creatures as a master upon the slave, I will, in a few lines, explain why a dog should be taught to retrieve under the whip. In most hunting dogs there is an inheritance which prompts them to pursue game, and so deeply rooted is this instinct, that to follow it is their greatest source of pleasure. Hence it is that a perfect bird dog can be made, by simply guiding this talent which is bred within him. We do not teach the dog to hunt, this he does naturally. We only teach him to hunt in the way our own experience has taught us is the most effective in bagging game. The dog supplies the motive power, we lay the rail which guides him to the destination we desire him to arrive at. Retrieving is to a certain extent an inheritance to which all dog flesh is heir; the mongrel will grab up an old shoe and race about with it in play, and almost anything with a bark can be taught to fetch on land or in the water, but the passion is not as strong as that which urges the pointer or setter, under a broiling sun, or through thorns and brambles to catch the delicious scent of the quail or grouse. Dogs tire of play, as do men. They think it sport to rush through water which is tempered by a summer's sun, but they shrink from an element which sends a shiver through every muscle of their body. I have never yet seen the dog trained as "Flick Flick" suggests, and but very few that would brave the cold water of spring or the late fall.

For instance, I once owned a pointer which I trained to retrieve in the manner suggested by "Flick Flick," and he worked elegantly. One day in my absence my room mate exhibited him to some friends, and kept him romping after a ball until he was very tired. He refused to fetch, was whipped for his impertinence, and forever afterward refused to retrieve. I had a spaniel that was forever on the watch for something to carry, but cold water, after one or two introductions, would curb his spirit to such an extent that no urging could force him on, and the sight of a whip would so completely quench him that he would be entirely useless for hours afterward. Now for the remedy for such perverseness

in our trusted friends. When I advise to train a dog to retrieve under the whip I do not mean that any cruelty should be practiced. The lesson to be taught the pupil is this: that when he is told to retrieve he must do it. If agreeable to him so much the better; if not, that he must do it just the same. This does not require any brutality. An even temper will enforce the lesson, and not a blow be struck which would call a whimper to the lips of a child.

I have a spaniel now, which, when I first adopted him, was a perfect fool. My sporting friends all laughed at me for allowing such a "kyudle" (?) to follow me about. He had been raised by a "cullud pusson," and was a type of all that is worthless. Raise your hand at him and he would fall on his back, feet in air, and tail close to his body, and there he would stay; endearments were wasted upon him and cuffs only constricted his tail. I handled him gently; first making him hold an object in his mouth. After a while I induced him to pick an object from the floor, and then my labor was practically over, the balance was simply extending the range of the instruction, the hardest step of which was to teach my pupil to pick an object from the floor at command. This dog was gun shy and water shy, and was eighteen months old before I ever spoke a word to him. Last fall he retrieved fairly for me in all kinds of weather, and before another year is passed, I venture to say that he will be as good a duck dog as any one would wish to own. This dog could never have been coaxed to retrieve. He did it because he had to at first.

A dog trained under the whip to retrieve will never fail you in hot weather or cold. If he is not so trained and if the whip is used to correct him at his first disobedience he will refuse to retrieve for the time, at least, perhaps for all time as did my pointer. HUNT.

ST. PAUL, Minn.

N. A. K. C. DERBY.

Editor Forest and Stream:

I inclose balance of entries for the fifth annual Derby of the National American Kennel Club. There are 88 in all, of which 74 are English setters, 5 Irish setters and 9 pointers. I think there will be the largest field of starters this year that we have ever had, as the entries did not close until after the distemper season was past, and the death rate will not be so great. There may be a few more entries by delayed and foreign mails. D. BRYSON, Sec.

MEMPHIS, Tenn.

ENGLISH SETTERS.

KENWOOD.—Montague Smith, Forest, Ont., blue belton dog, April 21 (Cambridge—Marchioness Peg).

GLADIATOR.—Samuel S. McCuen, New Orleans, La., lemon and white dog, Oct. 19 (Gladstone—Dido II.).

SPORTSMAN.—J. W. Murnan, Keeling, Tenn., black, white and tan dog, Aug. 21 (Gladstone—Sue).

FLOUNCE.—J. W. Murnan, Keeling, Tenn., lemon and white bitch, March 11 (Druid—Ruby).

MORSE.—Rogers & Dalton, N. Albany, Miss., black and white dog, Oct. 16 (Gladstone—Nellie).

BLUESTONE.—Rogers & Dalton, N. Albany, Miss., black, white and tan dog, Oct. 16 (Gladstone—Nellie).

MARSHALL NEY.—Rogers & Dalton, N. Albany, Miss., black and white dog, Oct. 16 (Gladstone—Nellie).

MISS CLIFTON.—E. S. Gay, Atlanta, Ga., white and lemon bitch, March 15 (Druid—Princess Draco).

CICILY B.—N. B. Nesbitt, Cedar Grove, Miss., black, white and tan bitch, Aug. 17 (Count Noble—Dashing Novice).

FIDGET.—N. B. Nesbitt, Cedar Grove, Miss., black, white and tan bitch, July 18 (Rake—Madam Llewellin).

PENDRAGON.—T. S. Dumont, New York, black, white and tan dog, June 11 (Count Noble—Floy).

LADY BLANCHE.—John S. Ormsby, Milwaukee, Wis., black, white and tan bitch, Aug. 28 (Count Noble—Rosalind).

PROSPECT.—L. J. Petit, Milwaukee, Wis., blue belton dog, Aug. 28 (Count Noble—Rosalind).

HARRY RYAN.—Capt. W. H. Key, Florence, Ala., blue belton dog, May 24 (Gladstone—Countess Key).

ANNE BOLEYN.—Rae Reising, Meadville, Pa., black and white bitch, March 23 (Dash III.—Isabelle).

PRAIRIE SCOUT.—R. B. Morgan, Akron, O., black and white dog, age not given (Count Blythe—Pearl).

PRAIRIE SUE.—R. B. Morgan, Akron, O., black and white bitch, age not given (Count Blythe—Pearl).

COUNT WESTLEY.—J. Palmer O'Neil, Pittsburgh, Pa., black, white and tan dog, Aug. 12 (Count Noble—Gertrude).

COUNT RICHARDS.—J. Palmer O'Neil, Pittsburgh, Pa., black, white and tan dog, Aug. 17 (Count Noble—Dashing Novice).

GLIDELIA.—Dr. C. Spahr, Bridgeville, Pa., black, white and tan bitch, Aug. 12 (Count Noble—Gertrude).

BLACKSTONE.—L. F. Paterson, Bainbridge, Ga., black, white and tan dog, June 3 (Roy—Gretchen).

ZOE.—B. M. Stephenson, La Grange, Tenn., black and white bitch, May 13 (Gladstone—Fawn).

RAPID ANN.—B. M. Stephenson, La Grange, Tenn., black, white and tan bitch, May 13 (Gladstone—Fawn).

INDEX.—J. M. Avent, Hickory Valley, Tenn., black, white and tan dog, July 10 (Gladstone—Countess Druid).

GLADSTONE'S IMAGE.—J. M. Avent, Hickory Valley, Tenn., black, white and tan dog, Oct. 5 (Gladstone—Bessie A.).

GLAD MOON.—J. M. Avent, Hickory Valley, Tenn., black, white and tan dog, Oct. 5 (Gladstone—Bessie A.).

JESSIE WINFIELD.—J. M. Avent, Hickory Valley, Tenn., black, white and tan bitch, Oct. 5 (Gladstone—Bessie A.).

ANNIE MORGAN.—J. M. Avent, Hickory Valley, Tenn., lemon and white bitch, Oct. 5 (Gladstone—Bessie A.).

LADY BESSIE.—J. M. Avent, Hickory Valley Tenn., lemon and white bitch, Oct. 5 (Gladstone—Bessie A.).

DASHING MONEY.—J. M. Avent, Hickory Valley, Tenn., lemon and white dog, May 18 (Dashing Monarch—Armida).

JACK W.—Col. A. G. Sloo, Vincennes, Ind., lemon and white dog, April 22 (Sergeant—Eva).

RICHMOND.—E. M. Usher, Vincennes, Ind., lemon and white dog, April 22 (Sergeant—Eva).

CLYDE T.—L. Shuster, Jr., Philadelphia, Pa., lemon and white dog, May 24 (Thunder—Cornelia).

ROD GLADSTONE.—D. C. Jones, Memphis, Tenn., black, white and tan dog, June 28 (Gladstone—Donna J.).

BLANCHE GLADSTONE.—Chas. Tucker, Stanton, Tenn., black, white and tan bitch, July 10 (Gladstone—Lavalette).

MISS DRUID.—Chas. Tucker, Stanton, Tenn., black, white and tan bitch, June 11 (Druid—May B.).

MAUD B.—Dr. Otto Moeber, Rowland, Ala., black, white and tan bitch, June 1 (Rollo—Morgo).

COUNT WIND'EM, JR.—J. R. Henricks, Pittsburgh, Pa., —— dog, age not given (Count Wind'em— ——).

BELTON'S BOY.—J. R. Henricks, Pittsburgh, Pa., black and white dog, Jan. 5, 1884 (Belton III.—Skip).

ROYCE.—W. B. Stafford, Trenton, Tenn., black, white and tan dog, May 26 (Rake—Phyllis).

COUNT.—W. B. Stafford, Trenton, Tenn., black, white and tan dog, Aug. 28 (Count Noble—Rosalind).

NOT NAMED.—Capt. Pat Henry, Clarksville, Tenn., black and white dog, Oct. — (Gladstone—Cammie).

NOT NAMED.—Capt. Pat Henry, Clarksville, Tenn., black and white bitch, Oct. — (Gladstone—Cammie).

FAUST.—A. W. Foster, Atlanta, Ga., black, white and tan dog, July (Prince—Anne Boleyn).

IRISH SETTERS.

LONELY DORA.—J. H. O'Reilly, Louisville, Ky., bitch, April 20 (Box—Rowena).

NOT NAMED.—W. E. Venable, Atlanta, Ga., dog, April 15; pedigree not given.

MINE.—W. A. McIntosh, Pittsburgh, Pa., bitch, Jan. 1 (Elcho—Flora).

SHAMROCK.—J. C. Vance, Chattanooga, Tenn., dog, Sept. 16 Captain—Gipsy Queen).

IRISH ROSE.—J. C. Vance, Chattanooga, Tenn., bitch, May 13 (Dan—Ruby).

POINTERS.

RICHMOND.—John E. Gill, Franklin, Pa., lemon and white dog, July 27 (Vandevort's Don—Beulah).

CYCLONE.—E. F. Stoddard, Dayton, O., liver and white dog, June 11 (Croxteth—Spinaway).

ROBERT LE DIABLE.—E. C. Sterling, St. Louis, Mo., liver and white dog, June 11 (Croxteth—Spinaway).

TOM COLLINS.—E. C. Sterling, St. Louis, Mo., liver and white dog, June 11 (Croxteth—Spinaway).
